Adjust the sensitivity so that the heights of the principal peaks in the chromatogram obtained with solution (4) are about 40% of full-scale deflection on the chart paper.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (4) is at least 1.5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.5%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than five times the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of flurbiprofen with 60 ml of 0.1M *sodium hydroxide* for 5 minutes, dilute to 100 ml with 0.1M *sodium hydroxide*, filter if necessary and dilute 10 ml of the filtrate to 100 ml with the same solvent. Further dilute 10 ml to 100 ml with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 247 nm, Appendix II B. Calculate the content of $C_{15}H_{13}FO_2$ taking 802 as the value of A(1%, 1 cm) at the maximum at 247 nm.

Fluticasone Cream

General Notices

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Cream contains Fluticasone Propionate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) transfer a quantity of the cream containing 1 mg of fluticasone propionate to a separating funnel, add 25 ml of *acetonitrile* and 25 ml of n-*hexane*, shake for 3 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug, previously washed with *acetonitrile*, into a 50 ml graduated flask, repeat the extraction with one 5 ml and one 2 ml quantities of *acetonitrile*, filter and add the extracts to the filtered layer; wash the absorbent cotton plug with 1 to 2 ml of *acetonitrile*, add the washings to the filtered layer and dilute the combined extracts to 50 ml with *acetonitrile*. Evaporate 4 ml of the resulting solution to dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.2 ml of *acetonitrile*. Solution (2) contains 0.04% w/v of *fluticasone propionate BPCRS* in *acetonitrile*. After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as that in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light. For solution (1) transfer a quantity of the cream containing 1 mg of fluticasone propionate to a separating funnel, add 25 ml of *ethanol (65%)*, stopper and shake until the cream is completely dispersed. Add 25 ml of n-*hexane*, shake for 3 minutes and allow to separate, filter the lower aqueous layer through an absorbent cotton plug, previously washed with *ethanol (65%)*, into a graduated flask and repeat the extraction with one 5 ml and then one 2 ml quantity of *ethanol (65%)*, filtering the aqueous ethanol extracts into the same graduated flask. Wash the absorbent cotton plug with *ethanol (65%)*, collecting the washings in the flask and dilute the combined extracts to 50 ml with *ethanol (65%)*. For solution (2) dilute 2 ml of a 0.05% w/v solution of *fluticasone propionate BPCRS* in *methanol (80%)* to 50 ml with *ethanol (65%)*. Solution (3) contains 0.002% w/v of *fluticasone propionate impurity standard BPCRS* in mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable) and maintained at a temperature of 50 ^{c}, (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol* and (c) a detection wavelength of 240 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.6. If necessary, adjust the proportion of acetonitrile in the mobile phase.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the cream using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

Fluticasone Nasal Drops

General Notices

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Nasal Drops is a suspension of Fluticasone Propionate in a suitable liquid in a container fitted with an appropriate nasal delivery system.

The nasal drops comply with the requirements stated under Nasal Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the nasal drops containing 2 mg of Fluticasone Propionate add sufficient *acetonitrile* to produce 5 ml, shake for 3 minutes and filter.

(2) 0.04% w/v of *fluticasone propionate BPCRS* in *acetonitrile.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 40 µl of each solution.

(d) Develop the plate to 12 cm

(e) After removal of the plate, allow it to dry in a current of air and examine *under ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the following operations in subdued light using low-actinic glassware. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nasal drops containing 1 mg of Fluticasone Propionate to 5 ml with a mixture of equal volumes of mobile phase A and mobile phase B and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

(3) 0.02% w/v of *fluticasone propionate BPCRS* and 0.00004% w/v of *fluticasone impurity D EPCRS* in a mixture of equal volumes of mobile phase A and mobile phase B.

(4) Dilute 1 volume of solution (3) to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B, dilute 5 volumes of this solution to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 50 µl of each solution.

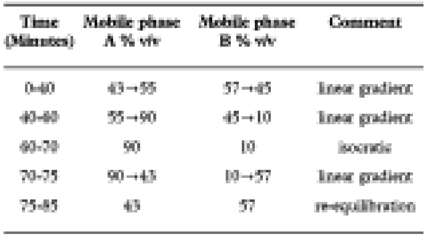
MOBILE PHASE

Mobile phase A A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *acetonitrile.*

Mobile phase B A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *water*.

Equilibrate the column with a mixture of 43 volumes of mobile phase A and 57 volumes of mobile phase B.

Use the following gradient.



Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-40	43→55	57→45	linear gradient
40-60	55→90	45→10	linear gradient
60-70	90	10	isocratic
70-75	90→43	10→57	linear gradient
75-85	43	57	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless (a) in the chromatogram obtained with solution (3), the *resolution* *factor* between fluticasone impurity D and fluticasone propionate is at least 1.5 and (b) in the chromatogram obtained with solution (4) the peak due to fluticasone propionate has a *signal to noise* ratio of at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (0.5%),

the sum of the areas of any such peaks is not greater than 4 times the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the following operations in subdued light using low-actinic glassware. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix the contents of 20 ampoules. Add 25 ml of *ethanol (65%)* to a quantity of the nasal drops containing 1 mg of Fluticasone Propionate, shake with the aid of ultrasound for 10 minutes. Add sufficient *ethanol (65%)* to produce 50 ml and filter.

(2) Dilute 2 ml of a 0.05% w/v solution of *fluticasone propionate BPCRS* in *methanol (80%)* to 50 ml with *ethanol (65%)*.

(3) 0.004% w/v of *fluticasone S-methyl impurity* BPCRS and 0.002% w/v of *fluticasone propionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5. If necessary, adjust the proportion of *acetonitrile* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the nasal drops using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

Fluticasone Nasal Spray

General Notices

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Nasal Spray is a suspension of Fluticasone Propionate in a suitable liquid in a container fitted with an appropriate nasal delivery system.

The nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *silica gel F_{254} precoated plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) transfer a quantity of the nasal spray containing 1 mg of Fluticasone Propionate to a separating funnel, add 25 ml of *acetonitrile* and 25 ml of n-*hexane*, shake for 3 minutes and allow to separate. Retain the lower layer, repeat the extraction with two 5 ml quantities of *acetonitrile*. Filter the combined extracts and add sufficient *acetonitrile* to produce 50 ml. Evaporate 20 ml of the resulting solution to dryness using a rotary evaporator at a temperature not exceeding 40° and dissolve the residue in 1 ml of *acetonitrile*. Solution (2) contains 0.04% w/v of *fluticasone propionate BPCRS* in acetonitrile. After removal of the plate, allow it to dry in a current of air and examine *under ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the following operations in subdued light using low-actinic glassware. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nasal spray containing 1 mg of Fluticasone Propionate to 5 ml with a mixture of equal volumes of mobile phase A and mobile phase B and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of mobile

phase A and mobile phase B.

(3) 0.02% w/v of fluticasone propionate BPCRS and 0.00004% w/v of fluticasone impurity D EPCRS in a mixture of equal volumes of mobile phase A and mobile phase B.

(4) Dilute 1 volume of solution (3) to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B, further dilute 5 volumes of this solution to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with octadecylsilyl silica gel for chromatography (5 µm) (Spherisorb ODS 1 is suitable).

(b) Gradient elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 240 nm.

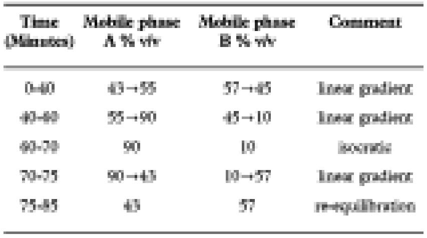
(f) Injection volume of 50 µl

MOBILE PHASE

Mobile phase A A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *acetonitrile.*

Mobile phase B A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *water*.

Equilibrate the column with a mixture of 43 volumes of mobile phase A and 57 volumes of mobile phase B. Carry out a gradient elution using the following gradient programme.



Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-40	43→55	57→45	linear gradient
40-60	55→90	45→10	linear gradient
60-70	90	10	isocratic
70-75	90→43	10→57	linear gradient
75-85	43	57	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless (a) in the chromatogram obtained with solution (3), the *resolution factor* between fluticasone impurity D and fluticasone propionate is at least 1.5 and (b) in the chromatogram obtained with solution (4) the peak due to fluticasone propionate has a *signal to noise* ratio of at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than 4 times the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.1 times the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the following operations in subdued light using low-actinic glassware. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After priming the pump, discharge the container a sufficient number of times to obtain 1 mg of Fluticasone Propionate, add 25 ml of ethanol (65%) and shake with the aid of ultrasound for 10 minutes. Add sufficient ethanol (65%) to produce 50 ml, filter and use the filtrate.

(2) Dilute 2 ml of a 0.05% w/v solution of fluticasone propionate BPCRS in methanol (80%) to 50 ml with ethanol (65%).

(3) 0.0004% w/v of fluticasone S-methyl impurity *BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with octadecylsilyl silica gel for chromatography (5 µm) (Spherisorb ODS 1 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 240 nm.

(f) Injection volume of 20 µl.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5. If necessary, adjust the proportion of acetonitrile in the mobile phase if necessary.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the nasal spray using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

LABELLING

The label states the amount of active ingredient delivered by each actuation of the valve and the number of deliveries available from the container.

Fluticasone Ointment

General Notices

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Ointment contains Fluticasone Propionate in a suitable basis.
The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) transfer a quantity of the ointment containing 0.1 mg of fluticasone propionate to a separating funnel, add 10 ml of *acetonitrile* and 50 ml of n-*hexane*, shake for 5 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug previously washed with *acetonitrile*, extract the hexane layer with two 5 ml quantities of *acetonitrile*, filter each extract through the absorbent cotton plug and wash the absorbent cotton plug with 2 ml of *acetonitrile*. Add the washings to the combined filtrates, evaporate the resulting solution to dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.5 ml of *acetonitrile*. Solution (2) contains 0.020% w/v of *fluticasone propionate BPCRS* in *acetonitrile*. After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm).* The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light. For solution (1) transfer a quantity of the ointment containing 0.1 mg of fluticasone propionate to a separating funnel, add 45 ml of n-*hexane*, previously heated to 60° in a water bath, stopper the funnel and shake until the ointment is dispersed, venting frequently. Wash the stopper and neck of the funnel with 5 ml of n-*hexane* collecting the washings in the funnel, allow the funnel to cool to room temperature, add 10 ml of *methanol (80%)*, stopper, shake for 1 minute and allow to separate. Filter the lower aqueous layer through an absorbent cotton plug, previously washed with *methanol (80%)*, into a graduated flask; repeat the extraction with two 5 ml quantities of *methanol (80%)*, filtering the aqueous methanol extracts into the same graduated flask. Wash the absorbent cotton plug with 2 ml of *methanol (80%)*, collecting the washings in the flask and dilute the extract to 25 ml with *methanol (80%)*. For solution (2) dilute 2 ml of a 0.005% w/v solution of *fluticasone propionate BPCRS* in *methanol (80%)* to 25 ml with the same solvent. Solution (3) contains 0.0004% w/v of *fluticasone* S-*methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in *methanol (80%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable) and maintained at a temperature of 50^{c}, (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol* and (c) a detection wavelength of 240 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.6. If necessary, adjust the proportion of acetonitrile in the mobile phase.

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the ointment using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

Fluvoxamine Tablets

General Notices

Action and use

Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION

Fluvoxamine Tablets contain Fluvoxamine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 10 ml of *acetonitrile* for 10 minutes, centrifuge and evaporate the supernatant liquid to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluvoxamine maleate *(RS 159)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel HF precoated plate (Analtech Uniplates are suitable) and a mixture of 5 volumes of 13.5M *ammonia* and 95 volumes of *ethanol (96%)* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 5 ml of *methanol* for 10 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 1.0% w/v of *fluvoxamine maleate BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm).* The two principal spots in the chromatogram obtained with solution (1) correspond to those in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *water* and rotate the paddle at 50 revolutions per minute. After 20 minutes, withdraw a sample of 10 ml of the medium and centrifuge. Measure the *absorbance* of the clear supernatant liquid, Appendix II B, suitably diluted with *water* if necessary, at 244 nm using *water* in the reference cell. Calculate the total content of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2$, $C_4H_4O_4$, in the medium taking 270 as the value of A (1%, 1 cm) at the maximum at 244 nm. The amount is not less than 70% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Fluvoxamine Maleate with 125 ml of the mobile phase for 10 minutes, add sufficient mobile phase to produce 250 ml, mix, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) heat a 0.32% w/v solution of *fluvoxamine maleate impurity standard BPCRS* in 0.1M *hydrochloric acid* on a water bath for 10 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable) and maintained at 35°, (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 40 volumes of a solution containing 1.25% w/v of *diammonium hydrogen orthophosphate* and 0.275% w/v of *sodium heptanesulphonate monohydrate* and 60 volumes of *methanol*, adjusting the pH of the mixture to 3.5 with *orthophosphoric acid* and (c) a detection wavelength of 254 nm.

When the chromatograms are recorded under the conditions described above, the retention time of fluvoxamine maleate is 7 to 9 minutes. If necessary, adjust the composition of the mobile phase (increasing the methanol content decreases the retention time, increasing the water content increases the retention time).

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *fluvoxamine maleate impurity standard BPCRS* and the *resolution factor* between the peaks corresponding to fluvoxamine and the *Z*-isomer is at least 1.0.

In the chromatogram obtained with solution (1) identify the impurities from the chromatogram obtained with solution (3) and from the reference chromatogram supplied with the reference material. The area of any peak corresponding to the 'addition product' is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%) and the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard the peak corresponding to maleic acid (which elutes immediately after the solvent front) and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Fluvoxamine Maleate with 125 ml of the mobile phase for 10 minutes, add sufficient of the mobile phase to produce 250 ml, mix, centrifuge and dilute 1 volume of the supernatant liquid to 10 volumes with the mobile phase. Solution (2) contains 0.010% w/v of *fluvoxamine maleate BPCRS* in the mobile phase.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in the tablets using the declared content of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in *fluvoxamine maleate BPCRS*.

STORAGE

Fluvoxamine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Fluvoxamine Maleate.

Folic Acid Tablets

General Notices

Action and use

Vitamin B component.

DEFINITION

Folic Acid Tablets contain Folic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of folic acid, $C_{19}H_{19}N_7O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 20 volumes of 13.5M *ammonia*, 20 volumes of *propan-1-ol* and 60 volumes of *ethanol (96%)* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 0.5 mg of folic acid with 1 ml of a mixture of 1 volume of 13.5M *ammonia* and 9 volumes of *methanol*, centrifuge and use the supernatant liquid. Solution (2) contains 0.05% w/v of *folic acid EPCRS* in a mixture of 2 volumes of 13.5M *ammonia* and 9 volumes of *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, fluorescence and size to that in the chromatogram obtained with solution (2).

TESTS

Hydrolysis products

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and protecting solutions (1) and (2) from light. Solution (1) is a solution in the mobile phase containing 0.5 µg of *4-aminobenzoic acid* and 2.0 µg of N-*(4-aminobenzoyl)*-L-*glutamic acid* per ml. For solution (2) shake a quantity of the powdered tablets containing 5.0 mg of folic acid with 50 ml of the mobile phase, centrifuge and use the supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) 0.05M *potassium dihydrogen orthophosphate*, adjusted to pH 5.5 with 5M *sodium hydroxide*, as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 269 nm.

In the chromatogram obtained with solution (1) two peaks, due to *N*-(4-aminobenzoyl)-L-glutamic acid and 4-aminobenzoic acid, are obtained in order of their emergence. The test is not valid unless the *resolution factor* between the two peaks is at least 3.

The areas of the peaks due to 4-aminobenzoic acid and *N*-(4-aminobenzoyl)-L-glutamic acid in the chromatogram obtained with solution (1) are greater than the areas of any corresponding peaks in the chromatogram obtained with solution (2).

Uniformity of content

Tablets containing less than 2 mg of folic acid comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 1 ml of 0.5M *hydrochloric acid* to 5 ml of a 0.0020% w/v solution of *folic acid EPCRS* in 0.1M *sodium hydroxide* and dilute to 10 ml with the mobile phase. For solution (2) shake one tablet with 5 ml of 0.1M *sodium hydroxide*, add sufficient mobile phase to produce a solution containing 0.001% w/v of folic acid, centrifuge and use the supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 93 volumes of 0.05M *potassium dihydrogen orthophosphate* and 7 volumes of *acetonitrile* adjusted to pH 6.0 with 5M *sodium hydroxide* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 283 nm.

Calculate the content of $C_{19}H_{19}N_7O_6$ in each tablet using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid EPCRS*.

ASSAY

For tablets containing 2 mg or more of folic acid

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light. For solution (1) dilute 5 ml of a 0.020% w/v solution of *folic acid EPCRS* in 0.1M *sodium hydroxide* to 100 ml with the mobile phase. For solution (2) shake a quantity of the powdered tablets containing 20 mg of folic acid with 50 ml of 0.1M *sodium hydroxide*, dilute to 100 ml with the same solvent, centrifuge and dilute 5 ml of the supernatant liquid to 100 ml with the mobile phase.

The chromatographic procedure described under Uniformity of content may be used.

Calculate the content of $C_{19}H_{19}N_7O_6$ in the tablets using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid EPCRS*.

For tablets containing less than 2 mg of folic acid

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Folic Acid Tablets should be protected from light.

Foscarnet Intravenous Infusion

General Notices

Action and use

Antiviral (cytomegalovirus).

DEFINITION

Foscarnet Intravenous Infusion is a sterile solution of Foscarnet Sodium in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of foscarnet sodium, $CNa_3O_5P,6H_2O$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. Dry a quantity containing 48 mg of foscarnet sodium over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 16 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of foscarnet sodium *(RS 160)*. Disregard any peak occurring at 902 cm^{-1} or any shoulder at 1179 cm^{-1}.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH, 7.2 to 7.6, Appendix V L.

Phosphate and phosphite

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a solution containing 0.04% w/v of *sodium dihydrogen orthophosphate monohydrate* and 0.06% w/v of *sodium phosphite* (solution A). For solution (1) add 6 ml of solution A to 60 mg of *foscarnet sodium BPCRS* and dilute to 25 ml with *water*. For solution (2) dilute a volume of the intravenous infusion with sufficient *water* to produce a solution containing 0.24% w/v of foscarnet sodium.

The chromatographic procedure may be carried out using (a) a stainless steel column (5 cm × 4.6 mm) packed with an anion exchange resin (Waters IC PAK is suitable) at a temperature of 25°, (b) as the mobile phase with a flow rate of 1.4 ml per minute a solution prepared by dissolving 0.204 g of *potassium hydrogen phthalate* in *water*, adding 5 ml of 1M *nitric acid VS* and sufficient *water* to produce 2000 ml and (c) a detection wavelength of 290 nm. Inject 20 µl of each solution.

Allow the column to stabilise by passing mobile phase through it for at least 2 hours before starting the chromatography. The test is not valid unless, in the chromatogram obtained with solution (1), the peak due to phosphate (which elutes first) shows baseline separation from the peak due to phosphite.

In the chromatogram obtained with solution (2) the area of any peak corresponding to phosphate is not greater than 0.7 times the area of the corresponding peak in the chromatogram obtained with solution (1) and the area of any peak corresponding to phosphite is not greater than half the area of the corresponding peak in the chromatogram obtained with solution (1) (2.0% of phosphate and 1.0% of phosphite).

Related esters

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. Solutions (1) and (2) are solutions of the intravenous infusion diluted to contain (1) 1.0% w/v and (2) 0.0020% w/v respectively of foscarnet sodium. Solution (3) contains 0.02% w/v of *foscarnet sodium BPCRS* and 0.02% w/v of *foscarnet impurity B EPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Microsphere C18 is suitable), (b) as the mobile phase at a flow rate of 1 ml per minute a solution prepared as described below and (c) a detection wavelength of 230 nm. Prepare two solutions containing (A) 100 ml of 0.5M *acetic acid*, 6 ml of 0.1M *sodium pyrophosphate* and 3.22 g of *sodium sulphate* in sufficient *water* to produce 1000 ml and (B) 6.8 g of *sodium acetate*, 6 ml of 0.1M *sodium pyrophosphate* and 3.22 g of *sodium sulphate* in sufficient *water* to produce 1000 ml. Mix solution A and solution B to produce a solution of pH 4.4 and to 1000 ml of this solution add 0.25 g of *tetrahexylammonium hydrogen sulphate* and 100 ml of *methanol*. Inject 5 µl of each solution.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to foscarnet sodium and foscarnet impurity B (disodium (ethoxyoxydophosphanyl)formate) is at least 7.

For solution (1) allow the chromatography to proceed for at least 2.5 times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Bacterial endotoxins

The endotoxin limit concentration is 2 IU per ml, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase containing (1) a solution of the intravenous infusion diluted to contain 0.10% w/v of foscarnet sodium and (2) 0.10% w/v of *foscarnet sodium BPCRS*.

The chromatographic procedure described under Related esters may be used injecting 5 µl of each solution.

Calculate the content of $CNa_3O_5P,6H_2O$ in the intravenous infusion using the declared content of $CNa_3O_5P,6H_2O$ in *foscarnet sodium BPCRS*.

STORAGE

Foscarnet Intravenous Infusion should be stored at a temperature not exceeding 30°. It should not be refrigerated.

LABELLING

The label states that Foscarnet Intravenous Infusion may be administered as supplied via a central venous line or via a peripheral vein after dilution with Glucose Intravenous Infusion (50 g per litre) or Sodium Chloride Intravenous Infusion (0.9% w/v).

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Foscarnet Sodium with the exception of disodium ethoxycarbonyl phosphonate and sodium ethyl phosphonate.

Fosfestrol Injection

General Notices

Action and use

Estrogen.

DEFINITION

Fosfestrol Injection is a sterile solution of Fosfestrol Sodium in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (4).

B. The *light absorption*, Appendix II B, in the range 200 to 350 nm of the final solution obtained in the Assay exhibits a maximum at 240 nm.

TESTS

Alkalinity

pH, 7.7 to 8.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 15 volumes of each of *pentan-1-ol*, *triethylamine* and *water* and 55 volumes of *propan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute a volume of the injection containing the equivalent of 12 mg of anhydrous fosfestrol sodium to 5 ml with *methanol (50%)*. For solution (2) dilute 3 volumes of solution (1) to 200 volumes with *methanol (50%)*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*. Solution (4) contains 0.24% w/v of *fosfestrol sodium BPCRS* in *methanol (50%)*. Solution (5) contains 0.007% w/v of *diethylstilbestrol monophosphate BPCRS* (equivalent to 0.0079% w/v of disodium diethylstilbestrol monophosphate) in *methanol (50%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot in the chromatogram obtained with solution (1) corresponding to diethylstilbestrol monophosphate is not more intense than the spot in the chromatogram obtained with solution (5) (3.3%); any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Free diethylstilbestrol

Dilute a volume of the injection containing the equivalent of 0.6 g of anhydrous fosfestrol sodium with 20 ml of *water*, adjust the pH if necessary to between 7.9 and 8.2 with 0.1M *sodium hydroxide* and extract with two 30 ml quantities of *dichloromethane* and retain the aqueous phase. Wash the combined dichloromethane extracts with 30 ml of *water* and allow to separate. Extract the aqueous wash with 10 ml of *dichloromethane*, filter the dichloromethane extract, add to the original extract and add the aqueous extract to the original aqueous phase. Reserve the aqueous phase for the test for diethylstilbestrol disodium monophosphate. Evaporate the combined filtrates to dryness on a water bath and dissolve the residue in 5 ml of *absolute ethanol*. To the resulting solution add 5 ml of 0.01M *dipotassium hydrogen orthophosphate*. Transfer a portion of the mixture to a 1-cm closed silica cell, place the cell 10 cm from an 8-watt, short-wave ultraviolet lamp and irradiate for 60 minutes protected from daylight. The *absorbance* of the irradiated solution, measured within 1 hour after preparation of the solutions, at the maximum at 418 nm, Appendix II B, using *water* in the reference cell is not greater than that obtained by repeating the operation using a reference solution prepared in the following manner. To 20 ml of a 0.04% w/v solution of *diethylstilbestrol EPCRS* in *absolute ethanol* add 20 ml of 0.01M *dipotassium hydrogen orthophosphate* and mix (0.33%).

Diethylstilbestrol disodium monophosphate

Dilute the combined aqueous phase reserved in the test for Free diethylstilbestrol to 100 ml with *water* (solution A). Prepare a solution containing 0.0135% w/v of *diethylstilbestrol EPCRS* in *ethanol (96%)* (solution B). To 5 ml of each solution add 3 ml of *phosphomolybdotungstic reagent* and 2 ml of *ethanol (96%)*, dilute to 50 ml with a 5% w/v solution of *anhydrous sodium carbonate*, mix thoroughly and allow to stand for 30 minutes; filter the solutions through a polytetrafluoroethylene filter (0.45 µm) and measure the *absorbance*, Appendix II B, at 660 nm using *water* in the reference cell. The *absorbance* of solution A, multiplied by 1.46, is not greater than that obtained for solution B (3.3%).

ASSAY

Dilute a volume of the injection containing the equivalent of 60 mg of anhydrous fosfestrol sodium to 250 ml with a pH 7.9 buffer solution containing 1.134% w/v of *disodium hydrogen orthophosphate* and 0.04083% w/v of *potassium dihydrogen orthophosphate* and dilute 5 ml of the resulting solution to 100 ml with the same buffer solution. Measure the *absorbance* of the resulting solution at 240 nm, Appendix II B, and calculate the content of $C_{18}H_{18}Na_4O_8P_2$ taking 310 as the value of *A* (1%, 1 cm) at the maximum at 240 nm.

STORAGE

Fosfestrol Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fosfestrol sodium.

IMPURITIES

The impurities limited by the requirements of the monograph include:

A. diethylstilbestrol disodium monophosphate

B. diethylstilbestrol.

Fosfestrol Tablets

General Notices

Action and use

Estrogen.

DEFINITION

Fosfestrol Tablets contain Fosfestrol Sodium. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (4).

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, in the range 200 to 350 nm, exhibits a maximum at 240 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of *water* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain the equivalent of 0.0024% w/v of anhydrous fosfestrol sodium. Measure the *absorbance* of this solution, Appendix II B, at 240 nm using dissolution medium in the reference cell. Calculate the total content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$, in the medium taking 313 as the value of *A* (1%, 1 cm) at 240 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 15 volumes each of *pentan-1-ol*, *triethylamine* and *water* and 55 volumes of *propan-1-ol* as the mobile phase, but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute a quantity of the powdered tablets containing the equivalent of 12 mg of anhydrous fosfestrol sodium to 5 ml with *methanol (50%)*. For solution (2) dilute 3 volumes of solution (1) to 200 volumes with *methanol (50%)*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*. Solution (4) contains 0.24% w/v of *fosfestrol sodium BPCRS* in *methanol (50%)*. Solution (5) contains 0.007% w/v of *diethylstilbestrol monophosphate BPCRS* (equivalent to

0.0079% w/v of disodium diethylstilbestrol monophosphate) in *methanol (50%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot in the chromatogram obtained with solution (1) corresponding to diethylstilbestrol monophosphate is not more intense than the spot in the chromatogram obtained with solution (5) (3.3%). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Free diethylstilbestrol

Suspend a quantity of the powdered tablets containing the equivalent of 0.24 g of anhydrous fosfestrol sodium in 30 ml of *water*, add 10 ml of *ethanol (96%)*, dilute to 50 ml with *water*, stir for 45 minutes and centrifuge at 10,000 revolutions per minute. Extract 25 ml of the supernatant liquid with two 20 ml quantities of *dichloromethane* and reserve the aqueous phase for the test for Diethylstilbestrol disodium monophosphate. Wash the combined dichloromethane extracts with 30 ml of *water* and drain into a 100 ml round-bottomed flask. Extract the aqueous wash with 10 ml of *dichloromethane*, filter the dichloromethane extract and add to the original extract. Evaporate the combined filtrates to dryness using a rotary evaporator and dissolve the residue in 5 ml of *absolute ethanol*. To the resulting solution add 5 ml of 0.01M *dipotassium hydrogen orthophosphate*. Transfer a portion of the mixture to a 1-cm closed silica cell, place the cell 10 cm from an 8-watt, short-wave ultraviolet lamp and irradiate for 60 minutes protected from daylight. The *absorbance* of the irradiated solution, measured within 1 hour after preparation of the solutions, at the maximum at 418 nm, Appendix II B, using *water* in the reference cell is not greater than that obtained by repeating the operation using a reference solution prepared in the following manner. To 20 ml of a 0.008% w/v solution of *diethylstilbestrol EPCRS* in *absolute ethanol* add 20 ml of 0.01M *dipotassium hydrogen orthophosphate* and mix (0.33%).

Diethylstilbestrol disodium monophosphate

Dilute the aqueous phase reserved in the test for Free diethylstilbestrol to 50 ml with *water* (solution A). Prepare a solution containing 0.005% w/v of *diethylstilbestrol EPCRS* in *ethanol (96%)* (solution B). To 5 ml of each solution add 3 ml of *phosphomolybdotungstic reagent* and 2 ml of *ethanol (96%)*, dilute to 50 ml with a 5% w/v solution of *anhydrous sodium carbonate*, mix thoroughly and allow to stand for 30 minutes; filter the solutions through a polytetrafluoroethylene filter (0.45 µm) and measure the *absorbance*, Appendix II B, at 660 nm using *water* in the reference cell. The *absorbance* of solution A, multiplied by 1.46, is not greater than that obtained for solution B (3.3%).

ASSAY

Weigh and powder 20 tablets. Dilute a quantity of the powdered tablets containing the equivalent of 0.1 g of anhydrous fosfestrol sodium to 250 ml with *water*, stir the suspension for 1 hour, filter, discard the first 50 ml of filtrate and dilute 5 ml of the resulting solution to 100 ml with a pH 7.9 buffer solution containing 1.134% w/v of *disodium hydrogen orthophosphate* and 0.04083% w/v of *potassium dihydrogen orthophosphate*. Measure the *absorbance* of the resulting solution at 240 nm, Appendix II B, and calculate the content of $C_{18}H_{18}Na_4O_8P_2$ taking 310 as the value of A(1%, 1 cm) at the maximum at 240 nm.

STORAGE

Fosfestrol Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fosfestrol sodium.

IMPURITIES

The impurities limited by the requirements of the monograph include:

A. diethylstilbestrol disodium monophosphate

B. diethylstilbestrol.

Fructose Intravenous Infusion

General Notices

DEFINITION

Fructose Intravenous Infusion is a sterile solution of Fructose in Water for Injections.
The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fructose, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or pale yellow solution.

IDENTIFICATION

A. Heat with *cupri-tartaric solution R1*. A copious red precipitate is produced.

B. The solution prepared in the Assay is laevorotatory.

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L, when determined on a solution diluted if necessary with *water for injections* to contain 5% w/v of Fructose and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

5-Hydroxymethylfurfural and related substances

Dilute a volume containing 1.0 g of Fructose to 500 ml with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.50, Appendix II B.

Pyrogens

Complies with the *test for pyrogens*, Appendix XIV D. Use per kg of the rabbit's weight a volume containing 0.5 g of Fructose.

ASSAY

To a volume containing 5 g of Fructose add 0.2 ml of 5M *ammonia* and sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.5427 represents the weight in g of fructose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING

The strength is stated as the number of grams of Fructose per litre.

Furosemide Injection

General Notices

Action and use

Loop diuretic.

DEFINITION

Furosemide Injection is a sterile solution of furosemide sodium, prepared by the interaction of Furosemide with Sodium Hydroxide, in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of furosemide, $C_{12}H_{11}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 320 nm of the final solution obtained in the Assay exhibits two maxima, at 228 nm and 271 nm.

B. In the test for Related substances, the chromatogram obtained with solution (2) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (3).

TESTS

Alkalinity

pH, 8.0 to 9.3, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) dilute a quantity of the injection with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Furosemide. For solution (2) dilute 1 volume of solution (1) to 400 volumes with the mobile phase. Solution (3) contains 0.00025% w/v of *furosemide BPCRS* in the mobile phase. Solution (4) contains 0.00025% w/v of each of *furosemide BPCRS* and *furosemide impurity A EPCRS* in the mobile phase. Solution (5) contains 0.001% w/v of *4-chloro-5-sulphamoylanthranilic acid BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (ChromSpher C8 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture prepared in the following manner: dissolve 0.2 g of *potassium dihydrogen orthophosphate* and 0.25 g of *cetrimide* in 70 ml of *water*, adjust the pH to 7.0 with 6M *ammonia* and add 30 ml of *propan-1-ol*, and (c) a detection wavelength of 238 nm.

Inject 100 µl of solution (4). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are not less than 20% of the full-scale of the recorder. The test is not valid unless the *resolution factor* between the first peak (furosemide impurity A) and the second peak (furosemide) is at least 4.

Inject 100 µl of solution (1) and allow the chromatography to proceed for three times the retention time of the principal peak. The area of any peak corresponding to 4-chloro-5-sulphamoylanthranilic acid is not greater than the area of the peak in the chromatogram obtained with solution (5) (1%) and the sum of the areas of any other *secondary peaks* is not greater than twice the area of the first peak in the chromatogram obtained with solution (4) (0.5%). Disregard any peak with an area less than 0.1 times the area of the first peak in the chromatogram obtained with solution (4) (0.025%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection with *water BET*, if necessary, to contain the equivalent of 10 mg of Furosemide per ml (solution A). The endotoxin limit concentration of this solution is 35 IU of endotoxin per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

To a volume containing the equivalent of 20 mg of Furosemide add sufficient *water* to produce 100 ml. Dilute 5 ml to 100 ml with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the value of A(1%, 1 cm) at the maximum at 271 nm.

STORAGE

Furosemide Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of Furosemide in a suitable dose-volume.

Furosemide Tablets

General Notices

Action and use

Loop diuretic.

DEFINITION

Furosemide Tablets contain Furosemide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of furosemide, $C_{12}H_{11}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 320 nm of the final solution obtained in the Assay exhibits two maxima, at 228 nm and 271 nm.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (3).

TESTS

Dissolution

Tablets containing less than 100 mg of Furosemide comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *phosphate buffer pH 5.8* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.001% w/v of Furosemide. Measure the *absorbance* of this solution, Appendix II B, at 277 nm using dissolution medium in the reference cell. Calculate the total content of furosemide, $C_{12}H_{11}ClN_2O_5S$, in the medium from the *absorbance* obtained from a 0.001% w/v solution of *furosemide BPCRS* in the dissolution medium and using the declared content of $C_{12}H_{11}ClN_2O_5S$ in *furosemide BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) dissolve a quantity of the powdered tablets containing 20 mg of Furosemide in sufficient of the mobile phase to produce 50 ml and mix with the aid of ultrasound for 15 minutes. For solution (2) dilute 1 volume of solution (1) to 500 volumes with the mobile phase. Solution (3) contains 0.00008% w/v of *furosemide BPCRS* in the mobile phase. Solution (4) contains 0.00008% w/v of each of *furosemide BPCRS* and *furosemide impurity A EPCRS* in the mobile phase.

Solution (5) contains 0.00032% w/v of *4-chloro-5-sulphamoylanthranilic acid BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (ChromSpher C8 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture prepared in the following manner: dissolve 0.2 g of *potassium dihydrogen orthophosphate* and 0.25 g of *cetrimide* in 70 ml of *water*, adjust the pH to 7.0 with 6M *ammonia* and add 30 ml of *propan-1-ol* and (c) a detection wavelength of 238 nm.

Inject 100 µl of solution (4). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are not less than 20% of the full-scale of the recorder. The test is not valid unless the *resolution factor* between the first peak (furosemide impurity A) and the second peak (furosemide) is at least 4.

Inject 100 µl of solution (1) and allow the chromatography to proceed for three times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-chloro-5-sulphamoylanthranilic acid is not greater than the area of the peak in the chromatogram obtained with solution (5) (0.8%) and the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the area of the first peak in the chromatogram obtained with solution (4) (0.5%). Disregard any peak with an area less than 0.1 times the area of the first peak in the chromatogram obtained with solution (4) (0.02%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.2 g of Furosemide with 300 ml of 0.1M *sodium hydroxide* for 10 minutes, add sufficient 0.1M *sodium hydroxide* to produce 500 ml and filter. Dilute 5 ml to 250 ml with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the value of A(1%, 1 cm) at the maximum at 271 nm.

Fusidic Acid Cream

General Notices

Action and use

Antibacterial.

DEFINITION

Fusidic Acid Cream contains Fusidic Acid in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 12.5 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) disperse, with shaking, a quantity of the cream containing the equivalent of 40 mg of anhydrous fusidic acid in 10 ml of *ethanol (96%)*, filter and use the filtrate. Solution (2) contains 0.5% w/v of *diethanolamine fusidate BPCRS* in *ethanol (96%).* Solution (3) contains 0.05% w/v of *potassium sorbate* in *water*. After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm).* The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2) and is well separated from any spot corresponding to the spot in the chromatogram obtained with solution (3).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (2) .

TESTS

Acidity

pH, 4.5 to 6.0, determined directly on the cream, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the cream containing the equivalent of 15 mg of anhydrous fusidic acid in 25 ml of the mobile phase, heat the mixture until the cream has melted and shake vigorously for 15 minutes. Cool the mixture to below 10°, filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few ml of filtrate, and allow to warm to room temperature. For solution (2) mix 1 volume of a 0.06% w/v solution of *3-ketofusidic acid EPCRS* in the mobile phase with 1 volume of solution (1) and dilute to 100 volumes with the mobile phase. For solution (3) dilute 30 µl of solution (1) to 100 ml with the mobile phase. Solution (4) contains 0.004% w/v of *potassium sorbate* in the mobile phase.

The chromatographic conditions described under Assay may be used. For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

The test is not valid unless (a) the *resolution factor* between the peaks corresponding to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with solution (2) is at least 3.5 and (b) the principal peak in the chromatogram obtained with solution (3) has a *signal-to-noise ratio* of at least 3. If necessary, adjust the composition of the mobile phase.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than five times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (5%). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.03%) and any peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (4).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the cream containing the equivalent of 15 mg of anhydrous fusidic acid in 50 ml of the mobile phase, heat until the cream has melted and shake vigorously for 15 minutes. Cool the mixture to below 10°, filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few ml of filtrate and allow to warm to room temperature. Solution (2) contains 0.0375% w/v of *diethanolamine fusidate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable), (b) a mixture of 10 volumes of *methanol*, 40 volumes of 0.05M *orthophosphoric acid* and 50 volumes of *acetonitrile* as the mobile phase with a flow rate of 2.5 ml per minute and (c) a detection wavelength of 235 nm.

The assay is not valid unless the *column efficiency*, determined on the peak due to fusidic acid in the chromatogram obtained with solution (2), is at least 2000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is 2.0 or less.

Calculate the content of $C_{31}H_{48}O_6$ in the cream using the declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

Fusidic Acid Eye Drops

General Notices

Action and use

Antibacterial.

DEFINITION

Fusidic Acid Eye Drops are a sterile solution of Fusidic Acid in Purified Water.
The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 12.5 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) disperse, with shaking, a quantity of the eye drops containing the equivalent of 20 mg of anhydrous fusidic acid in 10 ml of *ethanol (70%)*, filter and use the filtrate. Solution (2) contains 0.25% w/v of *diethanolamine fusidate BPCRS* in *ethanol (70%).* After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm).* The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 5.2 to 6.2, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the eye drops with a mixture of 10 volumes of *methanol*, 30 volumes of 1% w/v *glacial acetic acid* and 60 volumes of *acetonitrile* to contain the equivalent of 0.075% w/v of anhydrous fusidic acid. Shake vigorously for 15 minutes, add 0.5 g of *potassium nitrate* and shake for a further minute. Filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few ml of filtrate, and dilute 10 volumes of the filtrate to 12.5 volumes with 0.05M *orthophosphoric acid*. For solution (2) mix 1 volume of a 0.06% w/v solution of *3-ketofusidic acid EPCRS* in the mobile phase with 1 volume of solution (1) and dilute to 100 volumes with the mobile phase. For solution (3) dilute 30 µl of solution (1) to 100 ml with the mobile phase.

The chromatographic conditions described under Assay may be used. For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

The test is not valid unless (a) the *resolution factor* between the peaks corresponding to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with solution (2) is at least 3.5 and (b) the principal peak in the chromatogram obtained with solution (3) has a *signal-to-noise ratio* of at least 3. If necessary, adjust the composition of the mobile phase.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than four times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (4%). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.03%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the eye drops with a mixture of 10 volumes of *methanol*, 30 volumes of 1% w/v *glacial acetic acid* and 60 volumes of *acetonitrile* (solution A) to contain the equivalent of 0.075% w/v of anhydrous fusidic acid. Shake vigorously for 15 minutes, add 0.5 g of *potassium nitrate* and shake for a further minute. Filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few ml of filtrate, and dilute 10 volumes of the filtrate to 12.5 volumes with 0.05M *orthophosphoric acid*. Solution (2) contains 0.075% w/v of *diethanolamine fusidate BPCRS* in a mixture of 40 volumes of solution A and 10 volumes of 0.05M *orthophosphoric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable), (b) a mixture of 10 volumes of *methanol*, 40 volumes of 0.05M *orthophosphoric acid* and 50 volumes of *acetonitrile* as the mobile phase with a flow rate of 2.5 ml per minute and (c) a detection wavelength of 235 nm.

The assay is not valid unless the *column efficiency*, determined on the peak due to fusidic acid in the chromatogram obtained with solution (2), is at least 2000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is 2.0 or less.

Calculate the content of $C_{31}H_{48}O_6$ in the eye drops using the declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

Fusidic Acid Oral Suspension

General Notices

Action and use

Antibacterial.

DEFINITION

Fusidic Acid Oral Suspension is a suspension of Fusidic Acid in powder of suitable fineness in a suitable flavoured vehicle.

Fusidic Acid Oral Suspension should not be diluted.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity containing the equivalent of 0.1 g of anhydrous fusidic acid add 5 ml of *water* and extract with three 10 ml quantities of *chloroform*. Wash the combined extracts with two 10 ml quantities of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 1 ml of *chloroform IR*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of fusidic acid *(RS 166)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 4.8 to 5.2, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following three solutions. For solution (1) extract a quantity of the oral suspension containing the equivalent of 0.10 g of anhydrous fusidic acid with two 20 ml quantities of *chloroform,* evaporate the combined extracts to dryness and dissolve the residue in 20 ml of the mobile phase. For solution (2) mix 1 ml of a 0.10% w/v solution of *3-ketofusidic acid EPCRS* in the mobile phase with 0.2 ml of solution (1) and dilute to 20 ml with the mobile phase. For solution (3) dilute 20 µl of solution (1) to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 to 15 cm × 4 to 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP18 is suitable), (b) a mixture of 10 volumes of *methanol*, 20 volumes of a 1% w/v solution of *orthophosphoric acid*, 20 volumes of *water* and 50 volumes of *acetonitrile* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 235 nm.

Inject separately 20 µl of each solution. Continue the chromatography for at least 3.5 times the retention time of the principal peak. The test is not valid unless the *resolution factor* between the peaks corresponding to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with solution (2) is at least 2.5 and unless the principal peak in the chromatogram obtained with solution (3) has a *signal-to-noise ratio* of at least 3.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than three times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.02%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.07% w/v of *diethanolamine fusidate BPCRS* in the mobile phase. For solution (2) shake thoroughly a weighed quantity of the oral suspension containing the equivalent of 30 mg of anhydrous fusidic acid with 25 ml of the mobile phase, dilute to 50 ml with the mobile phase, filter and use the clear filtrate.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrosorb RP-18 is suitable), (b) a mixture of 60 volumes of *acetonitrile*, 30 volumes of a 1% v/v solution of *glacial acetic acid* and 10 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 235 nm.

The *column efficiency*, determined using the principal peak in the chromatogram obtained with solution (1), should be at least 14,000 theoretical plates per metre.

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{31}H_{48}O_6$, weight in volume, using the equivalent declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

STORAGE

Fusidic Acid Oral Suspension should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

When Fusidic Acid Oral Suspension is prescribed or demanded, no strength being stated, an Oral Suspension containing the equivalent of 250 mg of anhydrous fusidic acid in 5 ml shall be dispensed or supplied.

Paediatric Ferrous Sulphate Oral Solution

General Notices

DEFINITION

Paediatric Ferrous Sulphate Oral Solution is a solution containing 1.2% w/v of Ferrous Sulphate Heptahydrate and a suitable antioxidant in a suitable vehicle with an orange flavour. It is intended to be diluted well with water before use.

Extemporaneous preparation

The following formula and directions apply.

Ferrous Sulphate Heptahydrate	12 g
Ascorbic Acid	2 g
Orange Syrup	100 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

Dissolve the Ascorbic Acid in the Double-strength Chloroform Water and use this solution to dissolve the Ferrous Sulphate Heptahydrate. Add the Orange Syrup and sufficient Water to produce 1000 ml and mix. The oral solution should be recently prepared.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ferrous sulphate heptahydrate, $FeSO_4,7H_2O$

1.10 to 1.30% w/v.

ASSAY

To 20 ml add 45 ml of *water*, 0.2 ml of *hydrochloric acid* and *dilute potassium permanganate solution* drop wise until a permanent pink colour is produced. Add 10 ml of *hydrochloric acid* and 3 ml of a 10% w/v solution of *ammonium thiocyanate* and titrate with 0.1M *titanium(III) chloride VS* maintaining a steady flow of *carbon dioxide* through the flask. Each ml of 0.1M *titanium(III) chloride VS* is equivalent to 27.80 mg of $FeSO_4,7H_2O$.

LABELLING

The label states that the oral solution should be diluted well with water before use.

Paediatric Ferrous Sulphate Oral Solution contains in 5 ml about 12 mg of ferrous iron.

Prolonged-release Felodipine Tablets

General Notices

Prolonged-release Felodipine Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Calcium channel blocker.

DEFINITION

Prolonged-release Felodipine Tablets contain Felodipine. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Felodipine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of felodipine, $C_{18}H_{19}Cl_2NO_4$

92.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 15 mg of Felodipine with 100 ml of *ethanol (96%),* filter, and dilute 5 ml of the filtrate to 50 ml with *ethanol (96%).* The *light absorption,* Appendix II B, in the range 250 to 450 nm exhibits a maximum at 362 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Felodipine with 10 ml of *methanol* and filter through a 0.45-µm filter.

(2) 0.1% w/v of *felodipine BPCRS* in *methanol*.

(3) 0.1% w/v each of *felodipine BPCRS* and *nifedipine BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* F_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop to 15 cm.

(e) Dry the plate in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots of different colours.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

C. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2) .

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

SOLVENT A

A mixture of 0.08% w/v of *orthophosphoric acid R* and 0.8% w/v of *sodium dihydrogen orthophosphate.*

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 10 mg of Felodipine with 10 ml of *methanol* and 20 ml of *acetonitrile* for 5 minutes, add 15 ml of solvent A and continue to disperse with the aid of ultrasound for a further 30 minutes. Cool, dilute to 50 ml with solvent A and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

(4) 0.006% w/v of *felodipine impurity standard BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Nova-Pak is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1.0 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

20 volumes of *methanol*, 40 volumes of *acetonitrile* and 40 volumes of solvent A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least than 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to Impurity A is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (4.0%);

the sum of the areas of the peaks corresponding to impurity B (relative retention about 0.7 with respect to felodipine and impurity C (relative retention about 1.4 with respect to felodipine) is not greater than the area of the principal peak in the chromatogram obtained with solution (2);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

SOLVENT A

A mixture of 0.08% w/v of *orthophosphoric acid R* and 0.8% w/v of *sodium dihydrogen orthophosphate.*

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 10 mg of Felodipine with 10 ml of methanol and 20 ml of acetonitrile for 5 minutes, add 15 ml of solvent A and mix with the aid of ultrasound for a further 30 minutes. Cool, add sufficient solvent A to produce 50 ml and filter through a 0.45-µm PTFE filter. Dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(2) 0.002% w/v of felodipine BPCRS in mobile phase.

(3) 0.006% w/v of felodipine impurity standard BPCRS in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{19}Cl_2NO_4$ in the tablets using the declared content of $C_{18}H_{19}Cl_2NO_4$ in *felodipine BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those impurities listed under Felodipine.

Prolonged-release Ferrous Sulphate Tablets

General Notices

Prolonged-release Ferrous Sulphate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Ferrous Sulphate Tablets contain Dried Ferrous Sulphate. They are formulated so that the medicament is released over a period of several hours. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of ferrous sulphate. The dissolution profile should reflect the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ferrous iron, Fe(II)

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The powdered tablets yield reaction A characteristic of *iron salts*, Appendix VI.

B. Extract a quantity of the powdered tablets containing 0.15 g of Dried Ferrous Sulphate with 10 ml of 2M *hydrochloric acid* and filter. The filtrate yields reaction A characteristic of *sulphates*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Dried Ferrous Sulphate as completely as possible in a mixture of 30 ml of *water* and 20 ml of 1M *sulphuric acid* and titrate with 0.1M *ammonium cerium(IV) sulphate VS* using *ferroin solution* as indicator. Each ml of 0.1M *ammonium cerium(IV) sulphate VS* is equivalent to 5.585 mg of Fe(II).

LABELLING

The quantity of active ingredient is stated both as the amount of dried ferrous sulphate and in terms of the equivalent amount of Fe(II).

Acid Gentian Mixture

General Notices

Acid Gentian Oral Solution

DEFINITION

Acid Gentian Mixture is an *oral solution* containing 10% v/v of Concentrated Compound Gentian Infusion and 5% v/v of Dilute Hydrochloric Acid in a suitable vehicle.

Extemporaneous preparation

It is recently prepared according to the following formula.

Concentrated Compound Gentian Infusion	100 ml
Dilute Hydrochloric Acid	50 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of hydrochloric acid, HCl

0.48 to 0.56% w/v.

ASSAY

To 10 ml add 10 ml of *water*, adjust the pH to between 5.0 and 6.0 with 2M *sodium hydroxide* and dilute to 25 ml with *water*. Add 75 ml of *acetate buffer pH 5.0* and titrate with 0.1M *silver nitrate VS* determining the end point potentiometrically using a silver indicator electrode and a glass reference electrode and stirring throughout the titration. Each ml of 0.1M *silver nitrate VS* is equivalent to 3.646 mg of HCl.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Alkaline Gentian Mixture

General Notices

Alkaline Gentian Oral Solution

DEFINITION

Alkaline Gentian Mixture is an *oral solution* containing 10% v/v of Concentrated Compound Gentian Infusion and 5% w/v of Sodium Bicarbonate in a suitable vehicle.

Extemporaneous preparation

It is recently prepared according to the following formula.

Concentrated Compound Gentian Infusion	100 ml
Sodium Bicarbonate	50 g
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$

4.75 to 5.25% w/v.

ASSAY

To 10 ml of the mixture add 100 ml of *water* and 25 ml of 0.5M *hydrochloric acid VS*, boil for 10 minutes and titrate the excess of hydrochloric acid with 0.5M *sodium hydroxide VS* using 0.5 ml of *methyl red solution* as indicator. Each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution

General Notices

St Marks Solution

NOTE: There are currently no licensed formulations in the United Kingdom.

Action and use

Prevention and treatment of dehydration.

DEFINITION

Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution contains Anhydrous Glucose, Sodium Chloride and Sodium Citrate. It is prepared by dissolving the dry ingredients in the specified volume of Water just before issue for use.

Extemporaneous preparation

The following formula and directions apply.

Anhydrous Glucose	20 g
Sodium Chloride	3.5 g
Sodium Citrate	2.5 g
Water	Sufficient to produce 1000 ml

Dissolve the dry ingredients in Water and add sufficient Water to produce 1000 ml.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of glucose, $C_6H_{12}O_6$

1.9 to 2.1% w/v.

Content of sodium chloride, NaCl

0.33 to 0.37% w/v.

Content of sodium citrate, $C_6H_5Na_3O_7,2H_2O$

0.24 to 0.26% w/v.

IDENTIFICATION

A. Heat 10 ml with *cupri-tartaric solution R1.* A red precipitate is produced.

B. Yields reaction A characteristic of *sodium* salts, reaction A characteristic of *chlorides* and the reactions characteristic of *citrates*, Appendix VI.

C. The solution prepared as directed in the Assay for glucose is dextrorotatory.

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

ASSAY

For glucose

To 100 ml of the solution add 0.2 ml of 5M *ammonia* and mix well. Allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. Multiply the observed rotation in degrees by 0.9477, then by 1.002 and then by 10 to calculate the weight in grams of glucose, $C_6H_{12}O_6$, in the original powder.

For sodium chloride

Titrate 20 ml of the solution with 0.1M *silver nitrate VS* using *potassium chromate solution* as indicator. Each ml of *silver nitrate VS* is equivalent to 5.844 mg of NaCl.

For sodium citrate

Evaporate 25 ml of the solution almost to dryness on a rotary evaporator, add 10 ml of *acetone* and evaporate to dryness. Add 10 ml of *acetone*, 10 ml of *acetic anhydride* and 20 ml of *anhydrous acetic acid* to the residue and warm to about 60° until dissolution is complete. Allow to cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.25 ml of *crystal violet solution* as indicator, titrating to a blue end point. Each ml of 0.1M *perchloric acid VS* is equivalent to 9.803 mg of $C_6H_5Na_3O_7,2H_2O$.

STORAGE

Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution should be stored at a temperature of 2° to 8°.

LABELLING

The label states that any portion of the oral solution that remains unused 24 hours after preparation should be discarded.

Gallamine Injection

General Notices

Action and use

Non-depolarizing neuromuscular blocker.

DEFINITION

Gallamine Injection is a sterile solution of Gallamine Triethiodide in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of gallamine triethiodide, $C_{30}H_{60}I_3N_3O_3$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 225 nm.

B. To 1 ml add 1 ml of *iodinated potassium iodide solution*. A brown precipitate is produced.

C. To 1 ml add 1 ml of *potassium tetraiodomercurate solution*. A yellow precipitate is produced.

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing 0.060% w/v of Gallamine Triethiodide. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.3% w/v of *gallamine impurity standard BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with particles of silica the surface of which has been modified with a mixture of chemically-bonded octylsilyl and octadecylsilyl groups and treated to reduce the level of residual silanol groups (5 µm) (HiChrom RPB is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared as described below, (c) a detection wavelength of 205 nm and (d) a column temperature of 40°. For the mobile phase dissolve 14 g of *sodium perchlorate* in 850 ml of a solution prepared by diluting 0.7 ml of *orthophosphoric acid* to 900 ml with *water*, adjusting to pH 3.0 with 10M *sodium hydroxide* and diluting to 1000 ml with *water*, and add 130 ml of *methanol*.

Inject separately 20 µl of each solution. For solution (1) allow the chromatography to proceed for 1.5 times the retention time of gallamine as perchlorate.

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *gallamine impurity standard BPCRS*.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of all the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%). Disregard the peak due to iodide (non-retained peak).

ASSAY

Dilute a volume containing 40 mg of Gallamine Triethiodide with sufficient 0.01M *hydrochloric acid* to produce 200 ml. Dilute 5 ml of this solution to 100 ml with 0.01M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 225 nm, Appendix II B. Calculate the content of $C_{30}H_{60}I_3N_3O_3$ taking 525 as the value of A(1%, 1 cm) at the maximum at 225 nm.

STORAGE

Gallamine Injection should be protected from light.

IMPURITIES

The impurities limited by this monograph include those listed in the monograph for Gallamine Triethiodide.

Gemfibrozil Capsules

General Notices

Action and use

Fibrate lipid-regulating drug.

DEFINITION

Gemfibrozil Capsules contain Gemfibrozil.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of gemfibrozil, $C_{15}H_{22}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing about 0.5 g of Gemfibrozil with 10 ml of n-*hexane* for 10 minutes, filter through a filter paper previously washed with 20 ml of n-*hexane*, evaporate the filtrate to dryness on a water bath and then dry over *silica gel* at a pressure of 2 kPa for 2 hours or until a waxy solid is obtained. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of gemfibrozil *(RS 167)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.2M *phosphate buffer pH 7.5* and rotate the paddle at 50 revolutions per minute. Withdraw a 10 ml sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 276 nm, Appendix II B. At the same time measure the *absorbance* at the maximum at 276 nm of a suitable solution of *gemfibrozil BPCRS* in the dissolution medium, adding the minimum volume of 0.1M *sodium hydroxide*, if necessary, to complete dissolution. Calculate the total content of gemfibrozil, $C_{15}H_{22}O_3$, in the medium from the absorbances obtained and from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.4 g of Gemfibrozil with 100 ml of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 5 volumes with the mobile phase. Solution (3) contains 0.0004% w/v of *gemfibrozil impurity A BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v of *gemfibrozil methyl ester BPCRS* and 0.0004% w/v of *gemfibrozil impurity A BPCRS* in solution (2).

The chromatographic procedure described under Assay may be used. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0 and the *resolution factor* between the peaks due to gemfibrozil methyl ester and gemfibrozil impurity A is at least 1.2.

In the chromatogram obtained with solution (1) the area of any peak corresponding to gemfibrozil impurity A is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.1%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* other than any peak corresponding to gemfibrozil impurity A is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol* to a quantity of the mixed contents of 20 capsules containing 0.15 g of Gemfibrozil, shake on a mechanical shaker for 10 minutes, add 20 ml of *water*, 1 ml of *glacial acetic acid* and sufficient *methanol* to produce 100 ml, mix and filter (Whatman GF/C paper is suitable), discarding the first 20 ml of filtrate. Dilute 1 volume of the filtrate to 5 volumes with the mobile phase. For solution (2) dissolve 30 mg of *gemfibrozil BPCRS* in 80 ml of *methanol*, add 1 ml of *glacial acetic acid* and dilute to 100 ml with *water*. Solution (3) contains 0.01% w/v of *gemfibrozil methyl ester BPCRS* in a solution prepared by diluting 1 volume of solution (1) to 3 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 or Regis C18 are suitable), (b) a mixture of 1 volume of *glacial acetic acid*, 19 volumes of *water* and 80 volumes of *methanol* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 276 nm.

Inject 20 µl of each solution. The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0.

Calculate the content of $C_{15}H_{22}O_3$ in the capsules from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS.*

Gemfibrozil Tablets

General Notices

Action and use

Fibrate lipid-regulating drug.

DEFINITION

Gemfibrozil Tablets contain Gemfibrozil.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gemfibrozil, $C_{15}H_{22}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a quantity of the powdered tablets containing 0.3 g of Gemfibrozil with 10 ml of 0.1M *sodium hydroxide*, filter (Whatman 541 paper is suitable), acidify with a few drops of 2M *sulphuric acid*, shake and centrifuge. Wash the precipitate with *water*, allow to dry in air and dry over *anhydrous silica gel* at a pressure of 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of gemfibrozil *(RS 167)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.2M *phosphate buffer pH 7.5* and rotate the paddle at 50 revolutions per minute. Withdraw a 10 ml sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 276 nm, Appendix II B. At the same time measure the *absorbance* at the maximum at 276 nm of a suitable solution of *gemfibrozil BPCRS* prepared by dissolving the substance in the minimum volume of *methanol* and diluting with 0.2M *phosphate buffer pH 7.5*. Calculate the total content of gemfibrozil, $C_{15}H_{22}O_3$, in the medium from the absorbances obtained and from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.6 g of Gemfibrozil with 70 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 5 volumes with the mobile phase. Solution (3) contains 0.0006% w/v of *gemfibrozil impurity A BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v of *gemfibrozil methyl ester BPCRS* and 0.0004% w/v of *gemfibrozil impurity A*

BPCRS in solution (2).

The chromatographic procedure described under Assay may be used. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0 and the *resolution factor* between the peaks due to gemfibrozil methyl ester and gemfibrozil impurity A is at least 1.2.

In the chromatogram obtained with solution (1) the area of any peak corresponding to gemfibrozil impurity A is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.1%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* other than the peak corresponding to gemfibrozil impurity A is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 84 mg of Gemfibrozil with 80 ml of *methanol (80%)* on a mechanical shaker for 15 minutes, add sufficient *methanol (80%)* to produce 100 ml, mix and filter (Whatman 542 paper is suitable), discarding the first 20 ml of filtrate. Solution (2) contains 0.084% w/v of *gemfibrozil BPCRS* prepared by dissolving the substance in the minimum volume of *methanol* and diluting with *methanol (80%)*. Solution (3) contains 0.01% w/v of *gemfibrozil methyl ester BPCRS* in a solution prepared by diluting 1 volume of solution (1) to 10 volumes with a mixture of 2 volumes of *methanol* and 3 volumes of the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 or Regis C18 are suitable), (b) a mixture of 1 volume of *glacial acetic acid*, 19 volumes of *water* and 80 volumes of *methanol* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 276 nm.

Inject 20 µl of each solution. The test is not valid unless the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester in the chromatogram obtained with solution (3) is at least 4.0.

Calculate the content of $C_{15}H_{22}O_3$ in the tablets from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS.*

STORAGE

Gemfibrozil Tablets should be protected from light.

Gentamicin and Hydrocortisone Acetate Ear Drops

General Notices

Action and use

Aminoglycoside antibacterial (Gentamicin Sulphate); corticosteroid (Hydrocortisone Acetate).

DEFINITION

Gentamicin and Hydrocortisone Acetate Ear Drops contain Gentamicin Sulphate and Hydrocortisone Acetate suspended in a suitable vehicle.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Filter a volume of the ear drops diluted in *water*, if necessary, to produce a solution containing the equivalent of 0.3% w/v of gentamicin and use the filtrate.

(2) 0.5% w/v of *gentamicin sulphate EPCRS* in *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *dichloromethane* and *methanol* and allowing to separate.

(c) Develop to 15 cm.

(d) Application volume of 10 µl for each solution.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) are similar in position, colour and size to those in the chromatogram obtained with solution (2).

B. Comply with the test for Composition of gentamicin sulphate.

C. Filter 20 ml of the well-mixed ear drops (Whatman No. 1 filter paper is suitable), wash the residue with the minimum amount of *water*, dry at 105° and dissolve 50 mg of the residue obtained in 50 ml of *ethanol (96%)*. Add 2 ml of *sulphuric acid* to 2 ml of the resulting solution; an intense yellow colour is produced which exhibits a green fluorescence which is particularly intense when viewed under *ultraviolet light (365 nm)*. Add the solution to 10 ml of *water* and mix; the fluorescence under ultraviolet light (365 nm) does not disappear.

D. In the Assay for hydrocortisone acetate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.0, Appendix V L.

Composition of gentamicin sulphate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 ml of *methanol* to 10 ml of a 0.065% w/v solution of *gentamicin sulphate EPCRS*, swirl and add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare solution (2) in the same manner as solution (1) but using 10 ml of a solution prepared by diluting a suitable volume of the ear drops with *water* to contain the equivalent of 0.045% w/v of gentamicin.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with end-capped *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 330 nm.

(f) Injection volume of 5 µl for each solution.

MOBILE PHASE

0.025M *sodium heptanesulphonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (1), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (2) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the ear drops by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY

For gentamicin

Dilute a volume of the ear drops containing the equivalent of 15 mg of gentamicin to 50 ml with sterile *phosphate buffer pH 8.0* and dilute 10 ml of the resulting solution to 50 ml with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ear drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the ear drops containing 0.1 g of Hydrocortisone Acetate with 25 ml of *methanol*, add sufficient *methanol* to produce 100 ml and dilute 10 ml of this solution to 50 ml with mobile phase.

(2) Dilute 10 ml of a 0.1% w/v solution of *hydrocortisone acetate BPCRS* in *methanol* to 50 ml with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 256 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 400 volumes of *water* and 600 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{32}O_6$ in the ear drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Gentamicin and Hydrocortisone Acetate Ear Drops should not be allowed to freeze.

LABELLING

The quantity of Gentamicin Sulphate is stated in terms of the equivalent amount of gentamicin.

Gentamicin Cream

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Cream is a viscous oil-in-water emulsion containing Gentamicin Sulphate dissolved in the aqueous phase.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) disperse a quantity of the cream containing the equivalent of 7.5 mg of gentamicin in 20 ml of *chloroform*, extract with 10 ml of *water* and use the aqueous layer. Solution (2) is a solution of *gentamicin sulphate EPCRS* in *water* containing the equivalent of 0.075% w/v of gentamicin. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulphate, the retention times of the four principal peaks in the chromatogram obtained with solution (2) correspond to those of the four principal peaks in the chromatogram obtained with solution (1)

TESTS

Composition of gentamicin sulphate

Complies with the test described under Gentamicin Injection but preparing solution (2) in the following manner. Disperse a quantity of the cream containing the equivalent of 15 mg of gentamicin in 10 ml of *chloroform*, add 10 ml of a 0.25% w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer. Repeat the extraction with two 5 ml quantities of the sodium tetraborate solution, dilute the combined aqueous extracts to 25 ml with the same solution and filter. To 10 ml of the clear filtrate add 5 ml of *methanol*, swirl, add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat in a water bath at 60° for 15 minutes and cool.

ASSAY

Dissolve as completely as possible a quantity containing the equivalent of 3 mg of gentamicin in 20 ml of *chloroform* and shake vigorously with 75 ml of *phosphate buffer pH 8.0*. Dilute 10 ml of the aqueous extract to 50 ml with *phosphate buffer pH 8.0*. Carry out the *microbiological* *assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the cream, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin Ear Drops

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Ear Drops are a solution of Gentamicin Sulphate in Purified Water.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate. Apply separately to the plate (1) a volume of the ear drops containing the equivalent of 30 µg of gentamicin and (2) 0.1 mg of *gentamicin sulphate EPCRS* dissolved in a volume of *water* equal to the volume of the ear drops used. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulphate, the retention times of the four principal peaks in the chromatogram obtained with solution (2) correspond to those of the four principal peaks in the chromatogram obtained with solution (1).

TESTS

Composition of gentamicin sulphate

Comply with the test described under Gentamicin Injection, using for solution (2) a solution prepared in the same manner as solution (1) but using 10 ml of a solution prepared by diluting a suitable volume of the ear drops with *water* to contain the equivalent of 0.045% w/v of gentamicin.

ASSAY

Dilute a volume of the ear drops containing the equivalent of 15 mg of gentamicin to 50 ml with sterile *phosphate buffer pH 8.0* and dilute 10 ml of the resulting solution to 50 ml with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ear drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin Eye Drops

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Eye Drops are a sterile solution of Gentamicin Sulphate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate. Apply separately to the plate (1) a volume of the eye drops containing the equivalent of 30 µg of gentamicin and (2) 0.1 mg of *gentamicin sulphate EPCRS* dissolved in a volume of *water* equal to the volume of the eye drops used. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulphate, the retention times of the four principal peaks in the chromatogram obtained with solution (2) correspond to those of the four principal peaks in the chromatogram obtained with solution (1).

TESTS

Composition of gentamicin sulphate

Comply with the test described under Gentamicin Injection, using for solution (2) a solution prepared in the same manner as solution (1) but using 10 ml of a solution prepared by diluting a suitable volume of the eye drops with *water* to contain the equivalent of 0.045% w/v of gentamicin.

ASSAY

Dilute a volume of the eye drops containing the equivalent of 15 mg of gentamicin to 50 ml with sterile *phosphate buffer pH 8.0* and dilute 10 ml of the resulting solution to 50 ml with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the eye drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin Injection

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Injection is a sterile solution of Gentamicin Sulphate in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate. Apply separately to the plate (1) a volume of the injection containing the equivalent of 30 µg of gentamicin and (2) 0.1 mg of *gentamicin sulphate EPCRS* dissolved in a volume of *water* equal to the volume of the injection used. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulphate, the retention times of the four principal peaks in the chromatogram obtained with solution (2) correspond to those of the four principal peaks in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L.

Composition of gentamicin sulphate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of *methanol* to 10 ml of a 0.065% w/v solution of *gentamicin sulphate EPCRS,* swirl and add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours. Prepare solution (2) in the same manner as solution (1) but using 10 ml of a solution prepared by diluting a suitable volume of the injection with *water* to contain the equivalent of 0.045% of gentamicin.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 to 12.5 cm × 4.6 to 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) 0.025M *sodium heptanesulphonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 330 nm.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

The test is not valid unless, in the chromatogram obtained with solution (1), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

Using the chromatogram obtained with solution (2) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the injection by *normalisation*. The proportions are within the following limits: C_1, 25.0 to 50.0%; C_{1a}, 10.0 to 35.0%; C_2 plus C_{2a}, 25.0 to 55.0%.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing the equivalent of 10 mg of gentamicin per ml (solution A). The endotoxin limit concentration of solution A is 16.7 IU per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the injection, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

LABELLING

The strength is stated in terms of the equivalent amount of gentamicin in a suitable dose-volume.

Gentamicin Ointment

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Ointment is a dispersion of Gentamicin Sulphate in *microfine powder* in White Soft Paraffin or other suitable anhydrous greasy basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) disperse a quantity of the ointment containing the equivalent of 7.5 mg of gentamicin in 20 ml of *chloroform*, extract with 10 ml of *water* and use the aqueous layer. Solution (2) is a solution of *gentamicin sulphate EPCRS* in *water* containing the equivalent of 0.075% w/v of gentamicin. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes. The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulphate, the retention times of the four principal peaks in the chromatogram obtained with solution (2) correspond to those of the four principal peaks in the chromatogram obtained with solution (1).

TESTS

Composition of gentamicin sulphate

Complies with the test described under Gentamicin Injection but preparing solution (2) in the following manner. Disperse a quantity of the ointment containing the equivalent of 20 mg of gentamicin in 10 ml of *chloroform*, add 20 ml of a 0.25% w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer. Filter and dilute to 50 ml with *water*. To 10 ml add 5 ml of *methanol*, swirl, add 4 ml of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 ml, heat in a water bath at 60° for 15 minutes and cool.

ASSAY

Dissolve as completely as possible a quantity containing the equivalent of 4 mg of gentamicin in 50 ml of *chloroform*, extract with three 20 ml quantities of *phosphate buffer pH 8.0* and dilute the combined extracts to 100 ml with *phosphate buffer pH 8.0*. Dilute 10 ml of the resulting solution to 50 ml with *phosphate buffer pH 8.0*. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ointment, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Glibenclamide Tablets

General Notices

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Glibenclamide Tablets contain Glibenclamide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of glibenclamide, $C_{23}H_{28}ClN_3O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Dissolution

Prepare a mixture containing 0.8134% w/v of *anhydrous disodium hydrogen phosphate* and 0.1350% w/v of *potassium dihydrogen orthophosphate* (solution A).

Comply with the *dissolution test for tablets and capsules,* Appendix XII B1, using Apparatus 2. Use as the medium 1000 ml of solution A and rotate the paddle at 100 revolutions per minute. Withdraw 10 ml of the medium at 20 minutes and 90 minutes, filter (Minisart GS 25mm filters are suitable) discarding the first 5 ml of the filtrate. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dissolve *glibenclamide BPCRS* in the minimum quantity of *methanol* and dilute to an appropriate concentration with solution A.

(2) The filtrate from the dissolution vessel.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Isocratic system using the mobile phase below.

(c) Flow rate of 1.0 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 225 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 40 volumes of 0.1M *potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile.*

DETERMINATION OF CONTENT

Calculate the total content of glibenclamide, $C_{23}H_{28}ClN_3O_5S$, in the medium from the chromatograms obtained and using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS.*

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 20 mg of Glibenclamide with four 5-ml quantities of a mixture of 20 volumes of *dichloromethane* and 10 volumes of *acetone*, evaporate the combined extracts to dryness at a temperature not exceeding 40° at a pressure of 2 kPa and dissolve the residue in 4 ml of a mixture of equal volumes of *chloroform* and *methanol*.

(2) 0.012% w/v of *4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulphonamide BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

(3) 0.0020% w/v of *methyl* N-*4-[2-(5-chloro-2-methoxybenzamido)ethyl] benzenesulphonylcarbamate BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

(4) 0.5% w/v of *glibenclamide BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* GF_{254}.

(b) The mobile phase is a mixture of 5 volumes of *ethanol (96%)*, 5 volumes of *glacial acetic acid*, 45 volumes of *chloroform* and 45 volumes of *cyclohexane*.

(c) Application volume of 10 µl of each solution.

(d) Develop to 15 cm.

(e) Remove the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

LIMITS

In the chromatogram obtained with solution (1), any spots corresponding to 4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulphonamide and methyl *N*-4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulphonylcarbamate are not more intense than the spots in the chromatograms obtained with solutions (2)(2.4%) and (3)(0.4%) respectively.

Uniformity of content

Tablets containing 5 mg or less of Glibenclamide comply with the requirements stated under

Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Powder one tablet, add a mixture of 2 ml of *water* and 20 ml of *methanol*, mix with the aid of ultrasound until fully dispersed and filter through a 0.2-µm membrane filter (Anatop LC is suitable).

(2) Add 2 ml of *water* to 20 ml of a 0.025% w/v solution of *glibenclamide BPCRS* in *methanol*, mix with the aid of ultrasound until fully dispersed and filter (0.2-µm Anatop LC is suitable).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in each tablet using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing 5 mg of Glibenclamide with a mixture of 2 ml of *water* and 20 ml of *methanol* until fully dispersed and filter through a 0.2-µm membrane filter (Anatop LC is suitable).

(2) Dissolve 50 mg of *glibenclamide BPCRS* in 10 ml of *methanol* with the aid of ultrasound for 20 minutes, add sufficient *methanol* to produce 50 ml and dilute 1 volume of this solution to 4 volumes with *methanol*. To 20 ml of this solution add 2 ml of *water* and mix.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Isocratic system using the mobile phase below.

(c) Flow rate of 1.5 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 300 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 47 volumes of *acetonitrile* and 53 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS*.

Gliclazide Tablets

General Notices

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Gliclazide Tablets contain Gliclazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gliclazide, $C_{15}H_{21}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.16 g of Gliclazide with 20 ml of *dichloromethane*, centrifuge and evaporate the supernatant liquid to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of gliclazide *(RS 168)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the dissolution medium 900 ml of *phosphate buffer pH 7.4* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter through a 0.5-µm filter. Measure the *absorbance* of the filtrate diluted, if necessary, with the dissolution medium to an expected concentration of 12.5 µg per ml of Gliclazide, Appendix II B, at 226 nm and 290 nm using the dissolution medium in the reference cell. Correct the absorbance obtained at 226 nm by subtracting the absorbance obtained at 290 nm. Calculate the total content of gliclazide, $C_{15}H_{21}N_3O_3S$, in the medium using the *absorbance* of a solution prepared by dissolving 62.0 mg of *gliclazide BPCRS* in 20 ml of *methanol*, adding sufficient dissolution medium to produce 1000 ml and diluting 1 volume of this solution to 5 volumes with the dissolution medium and using the declared content of $C_{15}H_{21}N_3O_3S$ in *gliclazide BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions without delay. For solution (1) shake a quantity of the powdered tablets containing 0.8 g of Gliclazide for 1 hour with 200 ml of *acetonitrile*, filter and dilute 10 ml of the filtrate to 50 ml with a mixture of 1 volume of *acetonitrile* and 2 volumes of *water*. For solution (2) dilute 1 volume of solution (1) to 500 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*. For solution (3) dissolve 5 mg of *gliclazide BPCRS* and 15 mg of *1-(3-*

*azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea BPCRS* in 25 ml of *acetonitrile*, dilute to 50 ml with *water* and dilute 1 volume of the resulting solution to 20 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*. For solution (4) dissolve 8 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea BPCRS* in 25 ml of *acetonitrile*, dilute to 50 ml with *water* and dilute 1 volume of the resulting solution to 100 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (4 µm) (Superspher 60RP8 is suitable), (b) a mixture of 0.1 volume of *triethylamine*, 0.1 volume of *trifluoroacetic acid*, 45 volumes of *acetonitrile* and 55 volumes of *water* as the mobile phase with a flow rate of 0.9 ml per minute and (c) a detection wavelength of 235 nm. Inject separately 20 µl of each solution. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless the *resolution factor* between the peaks in the chromatogram obtained with solution (3) is at least 1.8.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%), the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any other *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.4%). Disregard any peak with an area less than one quarter of the area of the peak corresponding to gliclazide in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.8 g of Gliclazide for 1 hour with 200 ml of *acetonitrile*, filter and dilute 10 ml of the filtrate to 200 ml with a mixture of 2 volumes of *acetonitrile* and 3 volumes of *water*. For solution (2) dissolve 40 mg of *gliclazide BPCRS* in 10 ml of *acetonitrile* and dilute to 200 ml with a mixture of 2 volumes of *acetonitrile* and 3 volumes of *water*. For solution (3) dissolve 5 mg of *gliclazide BPCRS* and 15 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulphonylurea BPCRS* in 25 ml of *acetonitrile*, dilute to 50 ml with *water* and dilute 1 volume of the resulting solution to 20 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

The chromatographic procedure described under Related substances may be used.

The test is not valid unless the *resolution factor* between the peaks in the chromatogram obtained with solution (3) is at least 1.8.

Calculate the content of $C_{15}H_{21}N_3O_3S$ in the tablets using the declared content of $C_{15}H_{21}N_3O_3S$ in *gliclazide BPCRS*.

Glipizide Tablets

General Notices

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Glipizide Tablets contain Glipizide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of glipizide $C_{21}H_{27}N_5O_4S$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 320 nm of the final solution obtained in the Assay exhibits maxima at 226 nm and 274 nm.

B. Shake a quantity of the powdered tablets containing 25 mg of Glipizide with 10 ml of *dichloromethane* for 5 minutes, filter, dry the filtrate with *anhydrous sodium sulphate*, filter again and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of glipizide *(RS 169)*.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel GF_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *ethyl acetate*, 20 volumes of *anhydrous formic acid* and 40 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Glipizide with four 10 ml quantities of *acetone*, evaporate the combined extracts to dryness under reduced pressure at a temperature not exceeding 30° and dissolve the residue in sufficient of a mixture of equal volumes of *dichloromethane* and *methanol* to produce 5 ml. For solution (2) dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of *dichloromethane* and *methanol* . For solution (3) dilute 1 volume of solution (1) to 500 volumes with the same solvent mixture. Solution (4) contains 0.010% w/v of *glipizide impurity A EPCRS* (4-[2-(5-methylpyrazine-2-carboxamido)ethyl]benzenesulphonamide) in a mixture of equal volumes of *dichloromethane* and *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to glipizide impurity A in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (0.5%). Any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 15 mg of Glipizide add 30 ml of *methanol*, heat gently on a water bath whilst shaking, cool and add sufficient *methanol* to produce 50 ml. Filter and dilute 5 ml of the filtrate to 50 ml with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 274 nm, Appendix II B, using *methanol* in the reference cell. Calculate the content of $C_{21}H_{27}N_5O_4S$ taking 237 as the value of A(1%, 1 cm) at the maximum at 274 nm.

Gliquidone Tablets

General Notices

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Gliquidone Tablets contain Gliquidone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gliquidone, $C_{27}H_{33}N_3O_6S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 30 mg of Gliquidone in 10 ml of *methanol* with the aid of ultrasound, filter, evaporate the filtrate to dryness using a rotary evaporator and dry the residue at a temperature of 50° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of gliquidone *(RS 170)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of a citro-phosphate buffer prepared by dissolving 35.6 g of *disodium hydrogen orthophosphate dihydrate* in sufficient *water* to produce 1000 ml, adjusting the pH to 8.5 with *citric acid*, and rotate the paddle at 75 revolutions per minute. Withdraw a sample of 50 ml of the medium and filter (Whatman No. 1 filter paper is suitable), discarding the first 15 ml of filtrate. Measure the *absorbance* of the filtered solution, Appendix II B, at the maximum at 314 nm using a filtered solution of the dissolution medium in the reference cell. Measure the *absorbance* of a solution of *gliquidone BPCRS* prepared in the following manner. Dissolve about 30 mg of *gliquidone BPCRS* in 10 ml of *dimethylformamide*, add sufficient dissolution medium to produce 100 ml and mix. Dilute 10 ml of this solution to 100 ml with dissolution medium, mix and filter (Whatman No. 1 filter paper is suitable), discarding the first 15 ml of filtrate. Calculate the total content of gliquidone, $C_{27}H_{33}N_3O_6S$, in the medium from the absorbances obtained and from the declared content of $C_{27}H_{33}N_3O_6S$ in *gliquidone BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of 5 volumes of *glacial acetic acid*, 5 volumes of *ethanol (96%)*, 45 volumes of *chloroform* and 45 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µl of each of the following five solutions. For solution (1) mix a quantity of the powdered tablets containing 0.1 g of Gliquidone with 8 ml of a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*, mix with the aid of ultrasound for 10 minutes, add sufficient of the same solvent mixture to produce 10 ml, filter (Whatman GF/C filter paper is suitable) and use the filtrate. Solution (2) contains 1.0% w/v of *gliquidone BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. Solution (3) contains 0.0030% w/v of *gliquidone BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. Solution (4) contains 0.010% w/v of *gliquidone sulphonamide BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. For solution (5) mix 1 volume of solution (3) and 1 volume of solution (4). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to gliquidone sulphonamide is not more intense than the spot in the chromatogram obtained with solution (4) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%). The test is not valid unless the chromatogram obtained with solution (5) shows two clearly separated principal spots.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 0.1 g of Gliquidone add 50 ml of *methanol*, mix with the aid of ultrasound for 10 minutes, allow to cool, add sufficient *methanol* to produce 100 ml and filter. Dilute 15 ml of the filtrate to 100 ml with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 310 nm, Appendix II B. Calculate the content of $C_{27}H_{33}N_3O_6S$ in the tablets from the *absorbance* of a 0.015% w/v solution of *gliquidone BPCRS* in *methanol* and using the declared content of $C_{27}H_{33}N_3O_6S$ in *gliquidone BPCRS*.

Glucose Intravenous Infusion

General Notices

Glucose Injection

DEFINITION

Glucose Intravenous Infusion is a sterile solution of Anhydrous Glucose or Glucose in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of glucose, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution. Solutions containing the equivalent of 200 g per litre or more of glucose, $C_6H_{12}O_6$, may be not more than faintly yellow in colour.

IDENTIFICATION

A. Heat with *cupri-tartaric solution R1.* A red precipitate is produced.

B. The solution prepared as directed in the Assay is dextrorotatory.

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L, when determined on a solution diluted, if necessary, with *water for injections*, to contain not more than the equivalent of 5% w/v of glucose, $C_6H_{12}O_6$, and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

5-Hydroxymethylfurfural and related substances

Dilute a volume containing the equivalent of 1.0 g of glucose, $C_6H_{12}O_6$, to 250 ml with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

Bacterial endotoxins

The endotoxin limit concentration is 0.25 IU per ml, Appendix XIV C. Dilute infusions containing more than 5% w/v of Glucose with *water BET* to contain 5% w/v.

ASSAY

To a volume containing the equivalent of 2 g to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 ml of 5M *ammonia* and sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight in g of glucose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING

The strength is stated as the equivalent number of grams of glucose, $C_6H_{12}O_6$, per litre.

When Glucose Intravenous Infusion is required as a diluent for Injections or Intravenous Infusions of the Pharmacopoeia, Glucose Intravenous Infusion (50 g per litre) shall be used.

Glucose Irrigation Solution

General Notices

DEFINITION

Glucose Irrigation Solution is a sterile solution of Anhydrous Glucose or Glucose in Water for Irrigation.

The irrigation solution complies with the requirements stated under Preparations for Irrigation and with the following requirements.

Content of glucose, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution. Solutions containing the equivalent of 200 g per litre or more of glucose, $C_6H_{12}O_6$, may be not more than faintly straw coloured.

IDENTIFICATION

A. Heat with *cupri-tartaric solution R1*. A red precipitate is produced.

B. The solution prepared in the Assay is dextrorotatory.

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L, when determined in a solution diluted, if necessary, with *water* to contain not more than the equivalent of 5% w/v of glucose, $C_6H_{12}O_6$, and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

5-Hydroxymethylfurfural and related substances

Dilute a volume containing the equivalent of 1.0 g of glucose, $C_6H_{12}O_6$, to 250 ml with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

ASSAY

To a volume containing the equivalent of 2 to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 ml of 5M *ammonia* and sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of glucose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING

The strength is stated in terms of the equivalent amount of glucose, $C_6H_{12}O_6$.

Glutaraldehyde Solution

General Notices

DEFINITION

Glutaraldehyde Solution is a dilution of Strong Glutaraldehyde Solution in a mixture of Purified Water and Ethanol (96 per cent).

In making Glutaraldehyde Solution, Ethanol (96 per cent) may be replaced by Industrial Methylated Spirit[1].

Content of glutaraldehyde, $C_5H_8O_2$

9.2 to 10.5% w/v.

IDENTIFICATION

A. Heat 5 ml with 10 ml of a solution containing 1 g of *hydroxylamine hydrochloride* and 2 g of *sodium acetate* on a water bath for 10 minutes, allow to cool and filter. The *melting point* of the residue, after washing with *water* and drying at 105°, is about 178°, Appendix V A.

To 1 ml add 2 ml of *ammoniacal silver nitrate solution* and mix gently for a few minutes. Silver is deposited.

TESTS

Ethanol content

50.0 to 60.0% v/v, Appendix VIII F.

ASSAY

Mix 10 ml with 100 ml of a 7% w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with 1M *sodium hydroxide VS* and allow to stand for 30 minutes. Add 20 ml of *petroleum spirit (boiling range, 40° to 60°)* and titrate with 1M *sodium hydroxide VS* until the colour of the aqueous phase matches that of a 7% w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with 1M *sodium hydroxide VS*. Each ml of 1M *sodium hydroxide VS* is equivalent to 50.05 mg of $C_5H_8O_2$.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

---

[1] The law and the statutory regulations governing the use of Industrial Methylated Spirit must be observed.

Glycerol Eye Drops

General Notices

DEFINITION

Glycerol Eye Drops are a sterile solution of Glycerol in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of glycerol, $C_3H_8O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix 1 ml of the eye drops with 0.5 ml of *nitric acid* and superimpose 0.5 ml of *potassium dichromate solution*. A blue ring develops at the interface of the liquids, which does not diffuse into the lower layer within 10 minutes.

TESTS

Acidity or alkalinity

pH, 4.5 to 7.5, Appendix V L.

ASSAY

Dilute a suitable volume of the eye drops with sufficient *water* to produce a solution containing 3% w/v of Glycerol. To 5 ml add 150 ml of *water* and neutralise with 0.1M *sodium hydroxide VS*, using *bromocresol purple solution* as indicator. Add 1.6 g of *sodium periodate* and allow to stand protected from light for 15 minutes. Add 3 ml of *propan-1,2-diol*, shake, allow to stand protected from light for 5 minutes and titrate with 0.1M *sodium hydroxide VS*. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 9.21 mg of $C_3H_8O_3$.

STORAGE

Glycerol Eye Drops should be protected from light.

Strengths available

Eye Drops containing 10, 20, 30 and 50% w/v of glycerol are available.

Glycerol Suppositories

General Notices

Glycerin Suppositories

DEFINITION

Gelatin	14 g
Glycerol	70 g
Purified Water	A sufficient quantity

In tropical and subtropical countries the quantity of Gelatin may be increased to an amount not exceeding 18 g.

Extemporaneous preparation

The following directions apply.

Add the Gelatin to about 30 ml of Purified Water heated nearly to boiling, then add the Glycerol previously heated to 100° and heat the mixture on a water bath for 15 minutes or until solution is complete. Adjust the weight of the product to 100 g by the addition of hot Purified Water or by evaporation on a water bath and pour into suitable moulds.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of glycerol, $C_3H_8O_3$

66.5 to 73.5% w/w.

Disintegration

Maximum time, 1 hour, Appendix XII A2.

ASSAY

Dissolve a number of suppositories containing 8 g of Glycerol in 50 ml of *water* and add sufficient *water* to produce 250 ml. To 5 ml add 150 ml of *water* and 0.25 ml of *bromocresol purple solution* and neutralise with 0.1M *sodium hydroxide VS* to the blue colour of the indicator. Add 1.6 g of *sodium periodate* and allow to stand for 15 minutes. Add 3 ml of *propan-1,2-diol*, shake, allow to stand for 5 minutes and titrate with 0.1M *sodium hydroxide VS* to the same blue colour. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 9.210 mg of $C_3H_8O_3$.

Glyceryl Trinitrate Sublingual Spray

General Notices

DEFINITION

Glyceryl Trinitrate Sublingual Spray contains Glyceryl Trinitrate Solution in a suitable vehicle either in a suitable pressurised container or in a container fitted with a spray device.

PRODUCTION

A suitable test is carried out to demonstrate the uniformity of dose.

The oromucosal spray complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

80.0 to 120.0% of the amount stated to be delivered per metered dose.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel plates are suitable) and a mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) expel a number of metered doses containing the equivalent of about 4 mg of glyceryl trinitrate into a beaker, add 5 ml of *acetone*, transfer to a graduated flask and add sufficient *acetone* to produce 10 ml. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with methanol (50%) to produce a solution containing 0.04% w/v of glyceryl trinitrate. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air and spray with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) expel a number of metered doses containing the equivalent of about 5 mg of glyceryl trinitrate into a beaker, dilute to 5 ml with *methanol*, mix well and add sufficient *water* to produce 10 ml. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol (50%).* For solution (3) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water* and (c) a detection wavelength of 210 nm.

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of areas of any *secondary peaks* is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) collect 10 metered doses in a vessel avoiding loss of material, dissolve the expelled material in *methanol* and dilute with sufficient *methanol* to produce a solution containing the equivalent of 0.04% w/v of glyceryl trinitrate. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol (50%)* to produce a solution containing 0.04% w/v of glyceryl trinitrate.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.3 ml per minute a mixture of 50 volumes of *methanol* and 50 volumes of *water* and (c) a detection wavelength of 225 nm.

Calculate the content of $C_3H_5N_3O_9$ per metered dose using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

LABELLING

The label states (1) the instructions for using the spray; (2) the amount of glyceryl trinitrate delivered per metered dose; (3) the number of deliveries available from the container.

Glyceryl Trinitrate Tablets

General Notices

Glyceryl Trinitrate Sublingual Tablets; Trinitrin Tablets; Nitroglycerin Tablets

DEFINITION

Glyceryl Trinitrate Tablets are *sublingual tablets* made with Mannitol as the basis and may be prepared by adding Glyceryl Trinitrate Solution of an appropriate concentration to dried granules of Mannitol, mixing intimately, drying at a temperature not exceeding 50° or without heating for not more than 4 hours and compressing.

CAUTION Undiluted glyceryl trinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

85.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 0.5 mg of glyceryl trinitrate with 1 ml of *acetone* and centrifuge. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *water* to produce a solution containing 0.05% w/v of glyceryl trinitrate. After removal of the plate, dry it in a stream of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (365 nm)*. Examine the plate in daylight. The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Extract a quantity of the powdered tablets containing 3 mg of glyceryl trinitrate with 5 ml of *ether* and filter. Evaporate the ether and dissolve the residue in 0.2 ml of *sulphuric acid* containing a trace of *diphenylamine*. An intense blue colour is produced.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the powdered tablets containing 2.5 mg of glyceryl trinitrate with 10 ml of *acetonitrile* with the aid of ultrasound, filter through a 4-µm filter and dilute one volume of the filtrate with an equal volume of *water*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water* and (c) a detection wavelength of 210 nm.

Inject 50 µl of each solution and, for solution (1), allow the chromatography to proceed for three times the retention time of the principal peak. The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Tablets containing less than 2 mg of glyceryl trinitrate comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 2 ml of *acetonitrile* to one tablet, mix with the aid of ultrasound for 5 minutes, filter through a 4-µm filter and dilute 1 volume of the filtrate with an equal volume of *water*. For solution (2) dilute *glyceryl trinitrate solution BPCRS* with the mobile phase to produce a solution containing the equivalent amount of glyceryl trinitrate as that expected for solution (1). For solution (3) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

The chromatographic conditions described under Related substances may be used.

Inject 50 µl of each solution. The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

Calculate the content of $C_3H_5N_3O_9$ in each tablet from the chromatograms obtained and using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

ASSAY

Use the average of the 10 individual results obtained from the test for Uniformity of content.

STORAGE

Glyceryl Trinitrate Tablets should be protected from light and stored in a glass container closed by means of a screw closure lined with aluminium or tin foil; additional packing that absorbs glyceryl trinitrate should be avoided. Glyceryl Trinitrate Tablets should be issued for patients in containers of not more than 100 tablets.

LABELLING

The label states the amount of glyceryl trinitrate per tablet.

Glyceryl Trinitrate Transdermal Patches

General Notices

DEFINITION

Glyceryl Trinitrate Transdermal Patches contain glyceryl trinitrate in a suitable matrix or reservoir presentation. They are prepared from Glyceryl Trinitrate Solution.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of glyceryl trinitrate.

The transdermal patches comply with the requirements stated under Transdermal Patches and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel plates are suitable) and a mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) clean the outer surface of a patch using a lint-free cloth moistened with *methanol*. Remove the release liner and score the exposed surface. Place the patch in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes and then shake mechanically at room temperature for 3 hours. Dilute the methanolic extract with sufficient *water* to produce a final concentration of 0.05% w/v of glyceryl trinitrate. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with *methanol (50%)* to produce a solution containing 0.05% w/v of glyceryl trinitrate. After removal of the plate, allow it to dry in air and spray with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds in colour, position and size to that in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) clean the outer surface of five patches using a lint-free cloth moistened with *methanol*. Remove the release liners and score the exposed surfaces. Place the patches in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes and then shake mechanically at room temperature for 3 hours. Dilute the methanolic extract with sufficient *water* to produce a final concentration of 0.05% w/v of glyceryl trinitrate. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol (50%).* For solution (3) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water* and (c) a detection wavelength of 210 nm.

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of areas of any *secondary peaks* is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Comply with the requirements stated under *uniformity of content*, Appendix XII C3, Test C, with respect to the individual content of each dosage unit and using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) clean the outer surface of a patch using a lint-free cloth moistened with *methanol*. Remove the release liner and score the exposed surface. Place the patch in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes, shake mechanically at room temperature and dilute a volume of the solution with an equal volume of *water*. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol (50%)* to produce a solution containing 0.05% w/v of glyceryl trinitrate.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_3H_5N_3O_9$ in the transdermal patch using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

ASSAY

Use the average of the 10 results obtained in the test for Uniformity of content.

LABELLING

The quantity of active ingredient is stated in terms of the amount of glyceryl trinitrate per patch.

IMPURITIES

A. Glyceryl-1,2-dinitrate,

B. Glyceryl-1,3-dinitrate.

Glycine Irrigation Solution

General Notices

DEFINITION

Glycine Irrigation Solution is a sterile solution of Glycine in Water for Irrigation.
The irrigation solution complies with the requirements stated under Preparations for Irrigation and with the following requirements.

Content of glycine, $C_2H_5NO_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Evaporate 5 ml to dryness on a water bath and dry at 105° for 1 hour. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of glycine *(RS 171)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 30 volumes of 13.5M *ammonia* and 70 volumes of *propan-1-ol* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dilute the irrigation solution with *water* to contain 0.25% w/v of Glycine. Solution (2) contains 0.25% w/v of *glycine* in *water*. After removal of the plate, dry it at 100° to 105° for 10 minutes, spray with *ninhydrin solution* and heat at 100° to 105° for 2 minutes. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 6.5, Appendix V L.

Ammonium compounds

Dilute a volume containing 0.2 g of Glycine to 70 ml with *water* in an ammonia-distillation apparatus, add 25 ml of a solution prepared by boiling 25 ml of 5M *sodium hydroxide* with 50 ml of *water* and 50 mg of *aluminium* until the volume is reduced to 25 ml and distil into 2 ml of a saturated solution of *boric acid* until 50 ml is obtained. Add 2 ml of a solution prepared by boiling 25 ml of 5M *sodium hydroxide* with 50 ml of *water* until the volume is reduced to 25 ml and 2 ml of *alkaline potassium tetraiodomercurate solution*. Any colour produced is not more intense than that obtained by treating 70 ml of *water* containing 4 ml of *ammonia standard solution (10 ppm NH_4)* in the same manner, beginning at the words 'add 25 ml of…' (200 ppm, calculated with reference to the content of glycine).

ASSAY

Dilute a volume containing 0.15 g of Glycine to 25 ml with *water* and add 10 ml of *formaldehyde solution* previously adjusted to pH 9.0 and 0.25 ml of a mixed indicator solution prepared by dissolving 75 mg of *phenolphthalein* and 25 mg of *thymol blue* in 100 ml of *ethanol (50%)*. Titrate with 0.1M *sodium hydroxide VS* until the yellow colour disappears and a faint violet colour is produced. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 7.507 mg of $C_2H_5NO_2$.

Griseofulvin Tablets

General Notices

Action and use

Antibacterial.

DEFINITION

Griseofulvin Tablets contain Griseofulvin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of griseofulvin, $C_{17}H_{17}ClO_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.125 g of Griseofulvin with 20 ml of *chloroform*, add 1 g of *anhydrous sodium sulphate*, shake and filter. Evaporate the filtrate to dryness and dry at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of griseofulvin *(RS 172)*.

B. Shake a quantity of the powdered tablets containing 80 mg of Griseofulvin with 150 ml of *ethanol (96%)* for 20 minutes. Dilute to 200 ml with *ethanol (96%)* and filter. Dilute 2 ml of the filtrate to 100 ml with *ethanol (96%)*. The *light absorption* of the resulting solution, Appendix II B, in the range 240 to 400 nm exhibits two maxima, at 291 nm and 325 nm, and a shoulder at 250 nm.

C. Dissolve 5 mg of the powdered tablets in 1 ml of *sulphuric acid* and add 5 mg of powdered *potassium dichromate*. A red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 1000 ml of a 1.5% w/v solution of *sodium dodecyl sulphate* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtrate, suitably diluted if necessary with *methanol (80%)*, at the maximum at 291 nm, Appendix II B. Calculate the total content of $C_{17}H_{17}ClO_6$ in the medium taking 725 as the value of A(1%, 1 cm) at the maximum at 291 nm.

Related substances

Dissolve 50 mg of *9,10-diphenylanthracene* (internal standard) in sufficient *chloroform* to produce 50 ml (solution A). Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) dissolve 5 mg of *griseofulvin BPCRS* in *chloroform* and add 2 ml of solution A and sufficient *chloroform* to produce 200 ml. Evaporate 20 ml of the solution to about 1 ml. For solution (2) add 60 ml of *chloroform* to a quantity of the powdered tablets containing 50 mg of Griseofulvin, heat at 60° with shaking for 20 minutes, cool and dilute to 100 ml with *chloroform*. Centrifuge and evaporate 20 ml of the clear supernatant liquid to about 1 ml. Prepare solution (3) in the same manner as solution (2) but adding 1 ml of solution A before diluting to 100 ml with *chloroform*.

The chromatographic procedure may be carried out using a glass column (1.0 m × 4 mm) packed with acid-washed, *silanised diatomaceous support* (100 to 120 mesh) coated with 1% w/w of cyanopropylmethyl phenyl methyl silicone fluid (OV-225 is suitable) and maintained at 250°.

In the chromatogram obtained with solution (3) the ratios of the areas of any peak corresponding to dechlorogriseofulvin (retention time about 0.6 times that of griseofulvin) and of any peak corresponding to dehydrogriseofulvin (retention time about 1.4 times that of griseofulvin) to the area of the peak due to the internal standard are, respectively, not greater than 0.6 times and not greater than 0.15 times the ratio of the area of the peak due to griseofulvin to that of the internal standard in the chromatogram obtained with solution (1).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 35 mg of Griseofulvin add 60 ml of *ethyl acetate*, mix and heat to 60° with shaking for 20 minutes. Allow to cool and dilute to 100 ml with *ethyl acetate*. Centrifuge and transfer two 5 ml aliquots of the clear supernatant liquid into separate 100 ml graduated flasks. Add 5 ml of 2M *methanolic methanesulphonic acid* to the first flask, allow to stand at 20° for 30 minutes and dilute to 100 ml with *methanol* (solution A). Dilute the contents of the second flask to 100 ml with *methanol* (solution B). To a third flask add 5 ml of 2M *methanolic methanesulphonic acid* and dilute to 100 ml with *methanol* (solution C). Measure the *absorbance* of each solution at 266 nm, Appendix II B. Calculate the content of $C_{17}H_{17}ClO_6$ from the difference between the absorbance obtained with solution A and the sum of the absorbances obtained with solutions B and C and from the difference obtained by repeating the operation using 35 mg of *griseofulvin BPCRS* in place of the powdered tablets and from the declared content of $C_{17}H_{17}ClO_6$ in *griseofulvin BPCRS*.

Guanethidine Tablets

General Notices

Action and use

Adrenergic neuron blocker.

DEFINITION

Guanethidine Tablets contain Guanethidine Monosulphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of guanethidine monosulphate, $C_{10}H_{22}N_4,H_2SO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 50 mg of Guanethidine Monosulphate with a mixture of 5 ml of *hydrochloric acid* and 45 ml of *water*, filter, neutralise 25 ml of the filtrate with 5M *sodium hydroxide* and add 20 ml of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water*, is about 153°, Appendix V A.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 30 mg of Guanethidine Monosulphate for 15 minutes with 50 ml of *water*, dilute to 100 ml with *water* and filter. To 5 ml of the filtrate add 10 ml of a solution prepared by dissolving 1 g of *sodium nitroprusside* and 1 g of *potassium hexacyanoferrate(II)* in 50 ml of a 0.5% w/v solution of *sodium hydroxide*, adding 5 ml of *hydrogen peroxide solution (100 vol)*, swirling gently and diluting to 100 ml with the solution of sodium hydroxide. Mix, allow to stand for 20 minutes, add sufficient *water* to produce 25 ml and measure the *absorbance* of the resulting solution at 520 nm, Appendix II B, using in the reference cell a solution prepared by treating 5 ml of *water* in the same manner, beginning at the words 'add 10 ml of a solution…'. Repeat the operation using 5 ml of a 0.03% w/v solution of *guanethidine monosulphate BPCRS* beginning at the words 'add 10 ml of a solution …'. Calculate the content of $C_{10}H_{22}N_4,H_2SO_4$ in the tablets from the absorbances obtained using the declared content of $C_{10}H_{22}N_4,H_2SO_4$ in *guanethidine monosulphate BPCRS*.

STORAGE

Guanethidine Tablets should be protected from light.

Haemodialysis Solutions

General Notices

(Solutions for Haemodialysis, Ph Eur monograph 0128)

Ph Eur

DEFINITION

Solutions for haemodialysis are solutions of electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Because of the large volumes used, haemodialysis solutions are usually prepared by diluting a concentrated solution with water of suitable quality (see the monograph on *Haemodialysis solutions concentrated, water for diluting (1167)*), using for example an automatic dosing device.

CONCENTRATED SOLUTIONS FOR HAEMODIALYSIS

Concentrated haemodialysis solutions are prepared and stored using materials and methods designed to produce solutions having as low a degree of microbial contamination as possible. In certain circumstances, it may be necessary to use sterile solutions.

During dilution and use, precautions are taken to avoid microbial contamination. Diluted solutions are to be used immediately after preparation.

Concentrated solutions for haemodialysis are supplied in:

- — rigid, semi-rigid or flexible plastic containers,
- — glass containers.

Three types of concentrated solutions are used:

1. Concentrated solutions with acetate or lactate

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume the concentrations of the components per litre are usually in the following ranges:

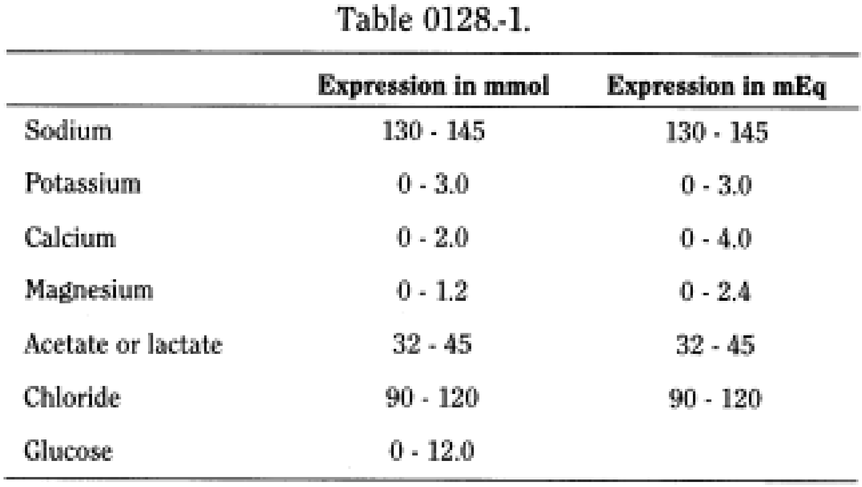


Table 0128.-1.

	Expression in mmol	Expression in mEq
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetate or lactate	32 - 45	32 - 45
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Concentrated solutions with acetate or lactate are diluted before use.

2. Concentrated acidic solutions

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume and before neutralisation with sodium hydrogen carbonate the concentrations of the components per litre are usually in the following ranges:

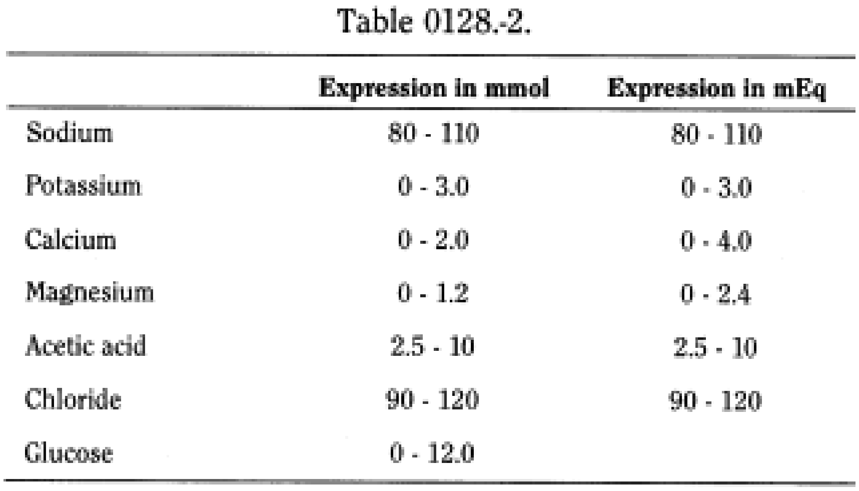

Table 0128.-2.

	Expression in mmol	Expression in mEq
Sodium	80 - 110	80 - 110
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetic acid	2.5 - 10	2.5 - 10
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Sodium hydrogen carbonate must be added immediately before use to a final concentration of not more than 45 mmol/l. The concentrated solution of sodium hydrogen carbonate is supplied in a separate container. The concentrated acidic solutions and the concentrated solutions of sodium hydrogen carbonate are diluted and mixed immediately before use using a suitable device. Alternatively, solid sodium hydrogen carbonate may be used to prepare the solution.

3. Concentrated solutions without buffer

Several formulations of concentrated solutions without buffer are used. The concentrations of the components in the solutions are such that after dilution to the stated volume, the concentrations of the components per litre are usually in the following ranges:

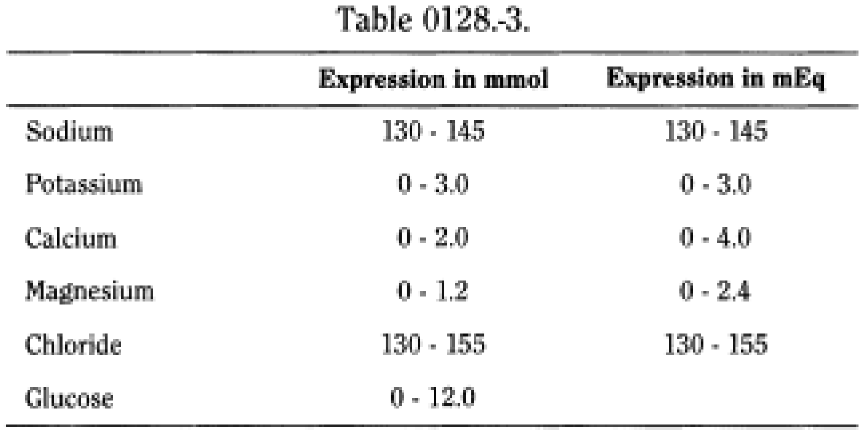

Table 0128.-3.

	Expression in mmol	Expression in mEq
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Chloride	130 - 155	130 - 155
Glucose	0 - 12.0	

Concentrated solutions without buffer are used together with parenteral administration of suitable hydrogen carbonate solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

— potassium: reaction (b);

— calcium: reaction (a);

— sodium: reaction (b);

— chlorides: reaction (a);

— lactates;

— carbonates and hydrogen carbonates;

— acetates:
 — if the solution is free from glucose, use reaction (b),
 — if the solution contains glucose, use the following method: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;

— magnesium: to 0.1 ml of *titan yellow solution R* add 10 ml of water R, 2 ml of the solution to be examined and 1 ml of a 4.2 g/l solution of *sodium hydroxide R*; a pink colour is produced;

— glucose: to 5 ml of the solution to be examined, add 2 ml of *dilute sodium hydroxide solution R* and 0.05 ml of *copper sulphate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution

The solution to be examined is clear *(2.2.1)*. If it does not contain glucose, it is colourless *(2.2.2, Method I)*. If it contains glucose, it is not more intensely coloured than reference solution Y_7 *(2.2.2, Method I)*.

Aluminium *(2.4.17)*

Maximum 0.1 mg/l.

Prescribed solution Take 20 ml of the solution to be examined, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution Mix 1 ml of aluminium *standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R*.

Blank solution Mix 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Extractable Volume *(2.9.17)*

The volume measured is not less than the nominal volume stated on the label.

Sterility *(2.6.1)*

If the label states that the concentrated haemodialysis solution is sterile, it complies with the test for sterility.

Bacterial endotoxins *(2.6.14)*

Less than 0.5 IU/ml in the solution diluted for use.

Pyrogens *(2.6.8)*

Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Dilute the solution to be examined with *water for injections R* to the concentration prescribed for use. Inject 10 ml of the solution per kilogram of the rabbit's mass.

ASSAY

Determine the density (2.2.5) of the concentrated solution and calculate the content in grams per litre and in millimoles per litre.

Sodium

97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry *(2.2.22, Method I)*.

Test solution Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 50.0 ml with *water R*. To 1.0 ml of this solution add 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions Into 4 identical volumetric flasks each containing 10 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 4.0 ml and 5.0 ml of *sodium standard solution (10 ppm Na) R* and dilute to 100.0 ml with *water R*.

Wavelength 589.0 nm.

Potassium

95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Dilute with *water R* an accurately weighed quantity of the solution to be examined to a concentration suitable for the instrument to be used. To 100 ml of this solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Source Potassium hollow-cathode lamp.

Wavelength 766.5 nm.

Atomisation device Air-acetylene flame.

Calcium

95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. To 3.0 ml of this solution add 5 ml of *lanthanum chloride solution R* and dilute to 50.0 ml with *water R*.

Reference solutions Into 4 keep volumetric flasks each containing 5 ml of *lanthanum chloride solution R*, introduce respectively 2.5 ml, 5.0 ml, 7.0 ml and 10.0 ml of *calcium standard solution (10 ppm Ca) R* and dilute to 50.0 ml with *water R*.

Source Calcium hollow-cathode lamp.

Wavelength 422.7 nm.

Atomisation device Air-acetylene flame.

Magnesium

95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. To 2.0 ml of this solution add 5 ml of *lanthanum chloride solution R* and dilute to 50.0 ml with *water R*.

Reference solutions Into 4 identical volumetric flasks each containing 5 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of *magnesium standard solution (10 ppm Mg) R* and dilute to 50.0 ml with *water R*.

Source Magnesium hollow-cathode lamp.

Wavelength 285.2 nm.

Atomisation device Air-acetylene flame.

Total chloride

95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate

95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration *(2.2.20)*, using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate

95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of *0.1 M hydrochloric acid*. Then add 50 ml of *acetonitrile R*. Carry out a potentiometric titration *(2.2.20)*, using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid* a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically *(2.2.20)*.

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

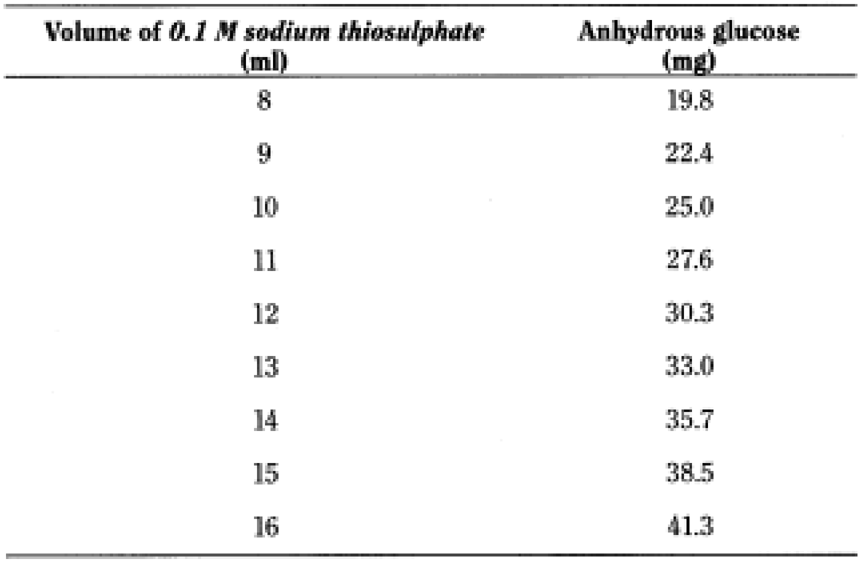
Reducing sugars (expressed as anhydrous glucose)

95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and maintain boiling for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 ml of *water R*.

Calculate the content of reducing sugars, expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0128.-4:

Table 0128.-4.



Volume of *0.1 M sodium thiosulphate* (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not below 4 °C.

LABELLING

The label states:

— the formula of the concentrated solution for haemodialysis expressed in grams per litre and in millimoles per litre,

— the nominal volume of the solution in the container,

— where applicable, that the concentrated solution is sterile,

— the storage conditions,

— that the concentrated solution is to be diluted immediately before use,

— the dilution to be made,

— that the volume taken for use is to be measured accurately,

— the ionic formula for the diluted solution ready for use in millimoles per litre,

— that any unused portion of solution is to be discarded,

— where applicable, that sodium hydrogen carbonate is to be added before use.

Ph Eur

Haemofiltration and Haemodiafiltration Solutions

General Notices

(Solutions for Haemofiltration and for Haemodiafiltration, Ph Eur monograph 0861)

When the solution is intended for haemofiltration only, the title Haemofiltration Solution may be used.

Ph Eur

DEFINITION

Solutions for haemofiltration and for haemodiafiltration are preparations for parenteral use containing electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Solutions for haemofiltration and for haemodiafiltration are supplied in:

— rigid or semi-rigid plastic containers,

— flexible plastic containers inside closed protective envelopes,

— glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral use (*3.2*. *Containers*).

In haemofiltration and haemodiafiltration, the following formulations are used. The concentrations of the components per litre of solution are usually in the following range:

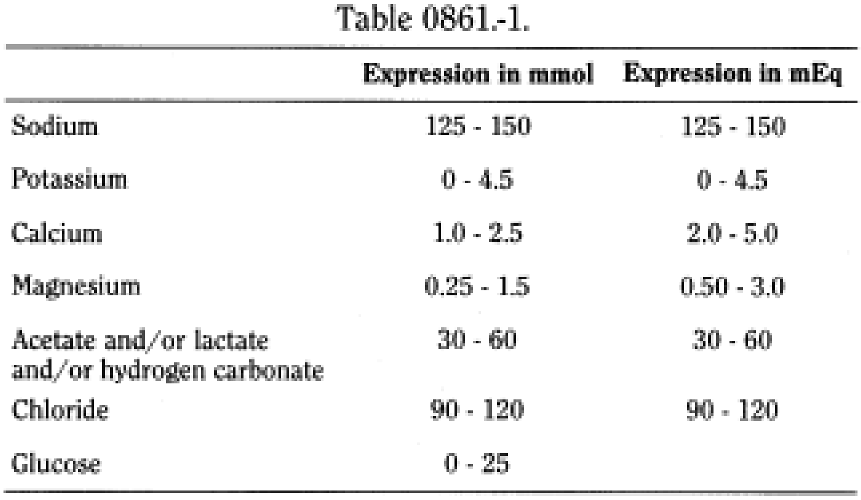


Table 0861.-1.

	Expression in mmol	Expression in mEq
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	1.0 - 2.5	2.0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	0 - 25	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

In haemofiltration and in haemodiafiltration, the following formulations may also be used:

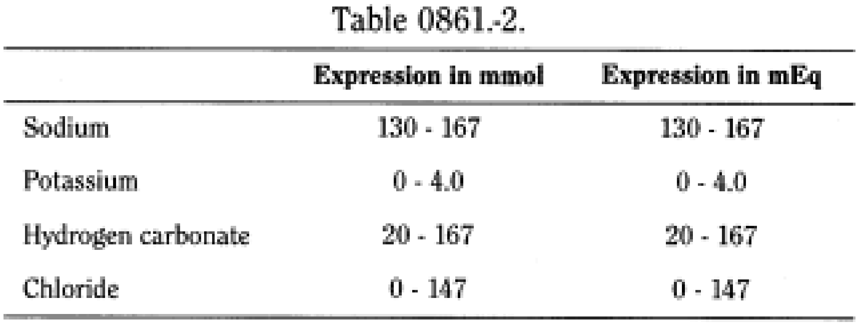

Table 0861.-2.

	Expression in mmol	Expression in mEq
Sodium	130 - 167	130 - 167
Potassium	0 - 4.0	0 - 4.0
Hydrogen carbonate	20 - 167	20 - 167
Chloride	0 - 147	0 - 147

Antioxidants such as metabisulphite salts are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

— potassium: reaction (b);

— calcium: reaction (a);

— sodium: reaction (b);

— chlorides: reaction (a);

— acetates:
  — if the solution is free from glucose, use reaction (b),
  — if the solution contains glucose, use the following method: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;

— lactates;

— carbonates and hydrogen carbonates;

— magnesium: to 0.1 ml of titan yellow solution R add 10 ml of water R, 2 ml of the solution to be examined and 1 ml of 1 M sodium hydroxide; a pink colour is produced;

— glucose: to 5 ml of the solution to be examined, add 2 ml of dilute sodium hydroxide solution R and 0.05 ml of copper sulphate solution R; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution

The solution is clear *(2.2.1)*. If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH *(2.2.3)*

The pH of the solution is 5.0 to 7.5. If the solution contains glucose, the pH is 4.5 to 6.5. If the solution contains hydrogen carbonate, the pH is 7.0 to 8.5.

Hydroxymethylfurfural

To a volume of the solution containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance *(2.2.25)*, determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined. If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R*.

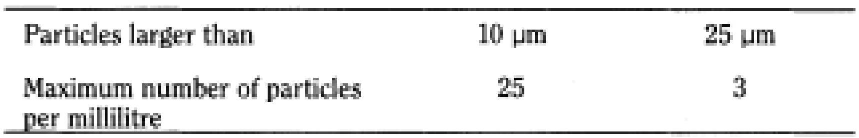
Aluminium *(2.4.17)*

Take 200 ml, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (10 µg/l). Use as the reference solution a mixture of 1 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Particulate contamination

Carry out the test for sub-visible particles (*2.9.19*) using 50 ml of solution.

Table 0861.-3.



Particles larger than	10 µm	25 µm
Maximum number of particles per millilitre	25	3

Extractable Volume *(2.9.17)*

The solution complies with the test prescribed for parenteral infusions.

Sterility *(2.6.1)*

The solution complies with the test for sterility.

Bacterial endotoxins *(2.6.14)*

Less than 0.25 IU/ml.

Pyrogens *(2.6.8)*

Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution.

ASSAY

Sodium

97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method II)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Measure the absorbance at 589.0 nm using a sodium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Potassium

95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 ml of the solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Measure the absorbance at 766.5 nm using a potassium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Calcium

95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Magnesium

95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

Measure the absorbance at 285.2 nm using a magnesium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Total chloride

95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label. Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish--yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate

95.0 per cent to 105.0 per cent of the content of acetate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration *(2.2.20)*, using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate

95.0 per cent to 105.0 per cent of the content of lactate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of *0.1 M hydrochloric acid*. Add 50 ml of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label. Titrate with *0.1 M hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically *(2.2.20)*.

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Lactate and hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of lactates and/or hydrogen carbonates stated on the label. Examine by liquid chromatography *(2.2.29)*.

Test solution Solution to be examined.

Reference solution Dissolve in 100 ml of *water for chromatography R* quantities of lactates and bicarbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations indicated on the label.

The chromatographic procedure may be carried out using:

— a column 0.30 m long and 7.8 mm in internal diameter packed with cation exchange resin R (9 µm),

— as mobile phase at a flow rate of 0.6 ml/min 0.005 M sulphuric acid previously degassed with helium R,

— a differential refractometer detector,

maintaining the temperature of the column at 85 °C.

Inject in duplicate 20 µl of test solution and 20 µl of each reference solution. When the chromatograms are recorded in the prescribed conditions, the peaks elute in the following order: lactates then hydrogen carbonates.

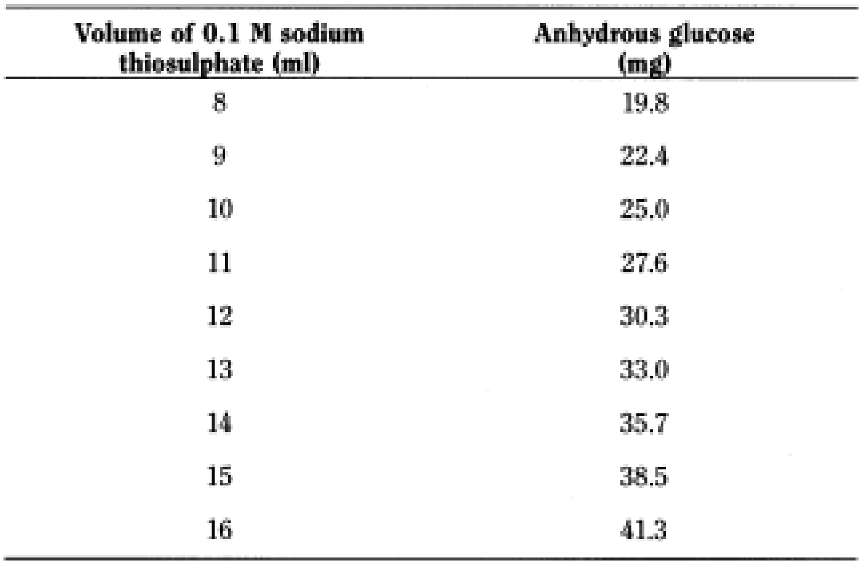
Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

Reducing sugars (expressed as anhydrous glucose)

95.0 per cent to 105.0 per cent of the content of glucose stated on the label. Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate* using *starch solution R*, added towards the end of titration, as indicator. Carry out a blank titration using 25.0 ml of *water R*.

Calculate the content of reducing sugars expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0861.-4:

Table 0861.-4.



Volume of 0.1 M sodium thiosulphate (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not lower than 4 °C.

LABELLING

The label states:

— the formula of the solution for haemofiltration or haemodiafiltration, expressed in grams per litre and in millimoles per litre,

— the calculated osmolarity, expressed in milliosmoles per litre,

— the nominal volume of the solution for haemofiltration or haemodiafiltration in the container,

— that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic,

— the storage conditions,

— that any unused portion of solution is to be discarded.

Halibut-liver Oil Capsules

General Notices

DEFINITION

Halibut-liver Oil Capsules are soft capsules containing Halibut-liver Oil diluted, if necessary, with a suitable fixed oil to a volume of 0.12 to 0.18 ml in each capsule.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of vitamin A

3500 to 4700 IU.

ASSAY

Weigh 10 capsules. Open the capsules carefully without loss of shell material, express as much of the contents as possible and reserve the expressed material. Wash the shells with *ether*, discard the washings, allow the shells to stand at room temperature to constant weight. The difference between the weights represents the weight of the total contents. Determine the content of vitamin A in the reserved portion of the contents by the method described below and calculate the content in a capsule of average content weight.

Carry out the procedures as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper and iron) and acids.

Carry out Method A (ultraviolet absorption spectrophotometry) but if method A is found not to be valid, carry out method B (liquid chromatography).

Method A

To 1 g of the oil being examined in a round-bottomed flask, add 3 ml of a freshly prepared 50% w/w solution of *potassium hydroxide* and 30 ml of *ethanol*, boil under a reflux condenser in a current of *nitrogen* for 30 minutes and cool rapidly. Add 30 ml of *water* and extract with four 50 ml quantities of *ether* and discard the aqueous layer after complete separation of the final extract. Wash the combined ethereal layers with four 50 ml quantities of *water* and evaporate to dryness under a gentle current of *nitrogen* at a temperature not exceeding 30° or in a rotary evaporator at a temperature not exceeding 30° under reduced pressure. Dissolve the residue in sufficient *propan-2-ol R1* to give an expected concentration of vitamin A equivalent to 10 to 15 IU per ml. Measure the *absorbances* of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption, Appendix II B, in a suitable spectrophotometer in 1-cm specially matched cells, using *propan-2-ol R1* in the reference cell.

Calculate the content of vitamin A, as *all-trans*-retinol, in IU per gram from the expression:

$$A_{325} \times \frac{1830}{100m} \times V$$

where A_{325} = absorbance at 325 nm,

m = weight of the oil being examined in grams,

V = total volume of solution containing 10 to 15 IU of vitamin A per ml,

1830 = conversion factor for the specific absorbance of *all-trans*-retinol in IU.

The above expression can be used only if A_{325} has a value of not greater than $A_{325.corr}/0.970$ where $A_{325,corr}$ is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325,\ corr} = 6.815A_{325} - 2.555A_{310} - 4.260A_{324}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325,corr}/0.970$, calculate the content of vitamin A from the expression:

$$A_{325,corr} \times \frac{1830}{100m} \times V$$

The assay is not valid unless the wavelength of maximum absorption lies between 323 nm and 327 nm and the *absorbance* at 300 nm relative to that at 325 nm is at most 0.73.

Method B

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare solution (1) in the following manner. To 2 g of the oil being examined in a round-bottomed flask add 5 ml of a freshly prepared 10% w/v solution of *ascorbic acid* and 10 ml of a freshly prepared 80% w/v solution of *potassium hydroxide* and 100 ml of *ethanol*, boil under a reflux condenser on a water bath for 15 minutes. Add 100 ml of a 1% w/v solution of *sodium chloride* and cool. Transfer the solution to a 500 ml separating funnel rinsing the round-bottomed flask with about 75 ml of a 1% w/v solution of *sodium chloride* and then with 150 ml of a mixture of equal volumes of *light petroleum R3* and *ether R*. Shake for 1 minute and when the layers have separated completely, discard the lower layer and wash the upper layer with 50 ml of a 3% w/v solution of *potassium hydroxide* in a 10% v/v solution of *ethanol* and then with three 50-ml quantities of a 1% w/v solution of *sodium chloride*. Filter the upper layer through 5 g of *anhydrous sodium sulphate* on a fast filter paper into a 250 ml flask suitable for a rotary evaporator. Wash the funnel with 10 ml of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30° under reduced pressure (water ejector) and fill with *nitrogen* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen* at a temperature not exceeding 30°. Dissolve the residue in *propan-2-ol*, transfer to a 25-ml graduated flask and dilute to 25 ml with *propan-2-ol*. Gentle heating with the aid of ultrasound may be required. (A large fraction of the white residue is cholesterol.) Solution (2) is a solution of *retinyl acetate EPCRS* in 2-*propan-2-ol R1* containing about 1000 IU per ml of *all-trans*-retinol. The exact concentration of solution (2) is assessed by *ultraviolet absorption spectrophotometry*, Appendix II B. Dilute the solution with *propan-2-ol R1* to a presumed concentration of 10 to 15 IU per ml and measure the *absorbance* at 326 nm in matched 1-cm cells using *propan-2-ol R1* in the reference cell. Calculate the content of vitamin A in IU per ml of solution (2) from the following expression, taking into account the assigned content of *retinyl acetate EPCRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

where A_{326} = absorbance at 326 nm,

V_2 = volume of the diluted solution,

V_1 = volume of reference solution (a) used,

1900 = conversion factor for the specific absorbance of *retinyl acetate EPCRS* in IU.

Prepare solution (3) in the same manner as solution (1) but using 2 ml of solution (2) in place of the oil being examined. The exact concentration of solution (3) is assessed by *ultraviolet absorption spectrophotometry*, Appendix II B. Dilute solution (3) with *propan-2-ol R1* to a presumed concentration of 10 to 15 IU per ml of *all-trans*-retinol and measure the *absorbance* at 325 nm in matched 1-cm cells using *propan-2-ol R1* in the reference cell. Calculate the content of *all-trans*-retinol in IU per ml of solution (3) from the expression:

$$A_{325} \times \frac{1830 \times V_4}{100 \times V_3}$$

where A_{325} = absorbance at 325 nm,

V_3 = volume of the diluted solution,

V_4 = volume of reference solution (b) used,

1830 = conversion factor for the specific absorbance of *all-trans*-retinol in IU.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm to 10 µm), (b) as mobile phase at a flow rate of 1 ml per minute a mixture of 3 volumes of *water* and 97 volumes of *methanol* and (c) as detector a spectrophotometer set at 325 nm.

Inject in triplicate 10 µl of solutions (1) and (3). The retention time of *all-trans*-retinol is 4 to 6 minutes.

The assay is not valid unless (a) the chromatogram obtained with solution (1) shows a peak corresponding to that of *all-trans*-retinol in the chromatogram obtained with solution (3), (b) when using the method of standard additions to solution (1) there is greater than 95% recovery of the added *retinyl acetate EPCRS* and (c) the recovery of *all-trans*-retinol in solution (3) as assessed by direct absorption spectrophotometry is greater than 95%.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

where A_1 = area of the peak corresponding to *all-trans*-retinol in the chromatogram obtained with solution (1),

A_2 = area of the peak corresponding to *all-trans*-retinol in the chromatogram obtained with solution (3),

C = concentration of *retinyl acetate EPCRS* in solution (2) as assessed before the saponification in International Units per millilitre (1000 IU per ml),

V = volume of solution (2) treated (2 ml),

m = weight of the oil being examined in solution (1) (2 g).

STORAGE

Halibut-liver Oil Capsules should be protected from light and stored at a temperature not exceeding 20°. When stored under these conditions, they may be expected to retain their potency for at least 3 years after the date of preparation.

LABELLING

The label states that each capsule contains 4000 IU (Units) of vitamin A activity.

Haloperidol Capsules

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Capsules contain Haloperidol.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the contents of the capsules containing 10 mg of Haloperidol add 10 ml of *water* and 1 ml of 1M *sodium hydroxide* and extract with 10 ml of *ether*. Filter the ether extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using as the coating substance a suitable silanised silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (Merck silanised silica gel 60 F_{254} plates are suitable) and a mixture of 0.5 volume of 13.5M *ammonia*, 20 volumes of *ammonium acetate solution*, 20 volumes of *water* and 60 volumes of *1,4-dioxan* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 10 mg of Haloperidol with 30 ml of *chloroform*, disperse with the aid of ultrasound for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *chloroform*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *chloroform*. After removal of the plate, dry it in a current of warm air for 15 minutes and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). The test is not valid unless the chromatogram obtained with solution (2) shows a distinct and clearly visible spot.

Uniformity of content

Capsules containing less than 2 mg of Haloperidol comply with the requirements stated under

Capsules using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add sufficient of the mobile phase to the contents of one capsule to produce a solution containing 0.005% w/v of Haloperidol, disperse with the aid of ultrasound for 2 minutes, centrifuge and use the supernatant solution. Solution (2) contains 0.005% w/v of *haloperidol BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) a mixture of 45 volumes of *acetonitrile* and 55 volumes of a 1% w/v solution of *ammonium acetate* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 247 nm.

Calculate the content of $C_{21}H_{23}ClFNO_2$ in each capsule using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Haloperidol Injection

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Injection is a sterile solution of Haloperidol in Lactic Acid diluted with Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 20 mg of Haloperidol add 5 ml of *water* and 1 ml of 1M *sodium hydroxide* and extract with 10 ml of *chloroform*. Filter the chloroform extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 2.8 to 3.6, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 92 volumes of *chloroform*, 8 volumes of *methanol* and 1 volume of 13.5M *ammonia* as the mobile phase. Apply separately to the plate (1) a volume of the injection containing 0.1 mg of Haloperidol, (2) the same volume of a solution prepared by diluting 1 volume of the injection to 100 volumes with *methanol* and (3) the same volume of a solution prepared by diluting 1 volume of the injection to 200 volumes with *methanol*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To a quantity containing 10 mg of Haloperidol add 8 ml of *water* and 10 ml of 1M *hydrochloric acid*. Extract with successive quantities of 25, 25, 10 and 10 ml of *ether*. Wash the combined ether extracts with 10 ml of *water*, combine the aqueous layers and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 ml and dilute 10 ml to 100 ml with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Haloperidol Injection should be protected from light.

Haloperidol Oral Solution

General Notices

Haloperidol Oral Drops

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Oral Solution is an aqueous solution containing not more than 0.2% w/v of Haloperidol.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. To a volume containing 20 mg of Haloperidol add 1 ml of 1M *sodium hydroxide*, extract with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 2.5 to 3.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 92 volumes of *dichloromethane*, 8 volumes of *methanol* and 1 volume of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 50 µl of each of the following solutions. For solution (1) dilute the oral solution if necessary with *methanol* to contain 0.1% w/v of Haloperidol. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *methanol*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To a volume containing 10 mg of Haloperidol add 8 ml of *water* and 10 ml of 1M *hydrochloric acid* and extract with two 10ml quantities of *ether*. Wash the combined ether extracts with 10 ml of *water*, combine the aqueous solutions and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 ml and dilute 10 ml to 100 ml with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Haloperidol Oral Solution should be protected from light. It should not be refrigerated.

When Haloperidol Oral Solution or Haloperidol Oral Drops is prescribed or demanded and no strength is stated, an Oral Solution containing 0.2% w/v of Haloperidol shall be dispensed or supplied.

Haloperidol Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Tablets contain Haloperidol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 10 mg of Haloperidol add 10 ml of *water* and 1 ml of 1M *sodium hydroxide* and extract with 10 ml of *ether*. Filter the ether extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

TESTS

Related substances

Carry out the method described under Haloperidol Capsules applying to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Haloperidol with 10 ml of *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *chloroform*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *chloroform*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). The test is not valid unless the chromatogram obtained with solution (2) shows a distinct and clearly visible spot.

Uniformity of content

Tablets containing less than 2 mg of Haloperidol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.005% w/v of *haloperidol BPCRS* in the mobile phase. For solution (2) place one tablet in 10 ml of the mobile phase, disperse with the aid of ultrasound for 2 minutes and centrifuge. If necessary, dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Haloperidol.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil

ODS is suitable), (b) a mixture of 55 volumes of a 1% w/v solution of *ammonium acetate* and 45 volumes of *acetonitrile* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 247 nm.

Calculate the content of $C_{21}H_{23}ClFNO_2$ using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

ASSAY

For tablets containing 2 mg or more of haloperidol

Weigh and powder 20 tablets and carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.020% w/v of *haloperidol BPCRS* in the mobile phase. For solution (2) add 60 ml of the mobile phase to a quantity of the powdered tablets containing 20 mg of Haloperidol, disperse with the aid of ultrasound for 2 minutes, add sufficient mobile phase to produce 100 ml, mix and filter.

The chromatographic procedure described under Uniformity of content may be used.

Calculate the content of $C_{21}H_{23}ClFNO_2$ using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

For tablets containing less than 2 mg of haloperidol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Heparin Injection

General Notices

Action and use

Anticoagulant.

DEFINITION

Heparin Injection is a sterile solution of Heparin Calcium or Heparin Sodium in Water for Injections. The pH of the solution may be adjusted by the addition of a suitable alkali.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

CHARACTERISTICS

A colourless or straw-coloured liquid, free from turbidity and from matter that deposits on standing.

IDENTIFICATION

A. Under the conditions of the assay, the clotting time is not less than 1.5 times the blank recalcification time.

B. Carry out the method for *zone electrophoresis*, Appendix III F, using *agarose for electrophoresis* as the supporting medium. To equilibrate the agarose and as electrolyte solution use a mixture of 50 ml of *glacial acetic acid* and 800 ml of *water* adjusted to pH 3 by the addition of *lithium hydroxide* and diluted to 1000 ml with *water*. Apply separately to the strip 2 µl to 3 µl of each of the following solutions. For solution (1) dilute a volume of the injection with *water* to give a solution containing 375 IU per ml. For solution (2), dilute *heparin sodium EPBRF* with an equal volume of *water*. Pass a current of 1 mA to 2 mA per centimetre of strip width at a potential difference of 300 volts for about 10 minutes. Stain the strips using a 0.1% w/v solution of *toluidine blue* and remove the excess by washing. The ratio of the distance migrated by the principal band or bands in the gel obtained with solution (1) to the distance migrated by the principal band in the gel obtained with solution (2) is 0.9 to 1.1.

C. When the injection contains Heparin Calcium, it yields reactions A and B characteristic of *calcium salts*, Appendix VI. When the injection contains Heparin Sodium, it yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 5.5 to 8.0, Appendix V L.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C.

For a preparation supplied in a container with a nominal content of less than 100 ml, dilute the injection if necessary with *water BET* to give a solution containing 1000 IU of heparin activity per ml (solution A). The endotoxin limit concentration of solution A is 10 IU of endotoxin per ml. Carry out the test using a lysate with a declared sensitivity not less sensitive than 0.0625 IU of endotoxin per ml and using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

For a preparation supplied in a container with a nominal content of 100 ml or more, the endotoxin limit concentration is 0.25 IU of endotoxin per ml.

For Heparin Injection prepared from Heparin Calcium it may be necessary to add divalent cations in order to achieve the validation criteria.

ASSAY

Carry out the *assay of heparin*, Appendix XIV J. The estimated potency is not less than 90% and not more than 111% of the stated potency. The fiducial limits of error are not less than 80% and not more than 125% of the stated potency.

STORAGE

Heparin Injection should preferably be kept in a container sealed by fusion of the glass.

LABELLING

The strength is stated as the number of IU (Units) in a suitable dose-volume except that for multi-dose containers the strength is stated as the number of IU (Units) per ml.

The label states (1) whether the material is the calcium or sodium salt; (2) when no antimicrobial preservative is present that the preparation contains no antimicrobial preservative and that any portion of the contents not used at once should be discarded.

Hexachlorophene Dusting Powder

General Notices

Zinc and Hexachlorophene Dusting Powder

Action and use

Antiseptic.

DEFINITION

Hexachlorophene Dusting Powder is a *cutaneous powder*. It is a mixture of Hexachlorophene and Zinc Oxide with a suitable inert diluent.

The dusting powder complies with the requirements stated under Topical Powders and with the following requirements.

Content of hexachlorophene, $C_{13}H_6Cl_6O_2$

90.0 to 110.0% of the stated amount.

Content of zinc oxide, ZnO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powder containing 30 mg of Hexachlorophene with 25 ml of *ether* for 15 minutes, filter, wash the filtrate with 10 ml of *water*, dry the ether layer over *anhydrous sodium sulphate*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hexachlorophene *(RS 174)*.

B. Shake a quantity of the powder containing 30 mg of Zinc Oxide with 10 ml of 2M *hydrochloric acid* for 15 minutes and filter. 5 ml of the filtrate yields the reaction characteristic *zinc salts*, Appendix VI.

ASSAY

For hexachlorophene

Shake a quantity of the powder containing 15 mg of Hexachlorophene with 50 ml of *methanolic tris(hydroxymethyl)methylamine solution* for 10 minutes, filter through a sintered-glass crucible (ISO 4793, porosity grade 3, is suitable), wash the filter with two 10 ml quantities of the tris(hydroxymethyl)methylamine solution and dilute the combined filtrate and washings to 100 ml with the same solution. Dilute 10 ml of the resulting solution to 50 ml with *methanolic tris(hydroxymethyl)methylamine solution* and measure the *absorbance* at the maximum at 312 nm, Appendix II B, using in the reference cell a solution prepared by diluting a further 10 ml of the solution to 50 ml with *acidified methanol*. An absorbance of 0.432 is equivalent to 15 mg of $C_{13}H_6Cl_6O_2$ in the weight of powder taken.

For zinc oxide

To a quantity of the powder containing 90 mg of Zinc Oxide add 10 ml of 2M *nitric acid* and 20 ml of *water*, boil for 2 minutes, cool, filter and wash the filter with two 25 ml quantities of *water*. To the combined filtrate and washings add 3 g of *hexamine* and titrate with 0.05M *disodium edetate VS* using 2 ml of *xylenol orange solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 4.068 mg of ZnO.

LABELLING

The label states that the preparation should not be applied to infants or to large areas of skin except in accordance with medical advice.

The label indicates the pharmaceutical form as 'cutaneous powder'.

Homatropine Eye Drops

General Notices

Action and use

Anticholinergic.

DEFINITION

Homatropine Eye Drops are a sterile solution of Homatropine Hydrobromide in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of homatropine hydrobromide, $C_{16}H_{21}NO_3,HBr$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 60 mg of Homatropine Hydrobromide add 3 ml of 5M *ammonia*, extract with 15 ml of *chloroform*, dry the chloroform over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of homatropine *(RS 175)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak derived from homatropine hydrobromide in the chromatogram obtained with solution (1).

C. To 1 ml of the eye drops, diluted with *water* if necessary to give a solution containing 1% w/v of Homatropine Hydrobromide, add 1 ml of 5M *ammonia*, shake with *chloroform* and evaporate the chloroform solution to dryness on a water bath. To the residue add 1.5 ml of a 2% w/v solution of *mercury(II) chloride* in *ethanol (60%)*. A yellow colour is produced which becomes red on gentle warming (distinction from most other alkaloids except atropine and hyoscyamine).

TESTS

Tropine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 33 volumes of *anhydrous formic acid*, 33 volumes of *water* and 134 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) use the eye drops diluted, if necessary, with *water* to contain 1% w/v of Homatropine Hydrobromide. Solution (2) contains 0.0050% w/v of *tropine*. After removal of the plate, dry it at 100° to 105° until the solvent has evaporated, allow to cool and spray with *dilute potassium iodobismuthate solution* until spots appear. Any spot corresponding to tropine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) add 1 ml of a 2% w/v solution of *atropine sulphate BPCRS* (internal standard) in *methanol* (solution A) and 1 ml of 5M *ammonia* to 5 ml of a 0.4% w/v solution of *homatropine hydrobromide BPCRS*. Extract with two 5 ml quantities of *chloroform*, shake the combined extracts with 1 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of *dichloromethane*. To 1 ml of this solution add 0.2 ml of a mixture of 4 volumes of N,O-*bis(trimethylsilyl)acetamide* and 1 volume of *trimethylchlorosilane*, mix and allow to stand for 30 minutes. Prepare solution (2) in the same manner as solution (3) but omitting the addition of solution A. For solution (3) add 1 ml of solution A and 1 ml of 5M *ammonia* to a volume of the eye drops containing 20 mg of Homatropine Hydrobromide, diluted if necessary to 5 ml with *water*, and complete the procedure described under solution (1), beginning at the words 'Extract with two 5-ml quantities of *chloroform*…'.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 220°.

Calculate the content of $C_{16}H_{21}NO_3,HBr$ using the declared content of $C_{16}H_{21}NO_3,HBr$ in *homatropine hydrobromide BPCRS*.

Hyaluronidase Injection

General Notices

Action and use

Used to promote absorption of fluid into tissues.

DEFINITION

Hyaluronidase Injection is a sterile solution of Hyaluronidase in Water for Injections. It is prepared by dissolving Hyaluronidase for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hyaluronidase Injection should be used immediately after preparation.

HYALURONIDASE FOR INJECTION

DEFINITION

Hyaluronidase for Injection is a sterile material consisting of Hyaluronidase with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A solution containing 100 IU in 1 ml of a 0.9% w/v solution of *sodium chloride* depolymerises an equal volume of a 1% w/v solution of *sodium hyaluronate EPBRP* at 20° in 1 minute, as shown by a pronounced decrease in viscosity. This action is destroyed by heating the initial solution at 100° for 30 minutes.

TESTS

Acidity or alkalinity

pH of a 0.3% w/v solution in *carbon dioxide-free water*, 4.5 to 7.5, Appendix V L.

Clarity and colour of solution

A 1.0% w/v solution in *carbon dioxide-free water* is *clear*, Appendix IV A, and not more than faintly yellow.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 150 IU of Hyaluronidase per ml (solution A). The endotoxin limit concentration of solution A is 30 IU per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the Assay described under Hyaluronidase. The estimated potency is not less than 90% and not more than 115% of the stated potency.

LABELLING

The label of the sealed container states (1) the total number of IU (Units) contained in it; (2) that the preparation is not intended for intravenous injection.

Hydralazine Injection

General Notices

Action and use

Vasodilator; treatment of hypertension.

DEFINITION

Hydralazine Injection is a sterile solution of Hydralazine Hydrochloride in Water for Injections. It is prepared by dissolving Hydralazine Hydrochloride for Injection in the requisite amount of Water for Injections immediately before use. For intravenous infusion, the Hydralazine Hydrochloride for Injection should be dissolved in, and then diluted with, an appropriate volume of a suitable diluent.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hydralazine Injection deteriorates on storage and should be used immediately after preparation.

HYDRALAZINE HYDROCHLORIDE FOR INJECTION

DEFINITION

Hydralazine Hydrochloride for Injection is a sterile material consisting of Hydralazine Hydrochloride with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of hydralazine hydrochloride, $C_8H_8N_4,HCl$

98.0 to 114.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydralazine hydrochloride *(RS 177)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.002% w/v solution exhibits four maxima, at 240, 260, 305 and 315 nm.

C. Yield the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH of a 2% w/v solution, 3.5 to 4.2, Appendix V L.

Clarity of solution

A 2.0% w/v solution is not more opalescent than *reference suspension II*, Appendix IV A.

Colour of solution

A 2.0% w/v solution in 0.01M *hydrochloric acid* is not more intensely coloured than *reference solution GY_6*, Appendix IV B, Method II.

Hydrazine

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the upper layer of the mixture obtained by shaking together 80 volumes of *hexane*, 20 volumes of 13.5M *ammonia* and 20 volumes of *ethyl acetate* and allowing to stand. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) dissolve the contents of a sealed container in sufficient 0.1M *methanolic hydrochloric acid* to produce a solution containing 0.5% w/v of Hydralazine Hydrochloride. To 2 ml add 1 ml of a 2% w/v solution of *salicylaldehyde* in *methanol* and 0.1 ml of *hydrochloric acid*, centrifuge and decant the supernatant liquid. Prepare solution (2) in the same manner, but use 2 ml of a 0.00025% w/v solution of *hydrazine sulphate* in 0.1M *methanolic hydrochloric acid* in place of the solution of the material being examined. After removal of the plate, allow it to dry in air and spray with *dimethylaminobenzaldehyde solution R1*. Any spot corresponding to hydrazine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content

Sealed containers each containing 20 mg or less of Hydralazine Hydrochloride comply with the requirements stated under Parenteral Preparations, Powders for Injections using the following method of analysis. Dissolve the contents of a sealed container in sufficient *water* to produce 100 ml and dilute a volume containing 1 mg of Hydralazine Hydrochloride to 100 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 260 nm, Appendix II B. Calculate the content of $C_8H_8N_4$,HCl taking 535 as the value of A(1%, 1 cm) at the maximum at 260 nm.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations, Powders for Injections.

Dissolve 0.1 g of the mixed contents of the 10 containers in a mixture of 25 ml of *water* and 35 ml of *hydrochloric acid* and titrate with 0.025M *potassium iodate VS* determining the end point potentiometrically using a platinum indicator electrode and a calomel reference electrode. Each ml of 0.025M *potassium iodate VS* is equivalent to 4.916 mg of $C_8H_8N_4$,HCl. Calculate the content of $C_8H_8N_4$,HCl in a container of average content weight.

STORAGE

The sealed container should be protected from light.

LABELLING

The label of the sealed container states that solutions containing glucose should not be used in the preparation of the intravenous infusion.

Hydralazine Tablets

General Notices

Action and use

Vasodilator; treatment of hypertension.

DEFINITION

Hydralazine Tablets contain Hydralazine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydralazine hydrochloride, $C_8H_8N_4,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Hydralazine Hydrochloride in 10 ml of *water*, make alkaline with 2 ml of 5M *ammonia* and extract with two 10-ml quantities of *chloroform*. Combine the chloroform extracts and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hydralazine *(RS 176)*.

B. Shake a quantity of the powdered tablets containing 25 mg of Hydralazine Hydrochloride with 30 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 50 ml and filter. Dilute 1 volume of the filtrate to 50 volumes with *water*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits four maxima, at 240, 260, 305 and 315 nm.

C. Extract a quantity of the powdered tablets containing 0.1 g of Hydralazine Hydrochloride with two 25-ml quantities of *methanol*, filter the combined extracts and evaporate to dryness. To 5 ml of a 1% w/v solution of the residue in *methanol* add 5 ml of a 2% w/v solution of *2-nitrobenzaldehyde* in *ethanol (96%)*. An orange precipitate is produced.

TEST

Hydrazine

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the upper layer obtained by shaking together 20 volumes of 13.5M *ammonia*, 20 volumes of *ethyl acetate* and 80 volumes of *hexane* and allowing to separate. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 50 mg of Hydralazine Hydrochloride with 10 ml of 0.1M *methanolic hydrochloric acid*; to 2 ml add 1 ml of a 2% w/v solution of *salicylaldehyde* in *methanol* and 0.1 ml of *hydrochloric acid*, centrifuge and use the supernatant liquid. Prepare solution (2) in the same manner, but using 2 ml of a 0.00025% w/v solution of *hydrazine sulphate* in 0.1M *methanolic hydrochloric acid* in place of the solution of the substance being examined. After removal of the plate, allow it to dry in air and spray with *dimethylaminobenzaldehyde solution R1*. Any spot corresponding to hydrazine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 50 mg of Hydralazine Hydrochloride add 50 ml of *water* and shake for 20 minutes. Add 60 ml of *hydrochloric acid* and titrate with 0.025M *potassium iodate VS* determining the end point potentiometrically using platinum and calomel electrodes. Each ml of 0.025M *potassium iodate VS* is equivalent to 4.916 mg of $C_8H_8N_4$,HCl.

STORAGE

Hydralazine Tablets should be protected from light.

Hydrochlorothiazide Tablets

General Notices

Action and use

Thiazide diuretic.

DEFINITION

Hydrochlorothiazide Tablets contain Hydrochlorothiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) triturate a quantity of the powdered tablets containing 10 mg of Hydrochlorothiazide with 10 ml of *acetone* and filter. Solution (2) contains 0.1% w/v of *hydrochlorothiazide EPCRS* in *acetone*. After removal of the plate, dry it in a current of air, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again. By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TESTS

Related substances

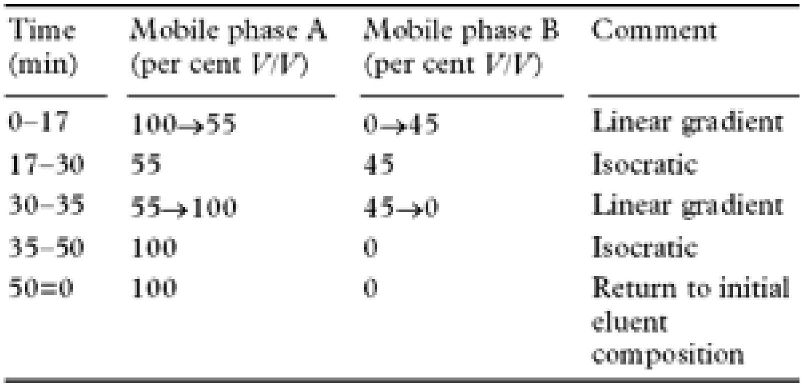
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Hydrochlorothiazide with 25 ml of a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 100 ml with *phosphate buffer solution pH 3.2 R1*. Filter through a glass-fibre filter (Whatman 0.45µ GD/X is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture containing 1 volume of *methanol*, 1 volume of *acetonitrile* and 2 volumes of *phosphate buffer solution pH 3.2 R1.* For solution (3) dissolve, with the aid of ultrasound, 15 mg each of *hydrochlorothiazide EPCRS* and *chlorothiazide EPCRS* in 25 ml of a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 100 ml with *phosphate buffer solution pH 3.2 R1*. Dilute 5 volumes of this solution to 100 volumes with the same solvent mixture.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenosphere ODS 3µ or Microsorb ODS 3µ is suitable), (b) as the mobile phase with a flow rate of 0.8 ml per minute the changing proportions of mobile phase A and mobile phase B described below and (c) a detection wavelength of 224 nm.

Mobile phase A A mixture of 10 volumes of *tetrahydrofuran*, 60 volumes of *methanol* and 940 volumes of *phosphate buffer solution pH 3.2 R1*.

Mobile phase B A mixture of 50 volumes of *tetrahydrofuran*, 500 volumes of *methanol* and 500 volumes of *phosphate buffer solution pH 3.2 R1*.

Equilibrate the column for at least 20 minutes with mobile phase A. Inject 20 µl. Carry out a linear gradient elution using the following gradient programme.



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0–17	100→55	0→45	Linear gradient
17–30	55	45	Isocratic
30–35	55→100	45→0	Linear gradient
35–50	100	0	Isocratic
50=0	100	0	Return to initial eluent composition

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chlorothiazide and hydrochlorothiazide is at least 2.5. If necessary, adjust the composition of the mobile phase or the time programme of the linear gradient.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 30 mg of Hydrochlorothiazide add 50 ml of 0.1M *sodium hydroxide*, shake for 20 minutes and dilute to 100 ml with 0.1M *sodium hydroxide*. Mix, filter, dilute 5 ml of the filtrate to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_7H_8ClN_3O_4S_2$ taking 520 as the value of A(1%, 1 cm) at the maximum at 273 nm.

Hydrocortisone Acetate and Neomycin Ear Drops

General Notices

Hydrocortisone and Neomycin Ear Drops

Action and use

Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone Acetate and Neomycin Ear Drops are a suspension of Hydrocortisone Acetate in a solution of Neomycin Sulphate in Purified Water.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

90.0 to 110.0% w/v of the stated amount.

IDENTIFICATION

A. Comply with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 ml of *chloroform* to a quantity of the ear drops containing 5 mg of Hydrocortisone Acetate in a separating funnel, shake for 2 to 3 minutes and allow the layers to separate. Filter if necessary and use the chloroform layer. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in *chloroform*.

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Comply with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulphate with *water* to 2.5 ml, shake with 3 ml of *chloroform*, centrifuge and use the clear, upper layer.

TESTS

Acidity or alkalinity

pH, 6.5 to 8.0, Appendix V L.

Neamine

Comply with the test described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulphate with 2.5 ml of *water*, shake gently with 3 ml of *chloroform*, centrifuge and use the aqueous layer.

Neomycin C

Comply with the test described under Hydrocortisone and Neomycin Cream but using as solution (2) a solution prepared in the following manner. Dilute the ear drops with 0.02M *sodium tetraborate* to contain 700 IU per ml. To 0.5 ml of the resulting solution add 1.5 ml of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat in a water bath at 60° for 1 hour, cool and dilute the solution to 25 ml with the mobile phase; allow to stand and use the clear, lower layer.

ASSAY

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.020% w/v of *hydrocortisone acetate BPCRS* and 0.016% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the ear drops containing 10 mg of Hydrocortisone Acetate with 25 ml of a 0.032% w/v solution of *fluoxymesterone BPCRS* in *chloroform*, add 25 ml of *chloroform*, mix and filter through *anhydrous sodium sulphate*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the ear drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulphate

Dilute a volume containing 3500 IU to 50 ml with sterile *phosphate buffer pH 8.0*, dilute 10 ml of the resulting solution to 100 ml with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per ml.

LABELLING

The strength with respect to Neomycin Sulphate is stated as the number of IU (Units) per ml.

Hydrocortisone Acetate and Neomycin Eye Drops

General Notices

Hydrocortisone and Neomycin Eye Drops

Action and use

Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone Acetate and Neomycin Eye Drops are a sterile suspension of Hydrocortisone Acetate in a solution of Neomycin Sulphate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

90.0 to 110.0% w/v of the stated amount.

IDENTIFICATION

A. Comply with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 ml of *chloroform* to a quantity of the eye drops containing 5 mg of Hydrocortisone Acetate in a separating funnel, shake for 2 to 3 minutes and allow the layers to separate. Filter if necessary and use the chloroform layer. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in *chloroform*.

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Comply with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulphate with *water* to 2.5 ml, shake with 3 ml of *chloroform*, centrifuge and use the clear, upper layer.

TESTS

Acidity or alkalinity

pH, 6.5 to 8.0, Appendix V L.

Neamine

Comply with the test described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulphate with 2.5 ml of *water*, shake gently with 3 ml of *chloroform*, centrifuge and use the aqueous layer.

Neomycin C

Comply with the test described under Hydrocortisone and Neomycin Cream but using as solution (2) a solution prepared in the following manner. Dilute the eye drops with 0.02M *sodium tetraborate* to contain 700 IU per ml. To 0.5 ml of the resulting solution add 1.5 ml of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat in a water bath at 60° for 1 hour, cool and dilute the solution to 25 ml with the mobile phase; allow to stand and use the clear, lower layer.

ASSAY

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.020% w/v of *hydrocortisone acetate BPCRS* and 0.016% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the eye drops containing 10 mg of Hydrocortisone Acetate with 25 ml of a 0.032% w/v solution of *fluoxymesterone BPCRS* in *chloroform*, add 25 ml of *chloroform*, mix and filter through *anhydrous sodium sulphate*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the eye drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulphate

Dilute a volume containing 3500 IU to 50 ml with sterile *phosphate buffer pH 8.0*, dilute 10 ml of the resulting solution to 100 ml with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per ml.

LABELLING

The strength with respect to Neomycin Sulphate is stated as the number of IU (Units) per ml.

Hydrocortisone Acetate and Neomycin Eye Ointment

General Notices

Action and use

Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone Acetate and Neomycin Eye Ointment is a sterile preparation containing Hydrocortisone Acetate and Neomycin Sulphate in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Complies with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 ml of *hexane* saturated with *acetonitrile* to a quantity of the ointment containing 5 mg of Hydrocortisone Acetate and shake for 2 to 3 minutes. Add 10 ml of *acetonitrile* saturated with *hexane*, shake for 10 minutes and allow the layers to separate. Centrifuge, filter the acetonitrile layer if necessary, evaporate 5 ml to dryness and dissolve the residue in 5 ml of a mixture of equal volumes of *chloroform* and *ethanol (96%)*. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in a mixture of equal volumes of *chloroform* and *ethanol (96%)*.

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Complies with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) shake a quantity containing 7000 IU of Neomycin Sulphate with 10 ml of *chloroform*, add 5 ml of *water*, shake, centrifuge and use the clear, upper layer.

TESTS

Neamine

Complies with the test described under Hydrocortisone and Neomycin Cream. For solution (1) disperse a quantity containing 7000 IU of Neomycin Sulphate in 10 ml of *chloroform*, shake gently with 5 ml of *water*, centrifuge and use the aqueous layer.

Neomycin C

Complies with the test described under Hydrocortisone and Neomycin Cream.

ASSAY

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.025% w/v of *hydrocortisone acetate BPCRS* and 0.050% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the ointment containing 25 mg of Hydrocortisone Acetate with 20 ml of a 0.25% w/v solution of *fluoxymesterone BPCRS* in *chloroform* and several glass beads for 30 minutes. Centrifuge; to 10 ml of the clear, supernatant layer add sufficient *chloroform* to produce 50 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the ointment using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulphate

Dissolve a quantity containing 3500 IU in 50 ml of *ether*, extract the solution with three 30-ml quantities of sterile *phosphate buffer pH 8.0* and discard the ether phase. Pass *nitrogen* through the combined aqueous extracts to remove dissolved ether, dilute to 100 ml with sterile *phosphate buffer pH 8.0* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per g.

LABELLING

The strength with respect to Neomycin Sulphate is stated as the number of IU (Units) per g.

Hydrocortisone Acetate Cream

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Acetate Cream contains Hydrocortisone Acetate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone Acetate, prepare two solutions in the following manner. For solution (1) mix a quantity of the cream containing 25 mg of Hydrocortisone Acetate with 10 ml of *methanol (90%)*, add 50 ml of hot *hexane* and shake. Discard the upper layer, add 5 g of *anhydrous sodium sulphate* to the lower layer, mix and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) is a mixture of equal volumes of solution (1) and a 0.25% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

For creams containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solution (1) in the same manner as solution (1) described above but using a quantity of the cream containing 5 mg of Hydrocortisone Acetate. Solution (2) is a mixture of equal volumes of solution (1) and a 0.05% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2), which appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 25 mg of *hydrocortisone acetate BPCRS* in 45 ml of *methanol*, add 5 ml of a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* and add sufficient *water* to produce 100 ml. For solution (2) disperse, by shaking, a quantity containing 25 mg of Hydrocortisone Acetate in 40 ml of a solution prepared by mixing 75 ml of *methanol* with 25 ml of a 15% w/v solution of *sodium chloride*. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using two 10 ml quantities of the methanolic sodium chloride solution. Add 5 ml of *methanol* to the combined extracts and sufficient *water* to produce 100 ml, mix and filter through a glass microfibre filter paper (Whatman GF/C is suitable).

For creams containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 5 mg of *hydrocortisone acetate BPCRS* in 45 ml of *methanol* and add 5 ml of a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* and sufficient *water* to produce 100 ml. Prepare solution (2) in the same manner as solution (2) above but use a quantity containing 5 mg of Hydrocortisone Acetate.

For all creams prepare solution (3) in the same manner as solution (2) but adding 5 ml of the appropriate internal standard solution in place of the 5 ml of methanol before diluting to volume.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the preparation being examined using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

Hydrocortisone Acetate Injection

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Acetate Injection is a sterile suspension of Hydrocortisone Acetate in Water for Injections. It is prepared using aseptic technique.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A white suspension that settles on standing but readily disperses on shaking. On examination under a microscope, the particles are seen to be crystalline and rarely exceed 30 µm in diameter.

IDENTIFICATION

Filter a volume containing 50 mg of Hydrocortisone Acetate through a sintered-glass filter, wash the residue with four 5-ml quantities of *water*, dissolve in 20 ml of *chloroform*, wash the chloroform solution with four 10-ml quantities of *water*, discard the washings, filter the chloroform solution through absorbent cotton and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydrocortisone acetate *(RS 179)*.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase B*.

C. Yields the reaction characteristic of *acetyl groups*, Appendix VI.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 25 mg of *hydrocortisone acetate BPCRS* in 50 ml of *methanol* and add sufficient *water* to produce 100 ml. For solution (2) add 70 ml of *methanol* to a volume of the injection containing 50 mg of Hydrocortisone Acetate, shake to produce a clear solution and dilute to 100 ml with *methanol*. Dilute 10 ml of the resulting solution to 20 ml with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the preparation being examined using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Hydrocortisone Acetate Injection should be protected from light.

LABELLING

The label states (1) that it is intended for local action; (2) that the container should be gently shaken before a dose is withdrawn.

Hydrocortisone Acetate Ointment

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Acetate Ointment contains Hydrocortisone Acetate in a suitable basis.
The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions.

For ointments containing more than 0.5% w/w of Hydrocortisone Acetate, prepare two solutions in the following manner. For solution (1) disperse a quantity containing 25 mg of Hydrocortisone Acetate in 5 ml of hot *hexane*, cool, extract with 10 ml of *methanol (90%)* and filter. Solution (2) is a mixture of equal volumes of solution (1) and a 0.25% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

For ointments containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solution (1) in the same manner as solution (1) above but use a quantity containing 5 mg of Hydrocortisone Acetate. Solution (2) is a mixture of equal volumes of solution (1) and a 0.05% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) which appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For ointments containing more than 0.5% w/w of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 25 mg of *hydrocortisone acetate BPCRS* in 45 ml of *methanol*, add 5 ml of a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* and sufficient *water* to produce 100 ml. For solution (2) disperse a quantity of the ointment containing 25 mg of Hydrocortisone Acetate in 100 ml of hot *hexane*, cool and extract with 20 ml of a solution prepared by mixing 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Repeat the extraction using two 10 ml quantities of the methanolic sodium chloride solution. Add 5 ml of *methanol* to the combined extracts and sufficient *water* to produce 100 ml, mix and filter through a glass microfibre filter (Whatman GF/C is suitable).

For ointments containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 5 mg of *hydrocortisone acetate BPCRS* in 45 ml of *methanol*, add 5 ml of a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* and add sufficient *water* to produce 100 ml. Prepare solution (2) in the same manner as solution (2) above but use a quantity containing 5 mg of Hydrocortisone Acetate.

In each case prepare solution (3) in the same manner as solution (2) but add 5 ml of the internal standard solution in place of the 5 ml of methanol before diluting to volume.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the ointment using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Hydrocortisone Acetate Ointment should be protected from light.

Hydrocortisone and Clioquinol Cream

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone and Clioquinol Cream contains Hydrocortisone and Clioquinol, the latter in *very fine powder*, in a suitable basis.
The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

Content of clioquinol, C_9H_5ClINO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) disperse, by warming and shaking, a quantity of the cream containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (96%)*, cool, allow to stand at 0° for 30 minutes, filter and use the filtrate. Solution (2) contains 0.25% w/v of *hydrocortisone BPCRS* in *ethanol (96%)*. For solution (3) dissolve 12.5 mg of *hydrocortisone BPCRS* in 5 ml of solution (1). After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution.* The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay for hydrocortisone, the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

C. Fuse a quantity of the cream containing 0.1 g of Clioquinol with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with 2M *nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in 5M *ammonia*. Add 5M *ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with 2M *nitric acid*; a white precipitate is produced which darkens on exposure to light.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 5 mg of *hydrocortisone BPCRS* in 5 ml of a 4% v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80%)*. For solution (2) add 30 ml of *2,2,4-trimethylpentane* to a quantity of the cream containing 10 mg of Hydrocortisone and warm on a water bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80%)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent. Prepare solution (3) in the same manner as solution (2) but adding 10 ml of a 4% v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (65%)* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 242 nm.

Calculate the content of $C_{21}H_{30}O_5$ in the cream using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For clioquinol

To a quantity of the cream containing 25 mg of Clioquinol add 80 ml of a hot mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* and heat on a water bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with the aqueous methoxyethanol, mix and filter. To 10 ml of the filtrate add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the *absorbance* of the resulting solution at the maximum at 650 nm, Appendix II B, using in the reference cell a solution prepared by treating 10 ml of the aqueous methoxyethanol in the same manner beginning at the words 'add 10 ml of *2-methoxyethanol* …'.

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* …' using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol BPCRS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml. Calculate the content of C_9H_5ClINO from the *absorbances* obtained using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Hydrocortisone and Clioquinol Cream should be protected from light.

Hydrocortisone and Clioquinol Ointment

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone and Clioquinol Ointment contains Hydrocortisone and Clioquinol, the latter in *very fine powder*, in a suitable basis.
The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

Content of clioquinol, C_9H_5ClINO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) disperse, by warming and shaking, a quantity of the ointment containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (96%)*, cool, allow to stand at 0 ^{c} for 30 minutes, filter and use the filtrate. Solution (2) contains 0.25% w/v of *hydrocortisone BPCRS* in *ethanol (96%)*. For solution (3) dissolve 12.5 mg of *hydrocortisone BPCRS* in 5 ml of solution (1). After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution.* The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay for hydrocortisone the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

C. Fuse a quantity of the ointment containing 0.1 g of Clioquinol with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with 2M *nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in 5M *ammonia*. Add 5M *ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with 2M *nitric acid*; a white precipitate is produced which darkens on exposure to light.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 5 mg of *hydrocortisone BPCRS* in 5 ml of a 4% v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80%)*. For solution (2) add 30 ml of *2,2,4-trimethylpentane* to a quantity of the ointment containing 10 mg of Hydrocortisone and warm on a water bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80%)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent. Prepare solution (3) in the same manner as solution (2) but adding 10 ml of a 4% v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (Spherisorb ODS 1 is suitable), (b) *methanol (65%)* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 242 nm.

Calculate the content of $C_{21}H_{30}O_5$ in the ointment using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For clioquinol

To a quantity containing 25 mg of Clioquinol add 80 ml of a hot mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* and heat on a water bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with the aqueous methoxyethanol, mix and filter. To 10 ml of the filtrate add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the *absorbance* of the resulting solution at the maximum at 650 nm, Appendix II B, using in the reference cell a solution prepared by treating 10 ml of the aqueous methoxyethanol in the same manner beginning at the words 'add 10 ml of *2-methoxyethanol* …'.

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* …' using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol BPCRS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml. Calculate the content of C_9H_5ClINO from the *absorbances* obtained using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Hydrocortisone and Clioquinol Ointment should be protected from light.

Hydrocortisone and Neomycin Cream

General Notices

Action and use

Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone and Neomycin Cream contains Hydrocortisone and Neomycin Sulphate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 90 volumes of *dichloromethane* and 8 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add 10 ml of *hexane* saturated with *acetonitrile* to a quantity of the preparation being examined containing 5 mg of Hydrocortisone and shake for 2 to 3 minutes. Add 10 ml of *acetonitrile* saturated with *hexane*, shake for 10 minutes and allow the layers to separate. Centrifuge, filter the acetonitrile layer if necessary, evaporate 5 ml to dryness and dissolve the residue in 5 ml of a mixture of equal volumes of *chloroform* and *ethanol (96%)*. Solution (2) contains 0.05% w/v of *hydrocortisone BPCRS* in a mixture of equal volumes of *chloroform* and *ethanol (96%)*. After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) .

B. In the Assay for hydrocortisone the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 60 volumes of *methanol*, 40 volumes of 13.5M *ammonia* and 20 volumes of *chloroform* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) disperse a quantity containing 7000 IU of Neomycin Sulphate with 10 ml of *chloroform*, add 5 ml of *water*, shake, centrifuge and use the clear, upper layer. Solution (2) contains 0.2% w/v of *neomycin sulphate EPCRS* in *water*. After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Neamine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a freshly prepared 3.85% w/v solution of *ammonium acetate* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dissolve a quantity containing 7000 IU of Neomycin Sulphate in 10 ml of *chloroform*, shake gently with 5 ml of *water*, centrifuge and use the aqueous layer. Solution (2) contains 0.004% w/v of *neamine EPCRS* in *water*. After removal of the plate, dry it in a current of warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution* with *water* to contain 0.5% of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives at most a very faint blue colour with a drop of a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to the cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. Any spot corresponding to neamine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Neomycin C

Carry out the method for *liquid chromatography*, Appendix III D, injecting 10 µl of each of the following solutions. For solution (1) add 1.5 ml of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol* to 0.5 ml of a 0.10% w/v solution of *neomycin sulphate EPCRS* in 0.02M *sodium tetraborate*, heat in a water bath at 60° for 1 hour and cool; dilute the solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer. For solution (2) shake a quantity containing 3500 IU of Neomycin Sulphate with 10 ml of *chloroform*, add 5 ml of 0.02M *sodium tetraborate*, mix, allow to separate and centrifuge the upper layer. Proceed as for solution (1) but using 0.5 ml of the clear supernatant liquid in place of 0.5 ml of the neomycin sulphate solution.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Nucleosil 100-5 is suitable), (b) as the mobile phase with a flow rate of 1.6 ml per minute a solution prepared by mixing 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* with sufficient of a 2.0% v/v solution of *absolute ethanol* in *ethanol-free chloroform* to produce 250 ml and (c) a detection wavelength of 350 nm. Pass the mobile phase through the column for several hours before starting the analysis. Record the chromatogram for 1.4 times the retention time of the peak due to neomycin B.

The chromatogram obtained with solution (1) shows a principal peak due to neomycin B and a major *secondary peak* due to neomycin C with a retention time relative to neomycin B of about 0.6.

The *column efficiency*, determined using the peak due to neomycin B in the chromatogram obtained with solution (1), should be at least 13,000 *theoretical plates* per metre.

In the chromatogram obtained with solution (2) the area of the peak corresponding to neomycin C is 3 to 15% of the sum of the areas of the peaks corresponding to neomycin B and neomycin C.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.010% w/v of *hydrocortisone BPCRS* and 0.018% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake together a quantity of the preparation being examined containing 25 mg of Hydrocortisone, several small glass beads and 25 ml of a 0.036% w/v solution of *fluoxymesterone BPCRS* in *chloroform* for 15 minutes, add sufficient *chloroform* to produce 50 ml, mix and centrifuge. Remove any excipient material present at the interface and use the clear supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{21}H_{30}O_5$ in the cream using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For neomycin sulphate

Stir a quantity containing 4200 IU with 15 ml of *chloroform* until the emulsion is completely broken. Transfer to a separating funnel with 25 ml of *phosphate buffer pH 8.0* and 5 ml of *chloroform*, shake vigorously, allow to separate and reserve the aqueous phase. Extract the chloroform layer with two 25-ml quantities of *phosphate buffer pH 8.0* and discard the chloroform layer. Pass *nitrogen* through the combined aqueous solutions to remove dissolved chloroform and dilute to 100 ml with sterile *phosphate buffer pH 8.0*. Dilute 10 ml of the resulting solution to 50 ml with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated amount.

LABELLING

The strength with respect to Neomycin Sulphate is stated as the number of IU (Units) per g.

Hydrocortisone Cream

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Cream contains Hydrocortisone in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone, prepare three solutions in the following manner. For solution (1) mix a quantity containing 25 mg of Hydrocortisone with 10 ml of *methanol (90%)*, add 50 ml of hot *hexane* and shake. Separate the lower layer, add 5 g of *anhydrous sodium sulphate*, mix and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) contains 0.25% w/v of *hydrocortisone BPCRS* in *methanol*. Solution (3) is a mixture of equal volumes of solutions (1) and (2).

For creams containing 0.5% w/w or less of Hydrocortisone, prepare solution (1) in the same manner as solution (1) above but use a quantity containing 5 mg of Hydrocortisone. Solution (2) contains 0.05% w/v of *hydrocortisone BPCRS* in *methanol*. Solution (3) is a mixture of equal volumes of solutions (1) and (2).

After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2); if it does not, the principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 25 mg of *hydrocortisone BPCRS* in 45 ml of *methanol*, add 5 ml of a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* and add sufficient *water* to produce 100 ml. For solution (2) disperse, by shaking, a quantity of the cream containing 25 mg of Hydrocortisone in 40 ml of a mixture of 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Add 50 ml of hot *hexane*, shake and separate the lower layer. Repeat the extraction using a further two 10-ml quantities of the methanolic sodium chloride solution. To the combined extracts add 5 ml of *methanol* and sufficient *water* to produce 100 ml, mix and filter through a glass microfibre paper (Whatman GF/C is suitable).

For creams containing 0.5% or less of Hydrocortisone, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 5 mg of *hydrocortisone BPCRS* in 45 ml of *methanol* and add 5 ml of a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* and sufficient *water* to produce 100 ml. Prepare solution (2) in the same manner as solution (2) above but use a quantity of the cream containing 5 mg of Hydrocortisone.

For all preparations prepare solution (3) in the same manner as solution (2) but add 5 ml of the appropriate internal standard solution in place of the 5 ml of methanol before diluting to volume.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{21}H_{30}O_5$ in the preparation being examined using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

Hydrocortisone Ointment

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Ointment contains Hydrocortisone in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Complies with test A for Identification described under Hydrocortisone Cream but preparing solution (1) in the following manner. For ointments containing more than 0.5% w/w of Hydrocortisone, disperse a quantity containing 25 mg of Hydrocortisone in 5 ml of hot *hexane*, cool, extract with 10 ml of *methanol (90%)* and filter. For ointments containing 0.5% w/w or less of Hydrocortisone, disperse a quantity containing 5 mg of Hydrocortisone in 50 ml of hot *hexane*, cool, extract with 10 ml of *methanol (90%)* and filter.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

ASSAY

Carry out the Assay described under Hydrocortisone Cream but prepare solution (2) in the following manner. For ointments containing more than 0.5% w/w of Hydrocortisone, disperse a quantity containing 25 mg of Hydrocortisone in 100 ml of hot *hexane*, cool and extract with 20 ml of a solution prepared by mixing 3 volumes of *methanol* with 1 volume of a 15% w/v solution of *sodium chloride*. Repeat the extraction using a further two 10 ml quantities of the methanolic sodium chloride solution. To the combined extracts add 5 ml of *methanol* and sufficient *water* to produce 100 ml, mix and filter through a glass microfibre filter (Whatman GF/C is suitable). For ointments containing 0.5% w/w or less of Hydrocortisone, prepare solution (2) in the same manner as solution (2) above but use a quantity containing 5 mg of Hydrocortisone.

STORAGE

Hydrocortisone Ointment should be protected from light.

Hydrocortisone Oromucosal Tablets

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Oromucosal Tablets are mucoadhesive buccal tablets containing hydrocortisone sodium succinate prepared by buffering Hydrocortisone Hydrogen Succinate.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the tablets containing the equivalent of 25 mg of hydrocortisone with 10 ml of *methanol*, filter and use the filtrate. For solution (2) dissolve 50 mg of *hydrocortisone acetate BPCRS* in sufficient *methanol* to produce 20 ml. Solution (3) contains equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air, spray with *ethanolic sulphuric acid (20%)*, heat at 120° for 10 minutes, allow to cool and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows a single compact spot.

TESTS

Disintegration

The tablets disintegrate in not less than 10 minutes when examined by the *disintegration test for tablets and capsules*, Appendix XII A1, but using *water* at 24° to 26°.

Free hydrocortisone

Not more than 15% of the stated amount when determined by the following method. Weigh and powder 20 tablets. For solution (1) disperse a quantity of the powdered tablets containing the equivalent of 7.5 mg of hydrocortisone in 15 ml of a phosphate buffer prepared by dissolving 5.8 g of *anhydrous disodium hydrogen orthophosphate* and 1.6 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water* and adjusting the pH to 7.4, if necessary, by adding 10 mg quantities of either *anhydrous disodium hydrogen orthophosphate* or *sodium dihydrogen orthophosphate*. Shake and extract with three 25-ml quantities of *chloroform*, combine the extracts in a second separating funnel, wash the combined extracts with 2 ml of *water*, filter the chloroform layer through a plug of absorbent cotton, previously moistened with *chloroform*, into a 250-ml round-bottomed flask, wash the funnel and absorbent cotton plug with two 10-ml quantities of *chloroform* and add the washings to the flask; evaporate to dryness using a rotary evaporator, allow to cool and dissolve the residue in 50 ml of *aldehyde-free ethanol (96%)*. Solution (2) contains 0.00225% w/v of *hydrocortisone BPCRS* in *aldehyde-free ethanol (96%)*.

Protect all the solutions from light. Transfer 10 ml of solution (1) into a stoppered test-tube and repeat for solution (2). Place in a water bath at 35° for 10 minutes, add 1 ml of *triphenyltetrazolium chloride solution* and 1 ml of *dilute tetramethylammonium hydroxide solution* to each tube, stopper and mix well; allow the tubes to stand in the water bath at 35° for a further 25 minutes, remove from the water bath and allow to stand in water for 5 minutes at room temperature. Measure the *absorbance* of the resulting solutions in a stoppered cell at the maximum at 485 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner using 10 ml of *aldehyde-free ethanol (96%)*.

Calculate the content of free hydrocortisone.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing the equivalent of 25 mg of hydrocortisone with 50 ml of *water* for 10 minutes, dilute to 100 ml with *water*, filter and discard the first 20 ml of the filtrate; dilute 4 ml of the remaining filtrate to 100 ml with *water* and measure the *absorbance*, Appendix II B, at the maximum at 248 nm using *water* in the reference cell. Calculate the content of hydrocortisone, $C_{21}H_{30}O_5$, in the tablets using 449 as the value of A(1%, 1 cm) at the maximum at 248 nm.

LABELLING

The label states the quantity of hydrocortisone sodium succinate in terms of the equivalent amount of hydrocortisone.

Hydrocortisone Sodium Phosphate Injection

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Sodium Phosphate Injection is a sterile solution of Hydrocortisone Sodium Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a freshly prepared mixture of 60 volumes of *butan-1-ol*, 20 volumes of *acetic anhydride* and 20 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute a volume of the injection containing the equivalent of 0.25 g of hydrocortisone to 100 ml with *water*. Solution (2) contains 0.34% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). Solution (4) is a mixture of equal volumes of solution (1) and a 0.25% w/v solution of *betamethasone sodium phosphate BPCRS* in *methanol*. After removal of the plate, allow it to dry in air until the solvent has evaporated, spray with *ethanolic sulphuric acid (20%)*, heat at 120° for 10 minutes and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot and the chromatogram obtained with solution (4) exhibits two principal spots with almost identical Rf values.

B. Evaporate 0.1 ml to dryness on a water bath and dissolve the residue in 2 ml of *sulphuric acid*. A yellowish green fluorescence is produced immediately (distinction from betamethasone sodium phosphate, dexamethasone sodium phosphate and prednisolone sodium phosphate).

TESTS

Alkalinity

pH, 7.5 to 8.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dilute a volume of the injection with *water* to contain the equivalent of 0.75% w/v of hydrocortisone. Solutions (2) and (3) contain 1.0% w/v of *hydrocortisone sodium phosphate BPCRS* and 0.020% w/v of *hydrocortisone BPCRS* in *methanol*, respectively. After removal of the plate, allow it to dry in air for 5 minutes and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Dilute a volume containing the equivalent of 0.2 g of hydrocortisone to 1000 ml with *water*. To 5 ml add 15 ml of *water*, 2.5 g of *sodium chloride* and 0.5 ml of *hydrochloric acid* and extract with three 25 ml quantities of *chloroform*. Wash each chloroform layer with the same 1 ml quantity of 0.1M *hydrochloric acid*, add the washings to the aqueous solution and discard the chloroform. Extract the aqueous solution with two 10 ml quantities of *tributyl orthophosphate*, discard the aqueous phase and extract the combined tributyl phosphate solutions with two 25 ml quantities of a solution containing 10% w/v of *sodium chloride* and 1% w/v of *anhydrous disodium hydrogen orthophosphate*. Filter the extracts successively through absorbent cotton and wash the filter with 10 ml of the chloride–phosphate solution. Dilute the combined filtrates to 100 ml with the chloride–phosphate solution and measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but using 20 ml of a solution containing 2.5 g of *sodium chloride* and 0.5 ml of *hydrochloric acid* and beginning at the words 'Extract the aqueous solution…'. Calculate the content of hydrocortisone sodium phosphate as $C_{21}H_{30}O_5$ taking 447 as the value of A(1%, 1 cm) at the maximum at 248 nm.

STORAGE

Hydrocortisone Sodium Phosphate Injection should be protected from light. The injection should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of hydrocortisone in a suitable dose-volume.

Hydrocortisone Sodium Phosphate Oral Solution

General Notices

NOTE: There are currently no licensed formulations in the United Kingdom.

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Sodium Phosphate Oral Solution is a solution containing Hydrocortisone Sodium Phosphate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the oral solution containing the equivalent of 0.25 g of hydrocortisone to 100 ml with *water*.

(2) 0.34% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol* .

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (1) and a 0.25% w/v solution of *betamethasone sodium phosphate BPCRS* in *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) Use the mobile phase described below.

(c) Apply 5 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated, spray with *ethanolic sulphuric acid (20%)*, heat at 120° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

A freshly prepared mixture of 20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol*.

SYSTEM SUITABILITY

The test is not valid unless the principal spot in the chromatogram obtained with solution (3) appears as a single compact spot and the chromatogram obtained with solution (4) exhibits two principal spots with almost identical Rf values.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Evaporate 0.1 ml to dryness on a water bath and dissolve the residue in 2 ml of *sulphuric acid*. A yellowish green fluorescence is produced immediately (distinction from betamethasone sodium phosphate, dexamethasone sodium phosphate and prednisolone sodium phosphate).

TESTS

Alkalinity

pH, 7.5 to 8.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a suitable volume of the oral solution with *water* to contain the equivalent of 0.75% w/v of hydrocortisone.

(2) 1.0% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*.

(3) A mixture of equal volumes of solutions (1) and (2).

(4) 0.020% w/v of *hydrocortisone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase described below.

(c) Apply 2 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 5 minutes and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

A mixture of 1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (3%).

ASSAY

Dilute a volume of the oral solution containing the equivalent of 20 mg of hydrocortisone to 100 ml with *water*. To 5 ml add 15 ml of *water*, 2.5 g of *sodium chloride* and 0.5 ml of *hydrochloric acid* and extract with three 25 ml quantities of *chloroform*. Wash each chloroform layer with the same 1 ml quantity of 0.1M *hydrochloric acid*, add the washings to the aqueous solution and discard the chloroform. Extract the aqueous solution with two 10 ml quantities of *tributyl orthophosphate*, discard the aqueous phase and extract the combined tributyl phosphate solutions with two 25 ml quantities of a solution containing 10% w/v of *sodium chloride* and 1% w/v of *anhydrous disodium hydrogen orthophosphate*. Filter the extracts successively through absorbent cotton and wash the filter with 10 ml of the chloride–phosphate solution. Dilute the combined filtrates to 100 ml with the chloride–phosphate solution and measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but using 20 ml of a solution containing 2.5 g of *sodium chloride* and 0.5 ml of *hydrochloric acid* and beginning at the words 'Extract the aqueous solution …'. Calculate the content of hydrocortisone sodium phosphate as $C_{21}H_{30}O_5$ taking 447 as the value of A (1%, 1 cm) at the maximum at 248 nm.

STORAGE

Hydrocortisone Sodium Phosphate Oral Solution should be protected from light. The oral solution should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of hydrocortisone in a suitable dose-volume.

Hydrocortisone Sodium Succinate Injection

General Notices

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Sodium Succinate Injection is a sterile solution of hydrocortisone sodium succinate in Water for Injections. It is prepared by dissolving Hydrocortisone Sodium Succinate for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hydrocortisone Sodium Succinate Injection deteriorates on storage and should be used immediately after preparation.

HYDROCORTISONE SODIUM SUCCINATE FOR INJECTION

DEFINITION

Hydrocortisone Sodium Succinate for Injection is a sterile material prepared from Hydrocortisone Hydrogen Succinate with the aid of a suitable alkali. It may contain excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydrocortisone sodium succinate *(RS 180)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 1 volume of *anhydrous formic acid*, 10 volumes of *absolute ethanol* and 150 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane*. Solution (1) contains 0.1% w/v of the contents of the sealed container. Solution (2) contains 0.1% w/v of *hydrocortisone hydrogen succinate EPCRS*. Solution (3) contains 0.1% w/v each of *hydrocortisone hydrogen succinate EPCRS* and *methylprednisolone hydrogen succinate EPCRS*. After removal of the plate, allow it to dry in air and examine in daylight and under *ultraviolet light (365 nm)*. By each method of visualisation the principal spot in the chromatogram obtained with solution (1) is similar in position to the spot in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two spots which may not be completely separated.

TESTS

Acidity or alkalinity

pH of a solution containing the equivalent of 5% w/v of hydrocortisone, 6.5 to 8.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *acetonitrile* and *water* to produce a solution containing the equivalent of 0.25% w/v of hydrocortisone. For solution (2) dilute 2 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *acetonitrile* and *water*. For solution (3) dilute a 0.035% w/v solution of *hydrocortisone BPCRS* in *acetonitrile* with an equal volume of *water*. For solution (4) dilute a solution containing 0.04% w/v each of *hydrocortisone hydrogen succinate EPCRS* and *dexamethasone BPCRS* in *acetonitrile* with an equal volume of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) a mixture of 330 volumes of *acetonitrile*, 600 volumes of *water* and 1 volume of *orthophosphoric acid* which is allowed to equilibrate and then diluted to 1000 volumes with *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

The test is not valid unless in the chromatogram obtained with solution (4) the *resolution factor* between the peaks corresponding to dexamethasone and hydrocortisone hydrogen succinate is at least 5.0.

For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to hydrocortisone is not greater than the area of the peak in the chromatogram obtained with solution (3) (7%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content

The content of hydrocortisone in each of 10 individual containers as determined in the Assay is not less than 92.5% and not more than 107.5% of the content of hydrocortisone stated on the label, except that in one container the weight may be not less than 85.0% and not more than 115.0% of the stated content.

ASSAY

Dissolve the contents of a sealed container in sufficient *water* to produce a solution containing the equivalent of 0.001% w/v of hydrocortisone. Measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, and calculate the content of $C_{21}H_{30}O_5$ taking 449 as the value of A(1%, 1 cm) at the maximum at 248 nm. Repeat the procedure with a further nine sealed containers and calculate the average content of $C_{21}H_{30}O_5$ per container from the ten individual results thus obtained.

LABELLING

The label of the sealed container states the quantity of hydrocortisone sodium succinate contained in it in terms of the equivalent amount of hydrocortisone.

Hydroflumethiazide Tablets

General Notices

Action and use

Thiazide diuretic.

DEFINITION

Hydroflumethiazide Tablets contain Hydroflumethiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydroflumethiazide, $C_8H_8F_3N_3O_4S_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Hydroflumethiazide with 10 ml of *acetone* for 10 minutes and filter. Solution (2) contains 0.1% w/v of *hydroflumethiazide BPCRS* in *acetone*. After removal of the plate, dry it in a current of air, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again. By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 25 mg of Hydroflumethiazide with 25 ml of *acetone* for 10 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 2.5 ml of *acetone*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *acetone*. After removal of the plate, dry it in a current of air and reveal the spots by *Method I*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 15 mg of Hydroflumethiazide with 50 ml of *methanol* for 10 minutes and dilute to 100 ml with *methanol*. Mix, filter, dilute 10 ml of the filtrate to 100 ml with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_8H_8F_3N_3O_4S_2$ taking 595 as the value of A(1%, 1 cm) at the maximum at 273 nm.

Hydrogen Peroxide Mouthwash

General Notices

DEFINITION

Hydrogen Peroxide Mouthwash is Hydrogen Peroxide Solution (6 per cent).

The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of hydrogen peroxide, H_2O_2

5.0 to 7.0% w/v.

IDENTIFICATION

Acidity; Non-volatile matter; Organic stabilisers Complies with the requirements stated under Hydrogen Peroxide Solution (6 per cent).

ASSAY

Dilute 10 ml to 100 ml with *water*. To 10 ml of the resulting solution add 20 ml of 1M *sulphuric acid* and titrate with 0.02M *potassium permanganate VS*. Each ml of 0.02M *potassium permanganate VS* is equivalent to 1.701 mg of H_2O_2.

STORAGE

Hydrogen Peroxide Mouthwash should be protected from light.

LABELLING

The label states, where applicable, that the Mouthwash contains a stabilising agent.

Hydrotalcite Tablets

General Notices

Action and use

Antacid.

DEFINITION

Hydrotalcite Tablets contain Hydrotalcite.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydrotalcite, $Al_2Mg_6(OH)_{16}CO_3,4H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Add 20 ml of 2M *hydrochloric acid* to a quantity of the powdered tablets containing 1.0 g of Hydrotalcite, shake and filter. Add 30 ml of *water* to the filtrate and boil. Add 2M *ammonia* until just alkaline to *methyl red*, continue boiling for 2 minutes and filter. Wash the precipitate with 50 ml of a hot 2% w/v solution of *ammonium chloride* and dissolve in 15 ml of 2M *hydrochloric acid*. The resulting solution yields the reaction characteristic of *aluminium salts*, Appendix VI.

Neutralising capacity

Weigh and powder 20 tablets, pass the powder as completely as possible through a sieve of nominal mesh aperture about 225 µm and remix the sifted powder. Mix a quantity equivalent to one tablet with a small quantity of *water*, added slowly with stirring, to give a smooth paste and add gradually sufficient further quantities of *water* to produce 100 ml. Warm to 37°, add 100 ml of 0.1M *hydrochloric acid VS* previously heated to 37° and stir continuously using a paddle stirrer at a rate of about 200 revolutions per minute, maintaining the temperature at 37°. The pH of the solution at 37°, after 10 minutes and after 20 minutes, is 3.0 to 4.2, Appendix V L. Add 12 ml of 0.5M *hydrochloric acid VS* at 37°, stir continuously for 1 hour, maintaining the temperature at 37°, and titrate with 0.1M *sodium hydroxide VS* to pH 3.5. Subtract the number of ml of 0.1M *sodium hydroxide VS* from 160 ml to obtain the number of ml of 0.1M *hydrochloric acid VS* required for neutralisation. Not less than 130 ml of 0.1M *hydrochloric acid VS* is required to neutralise one tablet.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.3 g of Hydrotalcite add 2 ml of 7M *hydrochloric acid* and heat on a water bath for 15 minutes. Allow to cool, add 250 ml of *water* and 50 ml of 0.05M *disodium edetate VS* and neutralise with 1M *sodium hydroxide* using *methyl red solution* as indicator. Heat the solution on a water bath for 30 minutes and allow to cool. Add 3 g of *hexamine* and titrate the excess of disodium edetate with 0.05M *lead nitrate VS* using *xylenol orange solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 15.09 mg of $Al_2Mg_6(OH)_{16}CO_3,4H_2O$.

Hydrous Ointment

General Notices

Oily Cream

DEFINITION

Wool Alcohols Ointment	500 g
Phenoxyethanol	10 g
Dried Magnesium Sulphate	5 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

In preparing Hydrous Ointment the proportions of Hard Paraffin, Soft Paraffin and Liquid Paraffin used to make the Wool Alcohols Ointment may be varied to produce Hydrous Ointment having suitable properties.

When Hydrous Ointment is used in a white ointment, it should be prepared from Wool Alcohols Ointment made with White Soft Paraffin; when used in a coloured ointment, it should be prepared from Wool Alcohols Ointment made with Yellow Soft Paraffin.

Extemporaneous preparation

The following directions apply.

Dissolve the Phenoxyethanol and the Dried Magnesium Sulphate in sufficient warm Purified Water to produce about 500 g. Melt the Wool Alcohols Ointment and heat to about 60°; gradually add the aqueous solution at about 60° with vigorous stirring until a smooth cream is obtained. Stir until cool, add sufficient Purified Water to produce 1000 g and mix.

The ointment complies with the requirements stated under Topical Semi-solid Preparations.

STORAGE

Hydrous Ointment should be kept in a container made from non-absorbent material. If, on storage, some aqueous liquid separates, it is readily reincorporated by stirring.

Hydroxocobalamin Injection

General Notices

Action and use

Vitamin B_{12} analogue.

DEFINITION

Hydroxocobalamin Injection is a sterile solution of Hydroxocobalamin Acetate, Hydroxocobalamin Chloride or Hydroxocobalamin Sulphate in Water for Injections containing sufficient Acetic Acid, Hydrochloric Acid or Sulphuric Acid respectively to adjust the pH to about 4.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydroxocobalamin, $C_{62}H_{89}CoN_{13}O_{15}P$

95.0 to 110.0% of the stated amount of anhydrous hydroxocobalamin.

IDENTIFICATION

Measure the *absorbance* at 351 nm and at 361 nm, Appendix II B. The ratio of the absorbance at 361 nm to that at 351 nm is about 0.65.

TESTS

Acidity

pH, 3.8 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, injecting 20 µl of each of the following solutions. Solutions (1) to (3) are freshly prepared solutions of the injection, diluted if necessary with the mobile phase, containing the equivalent of (1) 0.10% w/v, (2) 0.005% w/v and (3) 0.00010% w/v of hydroxocobalamin. For solution (4) add 0.2 ml of a freshly prepared 2% w/v solution of *chloramine T* and 0.1 ml of 0.05M *hydrochloric acid* to a volume containing the equivalent of 5 mg of hydroxocobalamin, dilute to 10 ml with *water,* shake, allow to stand for 5 minutes and inject immediately. Protect the solutions from bright light.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Lichrosorb 100 CH8/11 is suitable), (b) a mixture of 19.5 volumes of *methanol* and 80.5 volumes of a solution containing 1.5% w/v of *citric acid* and 0.81% w/v of *disodium hydrogen orthophosphate* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 351 nm.

The test is not valid unless the chromatogram obtained with solution (4) shows three principal peaks, the *resolution factor* between each pair of adjacent peaks is not less than 3.0 and the chromatogram obtained with solution (3) shows one principal peak with a *signal-to-noise ratio* of not less than 5.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (10%). Disregard any peak the area of which is less than that of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the following procedure protected from light. Dilute a quantity containing the equivalent of 2.5 mg of anhydrous hydroxocobalamin to 100 ml with a solution containing 0.8% v/v of *glacial acetic acid* and 1.09% w/v of *sodium acetate* and measure the *absorbance* of the resulting solution at the maximum at 351 nm, Appendix II B. Calculate the content of $C_{62}H_{89}CoN_{13}O_{15}P$ taking 195 as the value of A(1%, 1 cm) at the maximum at 351 nm.

STORAGE

Hydroxocobalamin Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of anhydrous hydroxocobalamin in a suitable dose-volume.

When vitamin B_{12} injection is prescribed or demanded, Hydroxocobalamin Injection shall be dispensed or supplied.

Hydroxycarbamide Capsules

General Notices

Action and use

Cytotoxic alkylating drug.

DEFINITION

Hydroxycarbamide Capsules contain Hydroxycarbamide.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of hydroxycarbamide, $CH_4N_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 30 mg of Hydroxycarbamide with 10 ml of *methanol* and filter. Evaporate the filtrate to dryness and dry the residue at 60° at a pressure of 2 kPa for 3 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hydroxycarbamide *(RS 184)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TEST

Urea

Carry out the method for *thin-layer chromatography*, Appendix III A, using a cellulose F precoated plate (Merck cellulose F plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 1 volume of *water* and 4 volumes of *butan-1-ol* as the mobile phase and developing the chromatograms for 18 hours. Apply separately to the plate 50 µl of each of the following solutions in several small volumes. For solution (1) shake a quantity of the contents of the capsules containing 0.5 g of Hydroxycarbamide with 10 ml of *water* for 15 minutes, dilute to 25 ml with *water* and filter. Solution (2) contains 0.01% w/v of *urea*. After removal of the plate, dry it in a current of air, spray with a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *ethanol (96%)* containing 2% v/v of *hydrochloric acid*. In the chromatogram obtained with solution (1), any spot corresponding to urea is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the mixed, finely powdered contents of 20 capsules containing 1 g of Hydroxycarbamide with 450 ml of *water* for 5 minutes, stir for 30 minutes with the aid of ultrasound, add sufficient *water* to produce 500 ml and mix well. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume of the filtrate with 1 volume of *water*. Solution (2) contains 0.10% w/v of *hydroxycarbamide BPCRS*. Solution (3) contains 0.10% w/v of *hydroxycarbamide BPCRS* and 0.4% w/v of *hydroxylamine hydrochloride*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) *water* as the mobile phase with a flow rate of 0.5 ml per minute and (c) a detection wavelength of 214 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between hydroxycarbamide and hydroxylamine hydrochloride is at least 1.0.

Calculate the content of $CH_4N_2O_2$ in the capsules using the declared content of $CH_4N_2O_2$ in *hydroxycarbamide BPCRS*.

STORAGE

Hydroxycarbamide Capsules should be protected from moisture.

Hydroxychloroquine Tablets

General Notices

Action and use

Antiprotozoal (malaria).

DEFINITION

Hydroxychloroquine Tablets contain Hydroxychloroquine Sulphate. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydroxychloroquine sulphate, $C_{18}H_{26}ClN_3O,H_2SO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulphate in a mixture of 10 ml of *water* and 2 ml of 2M *sodium hydroxide* and extract with two 20 ml quantities of *chloroform*. Wash the chloroform extracts with *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform IR*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of hydroxychloroquine *(RS 182)*.

B. Extract a quantity of the powdered tablets containing 0.2 g of Hydroxychloroquine Sulphate with 10 ml of *water* and filter. To the filtrate add 30 ml of hot *picric acid solution R1* and allow to cool. The *melting point* of the precipitate, after washing with 10 ml of *water*, is about 189°, Appendix V A.

C. Shake a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulphate with 10 ml of *water* and filter. To the filtrate add 1 ml of 2M *hydrochloric acid* and 1 ml of *barium chloride solution*. A white precipitate is produced.

TEST

Disintegration

Maximum time, 45 minutes, Appendix XII A1.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Hydroxychloroquine Sulphate in 20 ml of 1M *sodium hydroxide* and extract with four 25 ml quantities of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, determining the end point potentiometrically. Each ml of 0.1M *perchloric acid VS* is equivalent to 21.70 mg of $C_{18}H_{26}ClN_3O,H_2SO_4$.

200 mg of Hydroxychloroquine Sulphate is approximately equivalent to 156 mg of

hydroxychloroquine.

Hyoscine Butylbromide Injection

General Notices

Action and use

Anticholinergic.

DEFINITION

Hyoscine Butylbromide Injection is a sterile solution of Hyoscine Butylbromide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Evaporate to dryness a volume containing 0.1 g of Hyoscine Butylbromide, shake the residue with *chloroform*, filter, evaporate the filtrate to dryness and triturate the residue with 5 ml of *acetonitrile*. Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hyoscine butylbromide *(RS 185)*. Retain the residue for use in test C.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits maxima at 252, 257 and 264 nm and a less well-defined maximum at 247 nm.

C. To 1 mg of the residue obtained in test A add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water bath. Dissolve the residue in 2 ml of *acetone* and add 0.1 ml of a 3% w/v solution of *potassium hydroxide* in *methanol*. A violet colour is produced.

TESTS

Acidity

pH, 3.7 to 5.5, Appendix V L.

Hyoscine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection diluted, if necessary, with 0.001M *hydrochloric acid* to contain 1.0% w/v of Hyoscine Butylbromide. Solution (2) contains 0.0010% w/v of *hyoscine hydrobromide BPCRS* in 0.001M *hydrochloric acid*. For solution (3) add 10 µl of solution (1) to 10 ml of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb 10µ C8 is suitable), (b) a solution of 2.0 g of *sodium dodecyl sulphate* in a mixture of 370 ml of 0.001M *hydrochloric acid* and 680 ml of *methanol* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 210 nm.

Inject 20 µl of solution (3). The test is not valid unless the *resolution factor* between the peaks corresponding to hyoscine and butylhyoscine is at least 5.

Inject 20 µl of each of solutions (1) and (2). The area of any peak corresponding to hyoscine in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} high-performance precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable) and a mixture of 0.5 volume of *anhydrous formic acid* , 1.5 volumes of *water*, 9 volumes of *absolute ethanol* and 9 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 4 cm above the line of application. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dilute the injection, if necessary, with 0.01M *hydrochloric acid* to contain 2% w/v of Hyoscine Butylbromide. For solution (2) dilute 3 volumes of solution (1) to 100 volumes with 0.01M *hydrochloric acid*. For solution (3) dilute 1 volume of solution (1) to 50 volumes with 0.01M *hydrochloric acid*. For solution (4) dilute 1 volume of solution (1) to 400 volumes with 0.01M *hydrochloric acid*. After removal of the plate, dry it at 60° for 15 minutes, spray with a solution prepared by mixing equal volumes of a 40% w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 ml of *glacial acetic acid* and 40 ml of *water* and diluting 1 volume of the mixture with 2 volumes of *glacial acetic acid* and 10 volumes of *water* immediately before use. Allow the plate to dry in air, spray well with a 5% w/v solution of *sodium nitrite* and examine immediately. In the chromatogram obtained with solution (1) the principal spot has an Rf value of about 0.45. In the chromatogram obtained with solution (1) any *secondary spot* with an Rf value less than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (2) (3%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.25%); any *secondary spot* with an Rf value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (3) (2%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.25%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection to contain 0.04% w/v of Hyoscine Butylbromide with 0.001M *hydrochloric acid*. Solution (2) contains 0.04% w/v of *hyoscine butylbromide BPCRS* in 0.001M *hydrochloric acid*.

The chromatographic procedure described under the test for Hyoscine may be used.

Calculate the content of $C_{21}H_{30}BrNO_4$ using the declared content of $C_{21}H_{30}BrNO_4$ in *hyoscine butylbromide BPCRS*.

STORAGE

Hyoscine Butylbromide Injection should be protected from light.

Hyoscine Butylbromide Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Hyoscine Butylbromide Tablets contain Hyoscine Butylbromide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Hyoscine Butylbromide with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and triturate the residue with 5 ml of *acetonitrile*. Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hyoscine butylbromide *(RS 185)*.

B. To 1 mg of the residue obtained in test A add 0.2 ml of *fuming nitric acid* and evaporate to dryness on a water bath. Dissolve the residue in 2 ml of *acetone* and add 0.1 ml of a 3% w/v solution of *potassium hydroxide* in *methanol*. A violet colour is produced.

C. Shake a quantity of the powdered tablets containing 50 mg of Hyoscine Butylbromide with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness, shake the residue with 50 ml of *water* and filter. The *light absorption* of the filtrate, Appendix II B, in the range 230 to 350 nm exhibits maxima at 252, 257 and 264 nm and a less well-defined maximum at 247 nm.

TESTS

Hyoscine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Hyoscine Butylbromide with 10 ml of 0.001M *hydrochloric acid* with the aid of ultrasound for 15 minutes, centrifuge and filter. Solution (2) contains 0.0010% w/v of *hyoscine hydrobromide BPCRS* in 0.001M *hydrochloric acid*. For solution (3) add 10 µl of solution (1) to 10 ml of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb 10µ C8 is suitable), (b) a solution of 2.0 g of *sodium dodecyl sulphate* in a mixture of 370 ml of 0.001M *hydrochloric acid* and 680 ml of *methanol* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 210 nm.

Inject 20 µl of solution (3). The test is not valid unless the *resolution factor* between the peaks corresponding to hyoscine and butylhyoscine is at least 5.

Inject 20 µl of each of solutions (1) and (2). The area of any peak corresponding to hyoscine in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} high-performance precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable) and a mixture of 0.5 volume of *anhydrous formic acid*, 1.5 volumes of *water*, 9 volumes of *absolute ethanol* and 9 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 4 cm above the line of application. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Hyoscine Butylbromide with 5 ml of 0.01M *hydrochloric acid* and centrifuge. For solution (2) dilute 3 volumes of solution (1) to 100 volumes with 0.01M *hydrochloric acid*. For solution (3) dilute 1 volume of solution (1) to 50 volumes with 0.01M *hydrochloric acid*. For solution (4) dilute 1 volume of solution (1) to 400 volumes with 0.01M *hydrochloric acid*. After removal of the plate, dry it at 60° for 15 minutes, spray with a solution prepared by mixing equal volumes of a 40% w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 ml of *glacial acetic acid* and 40 ml of *water* and diluting 1 volume of the mixture with 2 volumes of *glacial acetic acid* and 10 volumes of *water* immediately before use. Allow the plate to dry in air, spray well with a 5% w/v solution of *sodium nitrite* and examine immediately. In the chromatogram obtained with solution (1) the principal spot has an Rf value of about 0.45. In the chromatogram obtained with solution (1) any *secondary spot* with an Rf value less than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (2) (3%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.25%); any *secondary spot* with an Rf value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (3) (2%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.25%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 40 mg of Hyoscine Butylbromide with 60 ml of 0.001M *hydrochloric acid* with the aid of ultrasound for 15 minutes, dilute to 100 ml with the same solvent, centrifuge and filter to obtain a clear filtrate. Solution (2) contains 0.04% w/v of *hyoscine butylbromide BPCRS* in 0.001M *hydrochloric acid*.

The chromatographic procedure described under the test for Hyoscine may be used.

Calculate the content of $C_{21}H_{30}BrNO_4$ in the tablets using the declared content of $C_{21}H_{30}BrNO_4$ in *hyoscine butylbromide BPCRS*.

Hyoscine Eye Drops

General Notices

Action and use

Anticholinergic.

DEFINITION

Hyoscine Eye Drops are a sterile solution of Hyoscine Hydrobromide in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{23}NO_4,HBr,3H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) evaporate a volume of the eye drops containing 5 mg of Hyoscine Hydrobromide to dryness on a water bath, triturate the residue with 1 ml of *ethanol (96%)*, allow to stand and use the supernatant liquid. Solution (2) contains 0.5% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%).* After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) .

B. In the Assay, the chromatogram obtained with solution (1) shows a peak of similar size and with the same retention time as the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*. For solution (1) dilute the eye drops, if necessary, to produce a solution containing 0.125% w/v of Hyoscine Hydrobromide. Solution (2) contains 0.125% w/v of *hyoscine hydrobromide BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) and a stainless steel pre-column (1.0 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 31 volumes of *methanol* and 68 volumes of *water*, adjusted to pH 2.5 with 13.5M *ammonia* and (c) a detection wavelength of 240 nm. When chlorhexidine is used as a preservative allow the chromatography for solution (1) to proceed until the chlorhexidine has eluted (this may be up to 20 times the retention time of the peak due to hyoscine hydrobromide).

Calculate the content of $C_{17}H_{21}NO_4$,HBr,$3H_2O$ using the declared content of $C_{17}H_{21}NO_4$,HBr in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4$,HBr is equivalent to 1.141 mg of $C_{17}H_{21}NO_4$,HBr,$3H_2O$.

Hyoscine Injection

General Notices

Action and use

Anticholinergic.

DEFINITION

Hyoscine Injection is a sterile solution of Hyoscine Hydrobromide in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{21}NO_4$,HBr,3H_2O

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) evaporate a volume of the injection containing 5 mg of Hyoscine Hydrobromide to dryness on a water bath, triturate the residue with 1 ml of *ethanol (96%),* allow to stand and use the supernatant liquid. Solution (2) contains 0.5% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%).* After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) .

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention as the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, to produce a solution containing 0.04% w/v of Hyoscine Hydrobromide. Solution (2) contains 0.04% w/v of *hyoscine hydrobromide BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) and a stainless steel pre-column (1.0 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 31 volumes of *methanol* and 68 volumes of *water*, adjusted to pH 2.5 with 13.5M *ammonia* and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{17}H_{21}NO_4$,HBr,3H_2O using the declared content of $C_{17}H_{21}NO_4$,HBr in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4$,HBr is equivalent to 1.141 mg of $C_{17}H_{21}NO_4$,HBr,3H_2O.

STORAGE

Hyoscine Injection should be protected from light.

Hyoscine Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Hyoscine Tablets contain Hyoscine Hydrobromide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{21}NO_4,HBr,3H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of powdered tablets containing 0.5 mg of Hyoscine Hydrobromide with 5 ml of 0.1M *hydrochloric acid*. Extract, with gentle swirling, with three 5 ml quantities of *dichloromethane* and discard the extracts. Add 1 ml of 5M *ammonia* to the aqueous phase and extract with two 5 ml quantities of *dichloromethane*. Dry the combined dichloromethane extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 0.5 ml of *ethanol (96%)*. Solution (2) contains 0.1% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%)*. After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Uniformity of content

Tablets containing less than 2 mg of Hyoscine Hydrobromide comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in a 0.02% w/v solution of *atropine sulphate BPCRS* (internal standard) in *acetonitrile (25%)* (solution A). For solution (1) add 1 ml of solution A to one tablet and disintegrate with the aid of ultrasound. Shake the mixture for 2 minutes, centrifuge and filter the supernatant liquid using a suitable 0.45-µm filter. Solution (2) contains 0.015% w/v of *hyoscine hydrobromide BPCRS* in solution A.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) a solution containing 0.05M *sodium octanesulphonate* in a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 3 volumes of *methanol*, 21 volumes of *acetonitrile* and 75 volumes of *water* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{17}H_{21}NO_4$,HBr,$3H_2O$ in each tablet using the declared content of $C_{17}H_{21}NO_4$,HBr in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4$,HBr is equivalent to 1.141 mg of $C_{17}H_{21}NO_4$,HBr,$3H_2O$.

ASSAY

Prepare a 0.02% w/v solution of *atropine sulphate BPCRS* (internal standard) in *acetonitrile (25%)* (solution A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.015% w/v of *hyoscine hydrobromide BPCRS* in solution A. For solution (2) add to 10 whole tablets 7 ml of *acetonitrile (25%)*, disintegrate with the aid of ultrasound and shake the mixture for 2 minutes. Add sufficient *acetonitrile (25%)* to produce a final solution containing 0.015% w/v of Hyoscine Hydrobromide, centrifuge and filter the supernatant liquid using a suitable 0.45-µm filter. Prepare solution (3) in the same manner as solution (2) but using solution A in place of acetonitrile (25%).

The chromatographic conditions described under Uniformity of content may be used.

Calculate the content of $C_{17}H_{21}NO_4$,HBr,$3H_2O$ using the declared content of $C_{17}H_{21}NO_4$,HBr in *hyoscine hydrobromide BPCRS.* Each mg of $C_{17}H_{21}NO_4$,HBr is equivalent to 1.141 mg of $C_{17}H_{21}NO_4$,HBr,$3H_2O$.

Hypromellose Eye Drops

General Notices

Alkaline Eye Drops; Artificial Tears

Action and use

Artificial tears.

Content

85.0 to 115.0% of stated amount.

DEFINITION

Hypromellose Eye Drops are a sterile solution of Hypromellose in Purified Water. They are isotonic with tear secretions.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

A. Heat 5 ml in a water bath, with stirring. Above 50° the solution becomes cloudy or a flocculent precipitate is produced. The solution becomes clear on cooling.

B. To 5 ml add 0.15 ml of 2M *acetic acid* and 1.2 ml of a 10% w/v solution of *tannic acid*. A yellowish white, flocculent precipitate is produced which dissolves in 6M *ammonia*.

TESTS

Clarity of solution

The eye drops are not more opalescent than *reference suspension IV,* Appendix IV A.

Alkalinity

pH, 8.2 to 8.6, Appendix V L.

Viscosity

70 to 130% of the declared value when determined by Appendix V H, Method I, at 20° and using a viscometer of a size appropriate to the nominal viscosity.

ASSAY

For solution A, dissolve 3.75 g of *diphenylamine* in 150 ml of *glacial acetic acid* then add 90 ml of *hydrochloric acid* and mix well.

For solution (1), use the eye drops, diluted if necessary, with water to contain 0.01% w/v of Hypromellose. Pipette 2 ml of this solution into a glass stoppered test tube, add 5 ml of solution A, mix and immediately immerse the test tube in an oil bath maintained at 105° to 110° for 30 minutes. Remove the test tube, cool in an ice bath for 10 minutes and allow to equilibrate to room temperature. For solution (2), prepare a solution containing 0.01% w/v of *hypromellose BPCRS* in *water*, and treat at the same time and in the same manner as solution (1), starting at the words "pipette 2 ml of this solution ….". For solution (3), use *water*, and treat at the same time and in the same manner as solution (1), starting at the words "pipette 2 ml of this solution….".

Measure the *absorbances* of solution (1) and solution (2) at the maximum at about 635 nm, Appendix II B, using solution (3) in the reference cell. Calculate the content of Hypromellose in the eye drops from the values of the absorbances obtained and using the declared content of Hypromellose in *hypromellose BPCRS*.

LABELLING

The label states the nominal viscosity in millipascal seconds.

When methylcellulose eye drops are prescribed or demanded, Hypromellose Eye Drops shall be dispensed or supplied.

Strong Haloperidol Oral Solution

General Notices

Strong Haloperidol Oral Drops

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Strong Haloperidol Oral Solution is an aqueous solution containing 1% w/v of Haloperidol. It is intended to be diluted before use.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

0.95 to 1.05% w/v.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. To 2 ml add 10 ml of *water* and 1 ml of 1M *sodium hydroxide*, extract with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 3.5 to 4.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 92 volumes of *dichloromethane*, 8 volumes of *methanol* and 1 volume of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. Solution (1) is the preparation being examined. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *water*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *water*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To 1 ml add 10 ml of *water* and 10 ml of 1M *hydrochloric acid* and extract with two 10 ml quantities of *ether*. Wash the combined ether extracts with 10 ml of *water*, combine the aqueous solutions and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 ml and dilute 10 ml to 100 ml with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Strong Haloperidol Oral Solution should be protected from light. It should not be refrigerated.

LABELLING

The label states that the preparation is to be diluted before use.

Water for Diluting Concentrated Haemodialysis Solutions

General Notices

(Haemodialysis Solutions, Concentrated, Water for Diluting, Ph Eur monograph 1167)

Ph Eur

The following monograph is given for information.

The analytical methods described and the limits proposed are intended to be used for validating the procedure for obtaining the water.

DEFINITION

Water for diluting concentrated haemodialysis solutions is obtained from potable water by distillation, by reverse osmosis, by ion exchange or by any other suitable method. The conditions of preparation, transfer and storage are designed to minimise the risk of chemical and microbial contamination.

When water obtained by one of the methods described above is not available, potable water may be used for home dialysis. Because the chemical composition of potable water varies considerably from one locality to another, consideration must be given to its chemical composition to enable adjustments to be made to the content of ions so that the concentrations in the diluted solution correspond to the intended use.

Attention has also to be paid to the possible presence of residues from water treatment (for example, chloramines) and volatile halogenated hydrocarbons.

For the surveillance of the quality of water for diluting concentrated haemodialysis solutions, the following methods may be used to determine the chemical composition and/or to detect the presence of possible contaminants together with suggested limits to be obtained.

CHARACTERS

Clear, colourless, tasteless liquid.

TESTS

Acidity or alkalinity

To 10 ml of the water to be examined, freshly boiled and cooled in a borosilicate glass flask, add 0.05 ml of *methyl red solution R*. The solution is not red. To 10 ml of the water to be examined add 0.1 ml of *bromothymol blue solution R1*. The solution is not blue.

Oxidisable substances

To 100 ml of the water to be examined add 10 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Total available chlorine

Maximum 0.1 ppm.

In a 125 ml test-tube (A), place successively 5 ml of *buffer solution pH 6.5 R,* 5 ml of *diethylphenylenediamine sulphate solution R* and 1 g of *potassium iodide R*. In a second 125 ml test-tube (B), place successively 5 ml of *buffer solution pH 6.5 R* and 5 ml of *diethylphenylenediamine sulphate solution R*. Add as simultaneously as possible to tube A 100 ml of the water to be examined and to tube B a reference solution prepared as follows: to 1 ml of a 10 mg/l solution of *potassium iodate R*, add 1 g of *potassium iodide R* and 1 ml of *dilute sulphuric acid R*; allow to stand for 1 min, add 1 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*. Any colour in the mixture obtained with the water to be examined is not more intense than that in the mixture obtained with the reference solution.

Chlorides (2.4.4)

Maximum 50 ppm.

Dilute 1 ml of the water to be examined to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Fluorides

Maximum 0.2 ppm.

Potentiometry (*2.2.36, Method I*): use as indicator electrode a fluoride-selective solid-membrane electrode and as reference electrode a silver-silver chloride electrode.

Test solution The water to be examined.

Reference solutions Dilute 2.0 ml, 4.0 ml and 10.0 ml of *fluoride standard solution (1 ppm F) R* respectively to 20.0 ml with *total-ionic-strength-adjustment buffer R1*.

Carry out the measurement of each solution.

Nitrates

Maximum 2 ppm.

Dilute 2 ml of the water to be examined to 100 ml with *nitrate-free water R*. Place 5 ml of the dilution in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R* and 0.1 ml of *diphenylamine solution R* and then, dropwise and with shaking, 5 ml of *sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. Allow to stand for 15 min. Any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 0.1 ml of *nitrate standard solution (2 ppm* NO_3*) R* and 4.9 ml of *nitrate-free water R*.

Sulphates (*2.4.13*)

Maximum 50 ppm.

Dilute 3 ml of the water to be examined to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Aluminium (*2.4.17*)

Maximum 10 µg/l.

Prescribed solution To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Reference solution Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate* *buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R.*

Ammonium

Maximum 0.2 ppm.

To 20 ml of the water to be examined in a flat-bottomed and transparent tube, add 1 ml of *alkaline potassium tetraiodomercurate solution R*. Allow to stand for 5 min. The solution is not more intensely coloured than a standard prepared at the same time and in the same manner using a mixture of 4 ml of *ammonium standard solution (1 ppm* NH_4*) R* and 16 ml of *ammonium-free water R*. Examine the solutions along the vertical axis of the tube.

Calcium

Maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method* I).

Test solution The water to be examined.

Reference solutions Prepare reference solutions (1 ppm to 5 ppm) using *calcium standard solution (400 ppm Ca) R.*

Source Calcium hollow-cathode lamp.

Wavelength 422.7 nm.

Atomisation device Oxidising air-acetylene flame.

Magnesium

Maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 10 ml of the water to be examined to 100 ml with *distilled water R*.

Reference solutions Prepare reference solutions (0.1 ppm to 0.5 ppm) using *magnesium standard solution (100 ppm Mg) R.*

Source Magnesium hollow-cathode lamp.

Wavelength 285.2 nm.

Atomisation device Oxidising air-acetylene flame.

Mercury

Maximum 0.001 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Add 5 ml of *nitric acid R* per litre of the water to be examined. In a 50 ml borosilicate glass flask with a ground-glass-stopper, place 20 ml of the water to be examined and add 1 ml of *dilute nitric acid R* and shake. Add 0.3 ml of *bromine water R1*. Stopper the flask, shake and heat the stoppered flask at 45 °C for 4 h. Allow to cool. If the solution does not become yellow, add 0.3 ml of *bromine water R1* and re-heat at 45 °C for 4 h. Add 0.5 ml of a freshly prepared 10 g/l solution of *hydroxylamine hydrochloride R*. Shake. Allow to stand for 20 min.

Reference solutions Use freshly prepared reference solutions (0.0005 ppm to 0.002 ppm) obtained by diluting *mercury standard solution (1000 ppm Hg) R* with a 5 per cent *V/V* solution of *dilute nitric acid R* and treat as described for the test solution.

To a volume of solution suitable for the instrument to be used, add *stannous chloride solution R2* equal to 1/5 of this volume. Fit immediately the device for the entrainment of the mercury vapour. Wait 20 s and pass through the device a stream of *nitrogen R* as the carrier gas.

Source Mercury hollow-cathode tube or a discharge lamp.

Wavelength 253.7 nm.

Atomisation device Flameless system whereby the mercury can be entrained in the form of cold vapour.

Potassium

Maximum 2.0 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution (a) Dilute 50.0 ml of the water to be examined to 100 ml with *distilled water R*. Carry out a determination using this solution. If the potassium content is more than 0.75 mg/l, further dilute the water to be examined with *distilled water R*.

Test solution (b) Take 50.0 ml of the water to be examined or, if necessary, the water to be examined diluted as described in the preparation of test solution (a). Add 1.25 ml of *potassium standard solution (20 ppm K) R* and dilute to 100.0 ml with *distilled water R*.

Reference solutions Prepare reference solutions (0 ppm; 0.25 ppm; 0.50 ppm; 0.75 ppm; 1 ppm) using *potassium standard solution (20 ppm K) R.*

Wavelength 766.5 nm.

Calculate the potassium content of the water to be examined in parts per million from the expression:

$$\frac{p \times n_1 \times 0.5}{n_2 - n_1}$$

p = dilution factor used for the preparation of test solution (a),

n_1 = measured value of test solution (a),

n_2 = measured value of test solution (b).

Sodium

Maximum 50.0 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution The water to be examined. If the sodium content is more than 10 mg/l, dilute with *distilled water R* to obtain a concentration suitable for the apparatus used.

Reference solutions Prepare reference solutions (0 ppm; 2.5 ppm; 5.0 ppm; 7.5 ppm; 10

ppm) using *sodium standard solution (200 ppm Na) R.*

Wavelength 589 nm.

Zinc

Maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*): use sampling and analytical equipment free from zinc or not liable to yield zinc under the conditions of use.

Test solution The water to be examined.

Reference solutions Prepare reference solutions (0.05 ppm to 0.15 ppm) using *zinc standard solution (100 ppm Zn) R.*

Source Zinc hollow-cathode lamp.

Wavelength 213.9 nm.

Atomisation device Oxidising air-acetylene flame.

Heavy metals (*2.4.8*)

Maximum 0.1 ppm.

Heat 200 ml of the water to be examined in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Microbial contamination

Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per millilitre, determined by plate count.

Bacterial endotoxins (*2.6.14*)

Less than 0.25 IU/ml.

Ph Eur

Alcoholic Iodine Solution

General Notices

DEFINITION

Alcoholic Iodine Solution is a *cutaneous solution*.

Iodine	25 g
Potassium Iodide	25 g
Purified Water	25 ml
Ethanol (90 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Potassium Iodide and the Iodine in the Purified Water and add sufficient Ethanol (90 per cent) to produce 1000 ml.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of iodine, I

2.4 to 2.7% w/v.

Content of potassium iodide, KI

2.4 to 2.7% w/v.

Ethanol content

83 to 88% v/v, Appendix VIII F.

ASSAY

For iodine

Dilute 10 ml with 20 ml of *water* and titrate with 0.1M *sodium thiosulphate VS*. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 12.69 mg of I.

For potassium iodide

To 10 ml add 30 ml of *water* and 50 ml of *hydrochloric acid* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes pale brown. Add 1 ml of *amaranth solution* and continue the titration until the red colour just changes to pale yellow. From the number of ml of 0.05M *potassium iodate VS* required subtract half the number of ml of 0.1M *sodium thiosulphate VS* required in the Assay for iodine. Each ml of the remainder is equivalent to 16.60 mg of KI.

STORAGE

Alcoholic Iodine Solution should be kept in a well-closed container, the materials of which are resistant to iodine.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

The label indicates the pharmaceutical form as 'cutaneous solution'.

When iodine tinture is prescribed or demanded Alcoholic Iodine Solution shall be dispensed or supplied.

Aqueous Iodine Oral Solution

General Notices

DEFINITION

Iodine	50 g
Potassium Iodide	100 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Potassium Iodide and the Iodine in 100 ml of the Purified Water and add sufficient of the Purified Water to produce 1000 ml.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of iodine, I

4.75 to 5.25% w/v.

Content of potassium iodide, KI

9.5 to 10.5% w/v.

ASSAY

Dilute 25 ml to 100 ml with *water*.

For iodine

To 20 ml of the diluted solution add 10 ml of *water* and titrate with 0.1M *sodium thiosulphate VS*. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 12.69 mg of I.

For potassium iodide

To 10 ml of the diluted solution add 20 ml of *water* and 40 ml of *hydrochloric acid* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes pale brown. Add 1 ml of *amaranth solution* and continue the titration until the red colour just changes to pale yellow. From the number of ml of 0.05M *potassium iodate VS* required subtract one quarter of the number of ml of 0.1M *sodium thiosulphate VS* required in the Assay for iodine. Each ml of the remainder is equivalent to 16.60 mg of KI.

STORAGE

Aqueous Iodine Oral Solution should be kept in a well-closed container, the materials of which are resistant to iodine.

LABELLING

The label states that the solution should be well diluted before use.

Aqueous Iodine Oral Solution contains in 1 ml 50 mg of Iodine and about 130 mg of total iodine, free and combined.

Aqueous Iodine Oral Solution is intended to be diluted before use.

When aqueous iodine solution is prescribed or demanded, Aqueous Iodine Oral Solution shall be dispensed or supplied.

Biphasic Insulin Injection

General Notices

Biphasic Insulin

(Ph Eur monograph 0831)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Biphasic insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Biphasic insulin injection is a sterile suspension of crystals containing bovine insulin in a solution of porcine insulin.

CHARACTERS

A white or almost white suspension. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals, with a maximum dimension measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

pH *(2.2.3)*

The pH of the suspension to be examined is 6.6 to 7.2.

Insulin in the supernatant

22.0 per cent to 28.0 per cent of insulin in solution. Determine by the method described in the test for insulin in the supernatant in the monograph on *Insulin preparations, injectable (0854).*

Total zinc

26.0 µg to 37.5 µg per 100 IU of insulin. Determine by the method described in the monograph on *Insulin preparations, injectable (0854).*

Ph Eur

Biphasic Isophane Insulin Injection

General Notices

Biphasic Isophane Insulin
(Ph Eur monograph 0832)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Biphasic isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the exception of the test for Insulin in the supernatant and with the amendments prescribed below for the other tests.

DEFINITION

Biphasic isophane insulin injection is a sterile buffered suspension of either porcine or human insulin, complexed with protamine sulphate or another suitable protamine, in a solution of insulin of the same species.

PRODUCTION

Biphasic isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

Biphasic isophane insulin injection is produced by mixing, in defined ratios, soluble insulin injection and isophane insulin injection. The defined ratios shall be demonstrated by a test method which has been approved by the competent authority to comply with the label claim.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

Total zinc

Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on

Insulin preparations, injectable (0854).

LABELLING

The label states in addition to the indications mentioned in the monograph on *Insulin preparations, injectable (0854)* the ratio of soluble insulin injection to isophane insulin injection used in the manufacturing process of biphasic isophane insulin injection.

Ph Eur

Ibuprofen Cream

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Cream contains Ibuprofen in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of n-*hexane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake vigorously a quantity of the cream containing 50 mg of Ibuprofen with 10 ml of *dichloromethane* for 5 minutes and filter (Whatman GF/C paper is suitable). Solution (2) contains 0.5% w/v of *ibuprofen BPCRS* in *dichloromethane*. After removal of the plate, dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulphuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) shake vigorously a quantity of the cream containing 0.1 g of Ibuprofen with 25 ml of *methanol* for 10 minutes, decant the solution into a 50 ml graduated flask, rinse the original flask with two 10 ml quantities of *methanol*, dilute the combined solution and rinsings to 50 ml with *methanol* and filter (Whatman GF/C paper is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. For solution (3) dissolve 50 mg of *ibuprofen BPCRS* in 2.5 ml of a 0.006% w/v solution of *2-(4-butylphenyl)propionic acid EPCRS* in *methanol* (prepared by diluting 1 volume of *2-(4-butylphenyl)propionic acid EPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water* after equilibration and (c) a detection wavelength of 214 nm. Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with solution (2) is 70 to 90% of full-scale deflection on the chart paper. Record the chromatogram for 1.5 times the retention time of the principal peak.

Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes. In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(4-butylphenyl)-propionic acid is not greater than that of the peak due to 2-(4-butylphenyl) propionic acid in the chromatogram obtained with solution (3) (0.3%), the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%) and the sum of the areas of any such peaks is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%). Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake vigorously a quantity of the cream containing 50 mg of Ibuprofen with 25 ml of the mobile phase for 10 minutes, decant the solution into a 50 ml graduated flask, rinse the original flask with two 10 ml quantities of the mobile phase, dilute the combined solution and rinsings to 50 ml with the mobile phase and filter (Whatman GF/C paper is suitable). Solution (2) contains 0.1% w/v of *ibuprofen BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) a mixture of 3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 264 nm.

Calculate the content of $C_{13}H_{18}O_2$ using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

Ibuprofen Gel

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Gel is a solution of Ibuprofen in a suitable water-miscible basis.
The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of n-*hexane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake vigorously a quantity of the gel containing 0.125 g of Ibuprofen with 25 ml of *dichloromethane* for 5 minutes and use the upper layer. Solution (2) contains 0.5% w/v of *ibuprofen BPCRS* in *dichloromethane*. After removal of the plate, dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulphuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) disperse a quantity of the gel containing 0.1 g of Ibuprofen in 25 ml of warm *methanol*, cool and dilute to 50 ml with *methanol*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. For solution (3) dissolve 50 mg of *ibuprofen BPCRS* in 2.5 ml of a 0.006% w/v solution of *2-(4-butylphenyl)propionic acid EPCRS* in *methanol* (prepared by diluting 1 volume of *2-(4-butylphenyl)propionic acid EPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water* after equilibration and (c) a detection wavelength of 214 nm. Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with solution (2) is 70 to 90% of full-scale deflection on the chart paper. Record the chromatogram for 1.5 times the retention time of the principal peak.

Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes. In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(4-butylphenyl)propionic acid is not greater than that of the peak due to 2-(4-butylphenyl)-propionic acid in the chromatogram obtained with solution (3) (0.3%), the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%) and the sum of the areas of any such peaks is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%). Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the gel containing 50 mg of Ibuprofen with 50 ml of warm *methanol* for 10 minutes, cool and add sufficient *methanol* to produce 100 ml. Dilute 10 volumes of this solution to 20 volumes with the mobile phase. For solution (2) dilute 10 volumes of a solution containing 0.05% w/v of *ibuprofen BPCRS* in *methanol* to 20 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) a mixture of 3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 264 nm.

Calculate the content of $C_{13}H_{18}O_2$ using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

Ibuprofen Oral Suspension

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Oral Suspension is a suspension of Ibuprofen in a suitable flavoured vehicle.
The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing 0.5 g of Ibuprofen with 20 ml of *chloroform*, allow to stand until the layers have separated, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 1 volume of *anhydrous acetic acid*, 5 volumes of *ethyl acetate* and 15 volumes of n*-hexane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute a quantity of the oral suspension containing 0.1 g of Ibuprofen to 100 ml with *absolute ethanol*, shake vigorously for 5 minutes, filter (Whatman GF/C paper is suitable) and use the filtrate. Solution (2) contains 0.1% w/v of *ibuprofen BPCRS* in *absolute ethanol*. After removal of the plate dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulphuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). Disregard any spot remaining on the line of application.

TEST

4′-Isobutylacetophenone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions immediately after preparation. For solution (1) mix a quantity of the oral suspension containing 0.2 g of Ibuprofen with 30 ml of *acetonitrile*, add a further 10 ml of acetonitrile and 10 ml of 0.01M *orthophosphoric acid*, shake vigorously, dilute to 100 ml with 0.01M *orthophosphoric acid* and filter (Whatman GF/C paper is suitable). Solution (2) contains 0.0006% w/v of *4′-isobutylacetophenone BPCRS* in *acetonitrile*. Solution (3) contains 0.0006% w/v of *4′-isobutylacetophenone BPCRS* and 0.2% w/v of *ibuprofen BPCRS* in the

mobile phase.

The chromatographic procedure described under Assay may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to ibuprofen and 4′-isobutylacetophenone is at least 1.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 4′-isobutylacetophenone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.3%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions immediately after preparation. For solution (1) mix a quantity of the oral suspension containing 0.1 g of Ibuprofen with 30 ml of *acetonitrile*, add a further 10 ml of *acetonitrile* and 10 ml of 0.01M *orthophosphoric acid*, shake vigorously, dilute to 100 ml with 0.01M *orthophosphoric acid* and filter (Whatman GF/C paper is suitable). For solution (2) prepare a 0.1% w/v of *ibuprofen BPCRS* by dissolving a suitable quantity in 40 volumes of *acetonitrile* and adding 60 volumes of 0.01M *orthophosphoric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 400 volumes of *acetonitrile* and 600 volumes of 0.01M *orthophosphoric acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 220 nm. Inject 10 µl of each solution.

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{13}H_{18}O_2$, weight in volume, from the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

STORAGE

Ibuprofen Oral Suspension should be protected from light.

Ibuprofen Tablets

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Tablets contain Ibuprofen. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.5 g of Ibuprofen with 20 ml of *acetone*, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

B. *Melting point* of the residue obtained in test A, after recrystallisation from *petroleum spirit (boiling range, 40° to 60°)*, about 75°, Appendix V A.

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) add 30 ml of *methanol* to a quantity of the powdered tablets containing 0.2 g of Ibuprofen, shake for 30 minutes, add 30 ml of *methanol* and sufficient *water* to produce 100 ml, mix and filter through a glass microfibre filter paper (Whatman GF/C is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) dissolve 50 mg of *ibuprofen BPCRS* in 2.5 ml of a 0.006% w/v solution of *2-(4-butylphenyl)propionic acid EPCRS* in *methanol* (prepared by diluting 1 volume of *2-(4-butylphenyl)propionic acid EPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water* after equilibration and (c) a detection wavelength of 214 nm. Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with solution (2) is 70 to 90% of full-scale deflection on the chart paper. Record the chromatogram for 1.5 times the retention time of the principal peak.

Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes. In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(4-butylphenyl)propionic acid is not greater than that of the peak due to 2-(4-butylphenyl) propionic acid in the chromatogram obtained with solution (3) (0.3%), the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%) and the sum of the areas of any such peaks is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%). Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.2 g of Ibuprofen with 30 ml of the mobile phase for 30 minutes, add sufficient of the mobile phase to produce 100 ml and mix thoroughly. Centrifuge 25 ml of the solution at 2500 *g* for 5 minutes and use the supernatant liquid. Solution (2) contains 0.2% w/v of *ibuprofen BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) a mixture of 3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 264 nm.

Calculate the content of $C_{13}H_{18}O_2$ using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

Idoxuridine Eye Drops

General Notices

Action and use

Pyrimidine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Idoxuridine Eye Drops are a sterile solution of Idoxuridine in Purified Water.
Except that they may be supplied in containers not exceeding 15 ml capacity, the eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of idoxuridine, $C_9H_{11}IN_2O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dilute a suitable volume of the eye drops with 0.01M *sodium hydroxide* to produce a solution containing 0.004% w/v of Idoxuridine. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 279 nm.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak having the same retention time as the peak due to idoxuridine in the chromatogram obtained with solution (1).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.00040% w/v of *2′-deoxyuridine*, 0.00080% w/v of *5-iodouracil*, 0.00040% w/v of *5-bromo-2′-deoxyuridine* and 0.00010% w/v of *sulphanilamide* (internal standard). For solution (2) dilute a suitable volume of the eye drops with *water* to give a final concentration of 0.080% w/v of Idoxuridine. For solution (3) dilute a suitable volume of the eye drops with sufficient of a suitable solution of *sulphanilamide* to give a final concentration of 0.080% w/v of Idoxuridine and 0.00010% w/v of the internal standard.

The chromatographic conditions described under the Assay may be used but using as the mobile phase a mixture of 4 volumes of *methanol* and 96 volumes of *water*. The order of elution of the peaks following the internal standard is deoxyuridine, iodouracil, bromodeoxyuridine and idoxuridine. Several peaks due to excipients may appear in the chromatogram obtained with solution (3) before the peak due to the internal standard.

In the chromatogram obtained with solution (3) the ratios of the areas of any peaks due to 2′-deoxyuridine, 5-iodouracil and 5-bromo-2′-deoxyuridine to the area of the peak due to sulphanilamide are not greater than the ratios of the areas of the corresponding peaks in the chromatogram obtained with solution (1).

ASSAY

Prepare a solution containing 0.12 g of *sulphathiazole* (internal standard) in 10 ml of *ethanol (96%)*, warming if necessary, and dilute to 100 ml with *water* (solution A). Prepare a solution by diluting a suitable volume of the eye drops with *water* if necessary to give a final concentration of 0.10% w/v of Idoxuridine (solution B). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake 0.1 g of *idoxuridine BPCRS* with 50 ml of *water* until dissolved and then dilute to 100 ml with *water*; to 15 ml of this solution add 2 ml of solution A and dilute to 20 ml with *water*. For solution (2) add 2 ml of a 10% v/v solution of *ethanol (96%)* to 15 ml of solution B and dilute to 20 ml with *water*. For solution (3) add 2 ml of solution A to 15 ml of solution B and dilute to 20 ml with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 13 volumes of *methanol* and 87 volumes of *water* as the mobile phase with a flow rate of 1.7 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_9H_{11}IN_2O_5$ using the declared content of $C_9H_{11}IN_2O_5$ in *idoxuridine BPCRS*.

STORAGE

Idoxuridine Eye Drops should be stored at a temperature not exceeding 8° but should not be allowed to freeze.

LABELLING

The label states that the Eye Drops should not be used for continuous periods of treatment exceeding 21 days.

Ifosfamide Injection

General Notices

Action and use.

Cytotoxic alkylating agent.

DEFINITION

Ifosfamide Injection is a sterile solution of Ifosfamide in Water for Injections or a suitable liquid. It is prepared by dissolving Ifosfamide for Injection in the requisite amount of a suitable liquid immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Ifosfamide Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

IFOSFAMIDE FOR INJECTION

Ifosfamide for Injection is a sterile material consisting of Ifosfamide with or without excipients. It is supplied in a sealed container.

CAUTION Ifosfamide is Cytotoxic. Carry out the procedures described below exercising appropriate precautions.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of ifosfamide, $C_7H_{15}Cl_2N_2O_2P$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of ifosfamide (*RS 428*).

TESTS

Solution A

Dissolve 5.0 g in *carbon dioxide-free water* and dilute to 50.0 ml with the same solvent.

Appearance of solution

Solution A is clear, Appendix IV A, and not more intensely coloured than *reference solution* Y_7, Appendix IV B.

Acidity or alkalinity

pH of an 8% w/v solution, 4.0 to 7.0, Appendix V L.

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* and a mixture of 10 volumes of *water*, 15 volumes of *methanol*, 25 volumes of *acetic acid* and 50 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 15 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *methanol* and *water* to produce a solution containing 10.0% w/v of Ifosfamide. Solution (2) contains 0.025% w/v of *ifosfamide impurity A EPCRS* and 0.025% w/v of *chloroethylamine hydrochloride* (impurity C) in a mixture of equal volumes of *methanol* and *water.* Solution (3) contains 0.015% w/v of *ifosfamide impurity B EPCRS* in a mixture of equal volumes of *methanol* and *water*. Solution (4) contains 0.005% w/v of *ethanolamine,* 0.02% w/v of *ifosfamide impurity A EPCRS* and 0.08% w/v of *chloroethylamine hydrochloride* (impurity C) in a mixture of equal volumes of *methanol* and *water*. After removal of the plate, dry at 115° for 45 minutes. At the bottom of a chromatography tank, place an evaporating dish containing a 0.32% w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1% w/v solution of *tetramethylbenzidine* in *ethanol (96%)* for 5 seconds. Allow the plate to dry and examine. In the chromatogram obtained with solution (1) any spot corresponding to impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with solution (2) (0.25%); any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with solution (3) (0.15 %); any other spot is not more intense than the principal spot in the chromatogram obtained with solution (3) (0.15%). The test is not valid unless the chromatogram obtained with solution (4) shows three clearly separated spots.

B. Carry out the method for *thin-layer chromatography*, Appendix II A, using a *TLC silica gel plate* and a mixture of 1 volume of *dichloromethane* and 10 volumes of *acetone* as the mobile phase but allowing the solvent front to ascend 15 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *methanol* and *water* to produce a solution containing 2.0% w/v of Ifosfamide. Solution (2) contains 0.005% w/v of *ifosfamide impurity E EPCRS* and 0.005% w/v of *ifosfamide impurity F EPCRS* in a mixture of equal volumes of *methanol* and *water.* Solution (3) contains 0.01% w/v of *ifosfamide impurity E EPCRS* and 0.01% w/v of *ifosfamide impurity F EPCRS* in a mixture of equal volumes of *methanol* and *water.* After removal of the plate dry at 115° for 45 minutes. At the bottom of a chromatography tank, place an evaporating dish containing a 0.32% w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1% w/v solution of *tetramethylbenzidine* in *ethanol (96%)* for 5 seconds. Allow the plate to dry and examine. In the chromatogram obtained with solution (1) any spot corresponding to impurity E or impurity F is not more intense than the corresponding spot in the chromatogram obtained with solution (2) (0.25%). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

Water

Not more than 0.5% w/w, Appendix IX C. Use 1g.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations, Powders for Injections.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a sufficient quantity of the contents of the sealed container to produce a solution containing 0.060% w/v of Ifosfamide.

(2) 0.060% w/v of *ifosfamide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax SB-C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 195 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

A mixture of 30 volumes of *acetonitrile R1* and 70 volumes of *carbon dioxide-free water.*

DETERMINATION OF CONTENT

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in a container of average content weight using the declared content of $C_7H_{15}Cl_2N_2O_2P$ in *ifosfamide BPCRS*.

STORAGE

The sealed container should be kept protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ifosfamide. Related substances test A is intended to control degradation impurities and Related substances test B is intended to control synthetic impurities.

Imipramine Tablets

General Notices

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Imipramine Tablets contain Imipramine Hydrochloride. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of imipramine hydrochloride, $C_{19}H_{24}N_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Triturate a quantity of the powdered tablets containing 0.25 g of Imipramine Hydrochloride with 10 ml of *chloroform*, filter, evaporate the filtrate to low volume, add *ether* until a turbidity is produced and allow to stand. The precipitate complies with the following tests.

A. *Melting point*, after recrystallisation from *acetone*, about 172°, Appendix V A.

B. Dissolve 5 mg in 2 ml of *nitric acid*. An intense blue colour is produced.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 5 volumes of *hydrochloric acid*, 5 volumes of *water*, 35 volumes of *glacial acetic acid* and 55 volumes of *ethyl acetate* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions prepared immediately before use. For solution (1) shake a quantity of the powdered tablets containing 0.20 g of Imipramine Hydrochloride with three 10 ml quantities of *chloroform*, filter the combined chloroform extracts, evaporate to dryness and dissolve the residue in 10 ml of *methanol*. For solution (2) dilute 3 volumes of solution (1) to 100 volumes with *methanol* and dilute 1 volume of the resulting solution to 10 volumes with *methanol*. Solution (3) contains 0.0060% w/v of *iminodibenzyl* in *methanol*. After removal of the plate, allow it to dry for 5 minutes, spray with a 0.5% w/v solution of *potassium dichromate* in *sulphuric acid (20%)* and examine immediately. In the chromatogram obtained with solution (1) any spot corresponding to iminodibenzyl is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%).

ASSAY

Powder 10 tablets and transfer quantitatively without loss into 300 ml of 0.1M *hydrochloric acid*. Shake for 30 minutes, add sufficient 0.1M *hydrochloric acid* to produce 500 ml and filter through a fine glass microfibre filter (GF/C paper is suitable). Dilute a suitable volume of the filtrate with 0.1M *hydrochloric acid* to produce a solution containing 0.0025% w/v of Imipramine Hydrochloride and measure the *absorbance* of the resulting solution at the maximum at 250 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2$,HCl taking 264 as the value of *A* (1%, 1 cm) at the maximum at 250 nm.

Indapamide Tablets

General Notices

Action and use

Thiazide-like diuretic.

DEFINITION

Indapamide Tablets contain Indapamide. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of indapamide hemihydrate, $C_{16}H_{16}ClN_3O_3S,½H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* F_{254} *plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) grind a quantity of the powdered tablets containing 50 mg of Indapamide with 10 ml of *acetone*, mix for 15 minutes, filter through a fine filter paper (Whatman 42 is suitable) and use the filtrate. Solution (2) contains 0.5% w/v of *indapamide EPCRS* in *acetone*. After removal of the plate, allow it to dry until the solvent has evaporated and examine under *ultraviolet light (254 nm)*. Spray the plate with a solution prepared by mixing 10 volumes of *potassium iodobismuthate solution* and 20 volumes of *glacial acetic acid* and diluting to 100 volumes with *water* and examine again. Finally, spray the plate with a 5% w/v solution of *sodium nitrite* in a mixture of equal volumes of *water* and *ethanol (96%)* and examine again. By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) is similar in position, colour and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of 0.1M *hydrochloric acid* and rotate the paddle at 100 revolutions per minute. After 60 minutes, withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, suitably diluted with 0.1M *hydrochloric acid* if necessary, at 240 nm and at 275 nm using 0.1M *hydrochloric acid* in the reference cell. Prepare a reference solution by diluting 1 volume of a 0.10% w/v solution of *indapamide EPCRS* in *methanol* to 200 volumes with 0.1M *hydrochloric acid* and measure the *absorbance* of this solution at 240 nm and at

275 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of indapamide hemihydrate, $C_{16}H_{16}ClN_3O_3S,½H_2O$, in the medium using the differences in absorbance at 240 nm and at 275 nm and using the declared content of $C_{16}H_{16}ClN_3O_3S$ in *indapamide EPCRS*. Each mg of $C_{16}H_{16}ClN_3O_3S$ is equivalent to 1.0246 mg of $C_{16}H_{16}ClN_3O_3S,½H_2O$. The amount of indapamide hemihydrate released is not less than 75% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) mix 10 whole tablets with 70 ml of *ethanol (96%)*, mix mechanically until the tablets have disintegrated and continue mixing for 2 hours. Add sufficient *ethanol (96%)* to produce 100 ml, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide. For solution (2) dilute 1 volume of solution (1) to 10 volumes with the mobile phase and further dilute 1 volume of this solution to 100 volumes with the mobile phase. For solution (3) dilute 1 volume of a 0.00025% w/v solution of *indapamide impurity B EPCRS* in *ethanol (96%)* to 10 volumes with the mobile phase. For solution (4) dilute 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* to 10 volumes with the mobile phase. For solution (5) mix one volume of solution (1), one volume of a 0.00025% w/v solution of *indapamide impurity B EPCRS* in *ethanol (96%)* and 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* and add 7 volumes of the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.6 ml per minute a mixture of 6 volumes of a solution containing 5% w/v of *sodium dodecyl sulphate* and 3% v/v of *glacial acetic acid*, 10 volumes of *triethylamine*, 20 volumes of *butan-2-ol*, 310 volumes of *acetonitrile* and 690 volumes of *water*, the mixture being adjusted to pH 3.0 with *orthophosphoric acid* and (c) a detection wavelength of 240 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the retention time of impurity B relative to indapamide is about 1.7 and the retention time of 4-chloro-3-sulfamoylbenzoic acid relative to indapamide is about 0.3.

In the chromatogram obtained with solution (1), the area of any peak corresponding to indapamide impurity B is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.5%), the area of any peak corresponding to 4-chloro-3-sulfamoylbenzoic acid is not greater than 0.4 times the area of the peak in the chromatogram obtained with solution (4) (0.2%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.1%). The sum of the content of impurities, excluding indapamide impurity B, is not greater than 0.3%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) mix 10 whole tablets with 70 ml of *ethanol (96%)*, mix mechanically until the tablets have disintegrated and continue mixing for 2 hours. Add sufficient *ethanol (96%)* to produce 100 ml, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide. For solution (2) dilute 1 volume of a 0.025% w/v solution of *indapamide EPCRS* in *ethanol (96%)* to 5 volumes with the mobile phase.

The chromatographic procedure described under Related substances may be used.

Calculate the content of $C_{16}H_{16}ClN_3O_3S,½H_2O$ in the tablets from the chromatogram obtained and using the declared content of $C_{16}H_{16}ClN_3O_3S$ in *indapamide EPCRS*. Each mg of

$C_{16}H_{16}ClN_3O_3S$ is equivalent to 1.0246 mg of $C_{16}H_{16}ClN_3O_3S,\frac{1}{2}H_2O$.

STORAGE

Indapamide Tablets should be protected from light.

Indometacin Capsules

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Indometacin Capsules contain Indometacin.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of indometacin, $C_{19}H_{16}ClNO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 0.1 g of Indometacin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of indometacin *(RS 187)*.

B. The *light absorption*, Appendix II B, in the range 300 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 320 nm.

C. Mix a quantity of the contents of the capsules containing 25 mg of Indometacin with 2 ml of *water* and add 2 ml of 2M *sodium hydroxide*. A bright yellow colour is produced which fades rapidly.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *phosphate buffer pH 7.2* and rotate the paddle at 50 revolutions per minute. Withdraw a 10 ml sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 320 nm, Appendix II B, using *phosphate buffer pH 7.2* in the reference cell. Calculate the total content of indometacin, $C_{19}H_{16}ClNO_4$, in the medium taking 196 as the value of A(1%, 1 cm) at the maximum at 320 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a suspension of *silica gel* HF_{254} in a 4.68% w/v solution of *sodium dihydrogen orthophosphate* to coat the plate and a mixture of 70 volumes of *ether* and 30 volumes of *petroleum spirit (boiling range, 60° to 80°)* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.10 g of Indometacin with 5 ml of *chloroform*, filter and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

To a quantity of the mixed contents of 20 capsules containing 50 mg of Indometacin add 10 ml of *water* and allow to stand for 10 minutes, swirling occasionally. Add 75 ml of *methanol*, shake well, add sufficient *methanol* to produce 100 ml and filter if necessary. To 5 ml of the filtrate add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100 ml. Measure the *absorbance* of the resulting solution at the maximum at 320 nm, Appendix II B. Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the value of A(1%, 1 cm) at the maximum at 320 nm.

Indometacin Suppositories

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Indometacin Suppositories contain Indometacin in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of indometacin, $C_{19}H_{16}ClNO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the suppositories containing 0.1 g of Indometacin as completely as possible in 50 ml of hot *water*, filter, wash the residue with hot *water* and allow to dry in air. Dissolve the residue in 5 ml of *chloroform* and evaporate to dryness. The *infrared absorption spectrum* of the final residue, Appendix II A, is concordant with the *reference spectrum* of indometacin *(RS 187)*.

B. Shake a quantity of the suppositories containing 25 mg of Indometacin with 5 ml of *water* until the basis dissolves; a white suspension is produced. Add 2 ml of 2M *sodium hydroxide*; a bright yellow colour is produced which fades rapidly.

TESTS

Disintegration

Carry out the *disintegration test for suppositories and pessaries*, Appendix XII A2, using a weighed suppository and *phosphate buffer pH 6.8* in place of *water* and operating the apparatus for 90 minutes. At the end of this period remove the suppository, dry with filter paper and weigh. Repeat the operation with two further weighed suppositories. Not less than 75% of each suppository is dissolved.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. For solution (1) dilute 3 volumes of solution (2) to 100 volumes with the mobile phase. For solution (2) powder or cut into small pieces a suitable number of the suppositories, dissolve a quantity containing 0.1 g of Indometacin in sufficient *methanol* to produce 50 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 40 volumes of 0.2% v/v solution of *orthophosphoric acid* and 60 volumes of *methanol* as the mobile phase with a flow rate of 2 ml per minute and (c) a

detection wavelength of 320 nm.

The *column efficiency*, determined using the principal peak in the chromatogram obtained with solution (1), should be not less than 7500 theoretical plates per metre.

The sum of the areas of any *secondary peaks* that elute before the principal peak in the chromatogram obtained with solution (2) is not greater than the area of the peak in the chromatogram obtained with solution (1).

Repeat the procedure but using the following freshly prepared solutions and a detection wavelength of 240 nm. For solution (3) dilute 10 volumes of solution (2) to 20 volumes with the mobile phase. Solution (4) contains 0.001% w/v of *4-chlorobenzoic acid* in the mobile phase. In the chromatogram obtained with solution (3) the sum of the areas of any *secondary peaks* that elute before the principal peak, other than those determined in solution (2), is not greater than the area of the peak in the chromatogram obtained with solution (4).

ASSAY

Weigh 10 suppositories and powder or cut into small pieces. To a quantity containing 0.1 g of Indometacin add 50 ml of *methanol*, shake until dispersion is complete and, if necessary, filter. To 2 ml add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100 ml. Measure the *absorbance* of the resulting solution at the maximum at 318 nm, Appendix II B. Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the value of A (1%, 1 cm) at the maximum at 318 nm.

Indoramin Tablets

General Notices

Action and use

Alpha$_1$-adrenoceptor antagonist.

DEFINITION

Indoramin Tablets contain Indoramin Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of indoramin, $C_{22}H_{25}N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of indoramin with 25 ml of *water* for 5 minutes, filter (Whatman GF/C paper is suitable), make the filtrate alkaline with 2M *sodium hydroxide* and extract with 20 ml of *dichloromethane.* Wash the extracts with two 10 ml quantities of *water*, dry by shaking with *anhydrous sodium sulphate* and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of indoramin *(RS 188).*

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of 18M *ammonia,* 20 volumes of *absolute ethanol* and 79 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add 10 ml of *ethanol (96%)* to a quantity of the powdered tablets containing the equivalent of 0.1 g of indoramin, shake for 30 minutes and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *ethanol (96%).* For solution (3) dilute 1 volume of solution (2) to 5 volumes with *ethanol (96%).* After removal of the plate, allow it to dry in a current of warm air and examine it under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.1%). Disregard any spot remaining on the line of application.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use 900 ml of 0.1M *hydrochloric acid* as the medium and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 280 nm, Appendix II B. Calculate the total content of indoramin, $C_{22}H_{25}N_3O$, in the medium taking 186 as the value of A(1%, 1 cm) at the maximum at 280 nm.

ASSAY

Shake 10 whole tablets with 50 ml of 0.1M *hydrochloric acid* until the tablets have disintegrated, add 300 ml of *ethanol (96%)* and mix with the aid of ultrasound for 10 minutes, shaking occasionally. Add sufficient *ethanol (96%)* to produce 500 ml, filter (Whatman GF/C paper is suitable), dilute the filtrate with *ethanol (96%)* to contain 0.005% w/v of indoramin and measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of $C_{22}H_{25}N_3O$ taking 186 as the value of A(1%, 1 cm) at the maximum at 280 nm.

STORAGE

Indoramin Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of indoramin.

Injectable Insulin Preparations

General Notices

Insulin Preparations

(Ph Eur monograph 0854)

For preparations of Human Insulin, the label states the approved code in lower case letters indicative of the method of production.

The provisions of this monograph apply to sterile preparations of Human Insulin and its analogues, Bovine Insulin and Porcine Insulin.

The provisions of this monograph apply to the Injectable Insulin Preparations listed below.

Preparations

Biphasic Insulin Injection

Biphasic Isophane Insulin Injection

Insulin Injection

Insulin Aspart Injection

Insulin Lispro Injection

Insulin Zinc Suspension

Insulin Zinc Suspension (Amorphous)

Insulin Zinc Suspension (Crystalline)

Isophane Insulin Injection

Protamine Zinc Insulin Injection

Ph Eur

Injectable insulin preparations comply with the requirements for Injections prescribed in the monograph on Parenteral preparations (0520).

DEFINITION

Injectable insulin preparations are sterile preparations of *Insulin, human (0838)*, *Insulin, bovine (1637)* or *Insulin, porcine (1638)*. They contain not less than 90.0 per cent and not more than the equivalent of 110.0 per cent of the amount of insulin stated on the label. They are either solutions or suspensions or they are prepared by combining solutions and suspensions.

PRODUCTION

The methods of preparation are designed to confer suitable properties with respect to the onset and duration of therapeutic action.

The following procedures are carried out in a suitable sequence, depending on the method of preparation:

- addition of suitable antimicrobial preservatives;
- addition of a suitable substance or substances to render the preparation isotonic with blood;
- addition of a suitable substance or substances to adjust the pH to the appropriate value;
- determination of the strength of the insulin-containing component or components followed, where necessary, by adjustment so that the final preparation contains the requisite number of International Units per millilitre;
- sterilisation by filtration of the insulin-containing component or components; once this procedure has been carried out all subsequent procedures are carried out aseptically using materials that have been sterilised by a suitable method.

In addition, where appropriate, suitable substances are added and suitable procedures carried out to confer the appropriate physical form on the insulin-containing component or components. The final preparation is distributed aseptically into sterile containers which are closed so as to exclude microbial contamination.

TESTS

pH *(2.2.3)*

The pH of the solution or suspension is 6.9 to 7.8, unless otherwise prescribed in the specific monograph.

Insulin in the supernatant

For injectable insulin preparations that are suspensions, not more than 2.5 per cent of the total insulin content, unless otherwise stated. Centrifuge 10 ml of the suspension at 1500 g for 10 min and carefully separate the supernatant liquid and the residue. Determine the insulin content of the supernatant liquid (*S*) by a suitable method, for example using the chromatographic conditions described under Assay. Calculate the percentage of the insulin in solution from the expression:

$$\frac{100S}{T}$$

where T is the total insulin content determined as described under the Assay.

Impurities with molecular masses greater than that of insulin

Examine by size-exclusion chromatography *(2.2.30)*.

Test solution Add 4 µl of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear acid insulin solution. When sampling a suspension, agitate the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of hydrochloric acid, add small aliquots of acid (less than 4 µl per millilitre) until a solution is obtained. Preparations with concentrations higher than 100 IU/ml need to be diluted with *0.01 M hydrochloric acid* to avoid overloading the column with insulin monomer.

Resolution solution Use a solution of insulin (approximately 4 mg/ml), containing more than

0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about ten days.

Maintain the solutions at 2 °C to 10 °C and use within 30 h (soluble insulin injection) or 7 days (other insulin preparations). If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

— a column 0.3 m long and at least 7.5 mm in internal diameter packed with hydrophilic silica gel for chromatography R (5 µm to 10 µm), of a grade suitable for the separation of insulin monomer from dimers and polymers;

— as mobile phase at a flow rate of 0.5 ml/min a mixture consisting of 15 volumes of glacial acetic acid R, 20 volumes of acetonitrile R and 65 volumes of a 1.0 g/l solution of arginine R; filter and degas;

— as detector a spectrophotometer set at 276 nm.

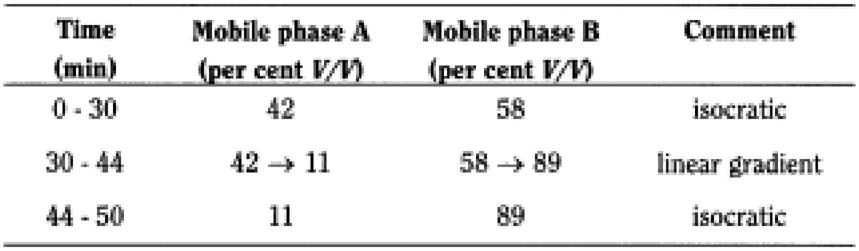
Equilibration of the column Before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least three injections of the resolution solution. The column is equilibrated when repeatable results are obtained from two subsequent injections. If protamine-containing samples are to be analysed, the equilibration of the column is performed using a solution containing protamine.

Inject 100 µl of the resolution solution. When the chromatograms are recorded under the prescribed conditions, the retention times are: polymeric insulin complexes or covalent insulin-protamine complex: about 13 min to 17 min, covalent insulin dimer: about 17.5 min, insulin monomer: about 20 min, salts: about 22 min. If the sample solution contains preservatives, for example methyl paraben, m-cresol or phenol, these compounds elute later. The test is not valid unless the resolution, defined by the ratio of the height of the dimer peak to the height above the baseline of the valley separating the monomer and dimer peaks, is at least 2.0.

Inject 100 µl of the test solution. Record the chromatogram for approximately 35 min. In the chromatogram obtained, the sum of the areas of any peak with a retention time less than that of the insulin peak is not greater than 3.0 per cent (protamine containing preparations) or 2.0 per cent (non-protamine containing preparations) of the total area of the peaks. Disregard any peak with a retention time greater than that of the insulin peak.

Related proteins

Examine by liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below:



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 30	42	58	isocratic
30 - 44	42 → 11	58 → 89	linear gradient
44 - 50	11	89	isocratic

Maintain the solutions at 2 °C to 10 °C and use within 24 h. Perform a system suitability check (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of the test solution and 20 µl of either reference solution (a), for insulin preparations containing 100 IU/ml, or reference solution (b), for insulin preparations containing 40 IU/ml. If necessary, adjust the injection volume to a volume between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. If necessary, make further adjustments to the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show a shorter retention time. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. In the chromatogram obtained with either reference solution (a), or reference solution (b), as appropriate, A21 desamido insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak, due to insulin. In the chromatogram obtained with the test solution the area of the peak due to A21 desamido insulin is not greater than 5.0 per cent of the total area of the peaks; the sum of the areas of any other peaks, apart from those due to insulin and A21 desamido insulin is not greater than 6.0 per cent of the total area of the peaks. Disregard the peaks due to the preservatives and protamine (early eluting peaks).

Total zinc

Not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Use the following method, unless otherwise prescribed in the specific monograph.

Test solution Shake the preparation gently and dilute a volume containing 200 IU of insulin to 25.0 ml with *0.01 M hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Zinc in solution

Where applicable, not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Centrifuge the preparation to be examined and dilute 1 ml of the clear supernatant liquid obtained to 25.0 ml with *water R*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

Reference solutions Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins *(2.6.14)*

Less than 80 IU per 100 IU of insulin.

ASSAY

Examine by liquid chromatography *(2.2.29)*.

Test solution Add 4 µl of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear solution. When sampling a suspension, shake the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of acid, add small aliquots of acid (less than 4 µl per millilitre) until a solution is obtained. For a preparation containing more than 100 IU ml, an additional dilution with *0.01 M hydrochloric acid* is necessary to avoid overloading the column.

Reference solution (a) For a preparation containing a single species of insulin, dissolve in *0.01 M hydrochloric acid*, as appropriate, the contents of a vial of *human insulin CRS*, *porcine insulin CRS* or *bovine insulin CRS* to obtain a concentration of 4.0 mg/ml. For a preparation containing both bovine and porcine insulins, mix 1.0 ml of a solution containing 4.0 mg of *bovine insulin CRS* per millilitre of *0.01 M hydrochloric acid* and 1.0 ml of a solution containing 4.0 mg of *porcine insulin CRS* per millilitre of *0.01 M hydrochloric acid*. *Reference solution (a) is used for the assay of insulin preparations containing 100 IU/ml*.

Reference solution (b) Dilute 4.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid*. *Reference solution (b) is used for the assay of insulin preparations containing 40 IU/ml*.

Reference solution (c) Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (d) Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (e) Dilute 1.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (f) Dilute 1.0 ml of reference solution (b) to 10.0 ml with *0.01 M hydrochloric acid*.

Resolution solution Mix 1.0 ml of reference solution (c) and 1.0 ml of reference solution (d).

Maintain the solutions at 2 °C to 10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm);

— as mobile phase at a flow rate of 1 ml/min the following solutions prepared and maintained at a temperature not lower than 20 °C:

Mobile phase A Dissolve 28.4 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000 ml with the same solvent; add 2.7 ml of *phosphoric acid R*; adjust the pH to 2.3, if necessary, with *ethanolamine R*; filter and degas;

Mobile phase B Mix 550 ml of mobile phase A with 450 ml of *acetonitrile R*. Warm the solution to a temperature not lower than 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas;

— as detector a spectrophotometer set at 214 nm;

maintaining the temperature of the column at 40 °C.

Elute with a mixture of 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusted if necessary.

Inject 20 µl of the resolution solution and 20 µl of reference solution (d). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (d) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.

Inject 20 µl of the test solution and 20 µl of either reference solutions (a) and (e), for insulin preparations containing 100 IU/ml, or 20 µl of reference solutions (b) and (f), for insulin preparations containing 40 IU/ml. If necessary, make further adjustments of the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show shorter retention times. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution wash the column with a mixture of equal volumes of *acetonitrile R* and *water R* for a sufficient time to ensure elution of any interfering substances before injecting the next solution. The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) or (b) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) or (f). If this test fails, adjust the injection volume between 10 µl and 20 µl, in order to be in the linearity range of the detector.

Calculate the content of insulin plus A21 desamido insulin from the area of the peak due to the bovine, porcine or human insulin and that of any peak due to the A21 desamido insulin, using the declared content of insulin plus A21 desamido insulin in *bovine insulin CRS*, *porcine insulin CRS* or *human insulin CRS* , as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of the peaks due to the A21 desamido insulin(1) derivatives.

STORAGE

Unless otherwise prescribed, store in a sterile, airtight, tamper-proof container, protected from light, at a temperature of 2 °C to 8 °C. Insulin preparations are not to be frozen.

LABELLING

The label states:

— the potency in International Units per millilitre;

— the concentration in terms of the number of milligrams of insulin per millilitre (for preparations containing both bovine insulin and porcine insulin the concentration is stated as the combined amount of both insulins);

— where applicable, that the substance is produced by enzymatic modification of porcine insulin;

— where applicable, that the substance is produced by recombinant DNA technology;

— where applicable, the animal species of origin;

— that the preparation must not be frozen;

— where applicable, that the preparation must be resuspended before use.

Ph Eur

[1] 100 IU are equivalent to 3.47 mg of human insulin, to 3.45 mg of porcine insulin, and to 3.42 of bovine insulin.

Inositol Nicotinate Tablets

General Notices

Action and use

Vasodilator.

DEFINITION

Inositol Nicotinate Tablets contain Inositol Nicotinate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of inositol nicotinate, $C_{42}H_{30}N_6O_{12}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 1 g of Inositol Nicotinate with 30 ml of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of inositol nicotinate *(RS 190)*. Retain the remainder of the residue for use in the Related substances test.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, diluted with 1M *hydrochloric acid* if necessary, at the maximum at 262 nm using 1M *hydrochloric acid* in the reference cell. Calculate the total content of inositol nicotinate, $C_{42}H_{30}N_6O_{12}$, in the medium taking 398 as the value of A(1%, 1 cm) at the maximum at 262 nm.

Free nicotinic acid

To a quantity of the powdered tablets containing 1 g of Inositol Nicotinate add 75 ml of water, shake for 15 minutes and titrate with 0.02M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Not more than 1.0 ml of 0.02M *sodium hydroxide VS* is required to produce the first pink colour.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a plate 200 mm × 200 mm in size and *silica gel* GF_{254} as the coating substance. For the first development use a mixture of 10 volumes of *methanol* and 90 volumes of *chloroform* as the mobile phase. Apply to the bottom right-hand corner of the plate 5 µl of solution (1) containing 5.0% w/v of the residue obtained in test A for Identification in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform* and develop over a path of 12 cm. After removal of the plate, allow it to dry in air and turn the plate through 90° in a clockwise direction. Apply separately to the bottom right-hand corner of the plate, and to the right of the solvent front, 5 µl of each of two solutions of the residue obtained in test A for Identification in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform* containing (2) 0.075% w/v and (3) 0.050% w/v, respectively. For the second development use a mixture of 5 volumes each of *glacial acetic acid*, *ethanol (96%)* and *water* and 50 volumes of *ethyl acetate* as the mobile phase. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 0.25 g of Inositol Nicotinate add 50 ml of *anhydrous acetic acid*, heat to boiling and allow to cool. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using *1-naphtholbenzein solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 13.51 mg of $C_{42}H_{30}N_6O_{12}$.

Insulin Aspart Injection

General Notices

Action and use

Hormone; treatment of diabetes mellitus.

DEFINITION

Insulin Aspart Injection is a sterile, neutral, aqueous solution of Insulin Aspart.
The injection complies with the requirements stated under Insulin Preparations with the modifications described below.

Content of insulin aspart, $C_{256}H_{381}N_{65}O_{79}S_6$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless liquid, free from turbidity and foreign matter; during storage traces of a very fine sediment may be deposited.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related proteins

Carry out the method for *liquid chromatography,* Appendix III D, as described under Assay using the *normalisation procedure*.

LIMITS

In the chromatogram obtained with solution (1), the area of the peak corresponding to B28isoAsp insulin aspart is not more than 2.5%, the total area of the peaks corresponding to A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart is not more than 5%, and the total area of other peaks corresponding to impurities is not more than 3.5%.

Total zinc

Not more than 40 µg per 100 units of insulin aspart, determined by *atomic absorption spectrometry*, Appendix II D Method I.

Test solution Shake the preparation gently and dilute a volume containing 100 units of insulin aspart to 25.0 ml with 0.01M *hydrochloric acid*. Dilute, if necessary, to a suitable concentration of zinc (for example 0.1 µg to 1.0 µg of Zn per millilitre) with 0.01M *hydrochloric acid*.

Reference solutions Use solutions containing a suitable range of concentrations, for example 0.20 µg, 0.40 µg, 0.60 µg, 0.80 µg and 1.00 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn)* with 0.01M *hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 80 IU of endotoxin per 100 units of insulin aspart.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to produce a solution containing 0.4% w/v insulin aspart. Add 4µl of 6M *hydrochloric acid* per ml to this solution to obtain a clear acid solution. Maintain the solution at 2° to 8° and use within 48 hours.

(2) Dissolve the contents of a vial of *insulin aspart EPCRS* in 0.01M *hydrochloric acid* to produce a solution containing 0.4% w/v insulin aspart. Maintain the solution at 2° to 8° and use within 48 hours.

(3) Use an appropriate solution with a content of B3Asp insulin aspart and A21Asp insulin aspart of not less than 1%. This may be achieved by storing solution (2) at room temperature for 1 to 3 days. Maintain the solution at 2° to 8° and use within 72 hours.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Gradient elution using the mobile phases described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 35°.

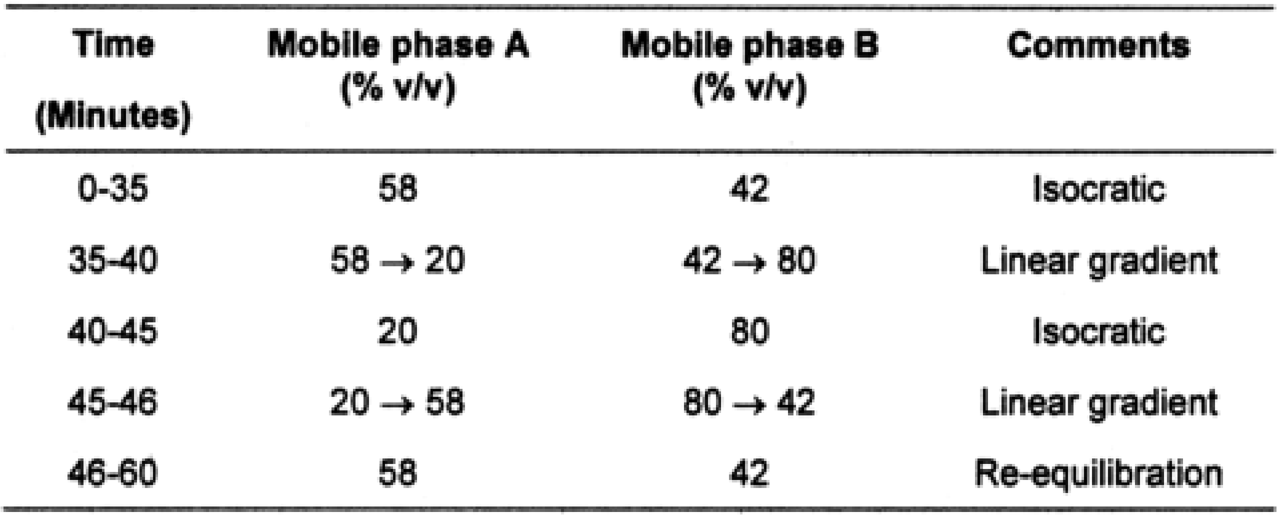
(e) Detection wavelength of 214 nm.

(f) An injection volume of 10 µl for each solution.

MOBILE PHASE

Mobile phase A Dissolve 70 g of *anhydrous sodium sulphate* in approximately 4500 ml of *water*; add 6.5 ml of *orthophosphoric acid* and adjust to pH 3.4, if necessary, with *dilute sodium hydroxide solution.* Dilute to 5000 ml with *water*; filter and degas. Mix 9 volumes of the solution with 1 volume of *acetonitrile for chromatography*.

Mobile phase B Mix equal volumes of *water* and *acetonitrile for chromatography*.



Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0-35	58	42	Isocratic
35-40	58 → 20	42 → 80	Linear gradient
40-45	20	80	Isocratic
45-46	20 → 58	80 → 42	Linear gradient
46-60	58	42	Re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retention times with reference to insulin aspart (retention time, 20 to 26 minutes) are: B28isoAsp insulin aspart, approximately 0.9; B3Asp insulin aspart plus A21Asp insulin aspart (generally co eluted), approximately 1.3; B3isoAsp insulin aspart, approximately 1.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peak due to insulin aspart and the peak due to A21Asp insulin aspart plus B3Asp insulin aspart is greater than 1.6.

The test is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is less than 1.8.

DETERMINATION OF CONTENT

Calculate the content of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$, together with the content of B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart using the areas of the corresponding peaks in the chromatograms obtained with solution (1) and solution (2) and the declared content of insulin aspart together with the content of B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart(1) in *insulin aspart EPCRS*.

LABELLING

The label states the potency in units per ml.

[1] 100 units are equivalent to 3.50 mg of insulin aspart.

Insulin Injection

General Notices

Neutral Insulin; Neutral Insulin Injection; Soluble Insulin
(Soluble Insulin Injection, Ph Eur monograph 0834)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Soluble insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Soluble insulin injection is a neutral, sterile solution of bovine, porcine or human insulin.

CHARACTERS

A colourless liquid, free from turbidity and foreign matter; during storage, traces of a very fine sediment may be deposited.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

Total zinc

Not more than 40.0 µg per 100 IU of insulin.

Determine by the method described in the monograph on *Insulin preparations, injectable (0854).*

Use the following test solution.

Test solution Dilute a volume of the gently shaken preparation containing 200 IU to 25.0 ml with *water R*. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

Ph Eur

Insulin Lispro Injection

General Notices

Action and use

Hormone; treatment of diabetes mellitus.

DEFINITION

Insulin Lispro Injection is a sterile, aqueous solution of Insulin Lispro.

The injection complies with the requirements stated under Insulin Preparations, with the exception of the test for Insulin in the supernatant, and with the modifications described below.

Content of insulin lispro, $C_{257}H_{383}N_{65}O_{77}S_6$

90.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear and colourless solution, free from turbidity and foreign matter.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Impurities with molecular masses greater than that of insulin lispro

The sum of the areas of the peaks in the chromatogram obtained with the test solution with a retention time less than that of the principal peak is not more than 1.5% of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin lispro monomer.

Related proteins

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to produce a solution containing 0.35% w/v of Insulin Lispro. Add 4 µl of 6M *hydrochloric acid* per ml of this solution. Maintain the solution at 2° to 8° and use within 56 hours.

(2) Prepare a 0.35% w/v solution of Insulin Lispro in 0.01M *hydrochloric acid* and add 4 µl of 6M *hydrochloric acid* per ml. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% of A21 desamido insulin lispro.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for* *chromatography* (5 µm) with a pore size of 30 nm (Vydac Protein and Peptide C18 is suitable).

(b) Gradient system using the mobile phases described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 214 nm.

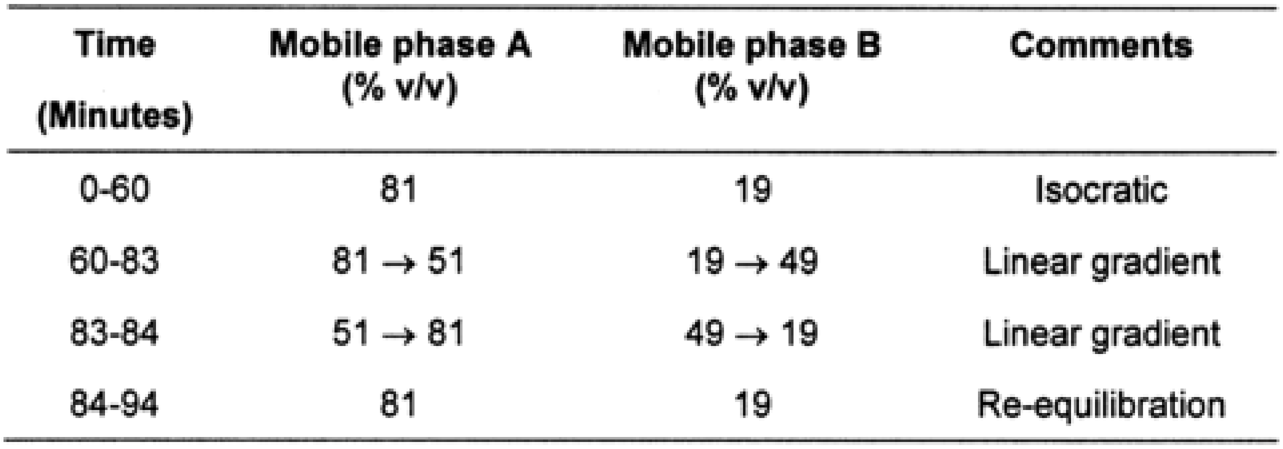
(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

Mobile phase A Mix 82 volumes of a 2.84% w/v solution of *anhydrous sodium sulphate* adjusted to pH 2.3 with *orthophosphoric acid* and 18 volumes of *acetonitrile for chromatography*.

Mobile phase B Mix equal volumes of a 2.84% w/v solution of *anhydrous sodium sulphate,* adjusted to pH 2.3 with *orthophosphoric acid ,* and *acetonitrile for chromatography*.

Use the following gradient.



Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0-60	81	19	Isocratic
60-83	81 → 51	19 → 49	Linear gradient
83-84	51 → 81	49 → 19	Linear gradient
84-94	81	19	Re-equilibration

SYSTEM SUITABILITY

Adjust the mobile phase composition to obtain a retention time of about 41 minutes for insulin lispro; A21 desamido insulin lispro elutes near the start of the gradient elution. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the first peak (insulin lispro) and the second peak (A21 desamido insulin lispro) is at least 1.5 and the *symmetry factor* for the peak due to insulin lispro is less than 2.0.

LIMITS

In the chromatogram obtained with solution (1), the amount of A21 desamido insulin lispro is not more than 1.5%, and that of any other impurity is not greater than 0.5% by *normalisation.* The total amount of related proteins (excluding A21) is not greater than 4.0%.

Total zinc

14 to 35 µg per 100 units of insulin lispro, determined by *atomic absorption spectrometry*, Appendix II D, Method I.

Test solution Shake the preparation gently and dilute a volume containing 200 units of insulin lispro to 25.0 ml with 0.01M *hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per ml) with 0.01M *hydrochloric acid*.

Reference solutions Use solutions containing a suitable range of concentrations, for example 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per ml, freshly prepared by diluting *zinc standard solution (5 mg per ml Zn)* with 0.01M *hydrochloric acid.*

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 80 IU of endotoxin per 100 units of insulin lispro.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to obtain a 0.08% w/v solution. Add 4 µl of 6M *hydrochloric acid* per ml of this solution. Maintain the solution at 2 to 8° and use within 48 hours.

(2) Dissolve the contents of a vial of *insulin lispro EPCRS* in 0.01M *hydrochloric acid* to obtain a 0.08% w/v solution. Maintain the solution at 2° to 8° and use within 48 hours.

(3) Prepare a 0.1% w/v solution of the preparation being examined in 0.01M *hydrochloric acid* and add 4 µl of 6M *hydrochloric acid* per ml. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% of A21 desamido insulin lispro. Maintain the solution at 2° to 8° and use within 14 days.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (10 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.8 ml per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 214 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

Mix 255 volumes of *acetonitrile for chromatography* and 745 volumes of a 2.84% w/v solution of *anhydrous sodium sulphate* adjusted to pH 2.3 with *orthophosphoric acid*.

SYSTEM SUITABILITY

When the chromatograms are recorded in the prescribed conditions, the retention time of insulin lispro is approximately 24 minutes. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (insulin lispro) and the second peak (A21 desamido insulin lispro), is greater than 1.8, and the maximum relative standard deviation for replicate injections is 1.1% after 3 injections.

DETERMINATION OF CONTENT

Calculate the content of insulin lispro $C_{257}H_{383}N_{65}O_{77}S_6$ from the chromatograms obtained and the declared content of $C_{257}H_{383}N_{65}O_{77}S_6$(1) in *insulin lispro EPCRS*.

LABELLING

The label states the potency in units per ml.

---

[1] 100 IU are equivalent to 3.47 mg of insulin lispro.

Insulin Zinc Suspension (Amorphous)

General Notices

(Insulin Zinc Injectable Suspension (Amorphous), Ph Eur monograph 0835)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Insulin zinc injectable suspension (amorphous) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension (amorphous) is a sterile neutral suspension of bovine, porcine or human insulin complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Total zinc

0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854).*

Zinc in solution

20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854).*

Ph Eur

Insulin Zinc Suspension (Crystalline)

General Notices

(Insulin Zinc Injectable Suspension (Crystalline), Ph Eur monograph 0836)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Insulin zinc injectable suspension (crystalline) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension (crystalline) is a sterile neutral suspension of bovine, porcine or human insulin, complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rhombohedral crystals, the majority having a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Insulin not extractable with buffered acetone solution

Not less than 90 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant liquid. Suspend the residue in 1.65 ml of *water R*, add 3.3 ml of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant liquid and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 ml. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

Total zinc

0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854).*

Zinc in solution

20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854).*

Ph Eur

Insulin Zinc Suspension

General Notices

Insulin Zinc Suspension, Mixed

(Insulin Zinc Injectable Suspension, Ph Eur monograph 0837)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Insulin zinc injectable suspension complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension is a sterile neutral suspension of bovine insulin and/or porcine insulin or of human insulin with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

PRODUCTION

Insulin zinc injectable suspension is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854).*

Insulin zinc injectable suspension is produced by mixing insulin zinc injectable suspension (crystalline) and insulin zinc injectable suspension (amorphous) in a ratio of 7 to 3.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals with a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm; a considerable proportion of the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay.

For preparations made from a single species of insulin (bovine, porcine or human), the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution. For preparations made from a mixture of bovine and porcine insulin, the positions of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

Insulin not extractable with buffered acetone solution

63 per cent to 77 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant liquid. Suspend the residue in 1.65 ml of *water R*, add 3.3 ml of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant liquid and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 ml. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

Total zinc

0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854).*

Zinc in solution

20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854).*

Ph Eur

Inulin Injection

General Notices

Action and use

Diagnostic agent used in the determination of renal function (glomerular filtration rate).

DEFINITION

Inulin Injection is a sterile solution containing 10% w/v of Inulin and 0.8% w/v of Sodium Chloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of inulin

9.5 to 10.5% w/v.

Content of sodium chloride, NaCl

0.75 to 0.85% w/v.

Before carrying out the following tests dissolve any solid matter by heating in a water bath.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a suspension of *silica gel G* in a 0.3% w/v solution of *sodium acetate* to coat the plate, but spreading a layer 0.5 mm thick. Use a mixture of 10 volumes of *water*, 60 volumes of *chloroform* and 70 volumes of *glacial acetic acid* as the mobile phase. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) mix 1 volume of the injection with 3 volumes of *water*. For solution (2) mix 1 volume of the injection with 3 volumes of a 12.5% w/v solution of *oxalic acid*, boil the mixture for 10 minutes and cool before application. Solution (3) contains 2.5% w/v of D-*fructose* and 0.1% w/v of D-*glucose monohydrate* in *water*. Develop the chromatograms in a continuous elution tank for about 4 hours. After removal of the plate, evaporate the solvent in a current of warm air and spray with a solution in *acetone* containing 1% v/v of *aniline*, 1% v/v of *diphenylamine* and 1% v/v of *orthophosphoric acid* and heat for 10 minutes at 130°. The two principal spots in the chromatogram obtained with solution (2) correspond to those in the chromatogram obtained with solution (3). The spot in the chromatogram obtained with solution (1) remains on the line of application.

B. Dilute 1 ml to 20 ml with *water*. To 2 ml of the diluted solution add 3 ml of a 0.15% w/v solution of *resorcinol* in *ethanol (96%)* followed by 3 ml of *hydrochloric acid*, mix and heat at 80°. A red colour is produced.

C. Yields the *reactions* characteristic of *sodium salts* and reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 5.0 to 7.0, Appendix V L.

Reducing sugars

Heat 5.0 ml of *cupri-tartaric solution R1* and titrate with the injection adding a few ml at a time and boiling for 10 to 15 seconds between each addition. When the solution becomes greenish-yellow, add 0.25 ml of a 1% w/v solution of *methylene blue* and continue the titration until the solution becomes orange. Repeat the operation using a 0.50% w/v solution of D-*fructose* in place of the injection. The volume of the fructose solution used is not greater than that of the injection.

Pyrogens

Complies with the *test for pyrogens*, Appendix XIV D. Use 10 ml per kg of the rabbit's weight.

ASSAY

For inulin

Dilute 50 ml with sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and measure the *optical rotation* using a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 1.299 represents the weight in g of inulin in the volume of the injection taken for assay.

For NaCl

Titrate 10 ml with 0.1M *silver nitrate VS* using *potassium chromate solution* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 5.845 mg of NaCl.

STORAGE

Inulin Injection deposits solid matter on storage. Before use, solid matter should be completely redissolved by heating for not more than 15 minutes; the solution should be cooled to a suitable temperature before administration and should not be reheated.

Iodised Oil Fluid Injection

General Notices

Action and use

Radio-opaque injection.

DEFINITION

Iodised Oil Fluid Injection is a sterile iodine addition product of the ethyl esters of the fatty acids obtained from poppy-seed oil.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of combined iodine

37.0 to 39.0% w/w.

CHARACTERISTICS

A straw-coloured or yellow, oily liquid.

Practically insoluble in *water*; soluble in *chloroform*, in *ether* and in *petroleum spirit (boiling range, 40° to 60°)*.

IDENTIFICATION

Boil 0.05 ml with 2 ml of *glacial acetic acid* and 0.1 g of *zinc powder* for 2 minutes, add 5 ml of *water*, shake, decant from any undissolved zinc and add 1 ml of *hydrogen peroxide solution (20 vol)*. Iodine vapour is evolved.

TESTS

Acidity

To 5 ml of *chloroform* add 5 ml of *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* with 0.1M *ethanolic sodium hydroxide VS*, add 5 g of the injection, shake and titrate with 0.1M *ethanolic sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Not more than 1.0 ml is required to change the colour of the solution.

Weight per ml

1.28 to 1.30 g, Appendix V G.

Free iodine

Shake 1 g with 1 ml of *starch mucilage* and 1 ml of *cadmium iodide solution*. Any blue colour disappears on the addition of 0.4 ml of 0.01M *sodium thiosulphate*.

ASSAY

Boil 1 g with 10 ml of *glacial acetic acid* and 1 g of *zinc powder* under a reflux condenser for 1 hour. Add through the condenser 30 ml of hot *water*, filter through absorbent cotton, wash the flask with two 20 ml quantities of hot *water* and pass the washings through the filter. Cool the filtrate, add 25 ml of *hydrochloric acid* and 8 ml of *potassium cyanide solution* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes light brown; add 5 ml of *starch mucilage* and continue the titration until the blue colour disappears. Each ml of 0.05M *potassium iodate VS* is equivalent to 12.69 mg of combined iodine.

STORAGE

Iodised Oil Fluid Injection should be kept in an atmosphere of carbon dioxide or nitrogen and protected from light.

Iofendylate Injection

General Notices

Action and use

Iodinated contrast medium.

DEFINITION

Iofendylate Injection is a sterile mixture of stereoisomers of ethyl 10-(4-iodophenyl) undecanoate ($C_{19}H_{29}IO_2$).
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iofendylate, $C_{19}H_{29}IO_2$

98.0 to 101.0% w/w.

CHARACTERISTICS

Almost colourless to pale yellow, viscous liquid.

Very slightly soluble in *water*; freely soluble in *ethanol (96%)*; miscible with *chloroform* and with *ether*.

IDENTIFICATION

A. When heated with *sulphuric acid*, violet vapours of iodine are evolved.

B. To 1 ml add 15 ml of *water* and 7 g of *potassium dichromate*, cool and carefully add 10 ml of *sulphuric acid*. Allow to stand until the reaction ceases, heat under a reflux condenser for 2 hours, cool, pour into 25 ml of *water* and filter. Wash the residue with a little *water*, recrystallise from 10 ml of aqueous ethanol and sublime the crystals. The *melting point* of the sublimate is about 270°, Appendix V A.

TESTS

Acid value

Not more than 1.5, Appendix X B.

Refractive index

1.525 to 1.527, Appendix V E.

Saponification value

132 to 142, Appendix X G. Use 1 g.

Weight per ml

1.245 to 1.260 g, Appendix V G.

Aliphatic iodine

Mix 0.5 g with 10 ml of 1M *ethanolic potassium hydroxide* and boil vigorously under a reflux condenser in a water bath for 1 hour. Add 40 ml of *water* and 15 ml of *hydrochloric acid*, cool, filter and wash the residue with 10 ml of *water*. To the combined filtrate and washings add 10 ml of *potassium cyanide solution*, 5 ml of *starch mucilage* and 0.2 ml of 0.05M *potassium iodate*. A blue colour is not produced.

Free iodine

Absorbance of a 4-cm layer at 485 nm, not more than 0.20, Appendix II B.

ASSAY

Carry out the method for *oxygen-flask combustion for iodine*, Appendix VIII C, using 20 mg absorbed on filter paper surrounded by greaseproof paper. Each ml of 0.02M *sodium thiosulphate VS* is equivalent to 1.388 mg of $C_{19}H_{29}IO_2$.

STORAGE

Iophendylate Injection should be protected from light.

Action and use

Radio-opaque injection.

Iopanoic Acid Tablets

General Notices

Action and use

Iodinated contrast medium.

DEFINITION

Iopanoic Acid Tablets contain Iopanoic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of iopanoic acid, $C_{11}H_{12}I_3NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 30 mg of Iopanoic Acid with 10 ml of *ethanol (96%)*, filter, evaporate the filtrate to dryness and dry the residue at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of iopanoic acid *(RS 192)*.

B. Spray the chromatograms obtained in the test for Related substances with a 0.1% w/v solution of *dimethylamino-cinnamaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *ethanol (96%)*. The principal spot in the chromatogram obtained with solution (2) is similar in position, colour and size to that in the chromatogram obtained with solution (4).

TESTS

Halide

To a quantity of the powdered tablets containing 0.8 g of Iopanoic Acid add just sufficient 0.2M *sodium hydroxide* to dissolve the iopanoic acid, dilute to 10 ml with *water*, add sufficient 2M *nitric acid* dropwise to ensure complete precipitation of the iodinated acid and add 3 ml in excess. Filter (Whatman GF/C filter paper is suitable), wash the precipitate with 5 ml of *water* and combine the solutions. 15 ml of the resulting solution complies with the *limit test for chlorides*, Appendix VII (180 ppm, calculated as chloride).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of 13.5M *ammonia*, 20 volumes of *methanol*, 20 volumes of *toluene* and 50 volumes of *1,4-dioxan* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 1.0 g of Iopanoic Acid with five 10 ml quantities of *ethanol (96%)*, filter, evaporate the combined filtrates to dryness using a rotary evaporator and dissolve the residue in 10 ml of a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. For solution (2) dilute 1 volume of solution (1) to 10 volumes with a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. For solution (3) dilute 1 volume of solution (1) to 500 volumes with a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. Solution (4) contains 1.0% w/v of *iopanoic acid EPCRS* in a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense that the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

Weigh and powder 20 tablets. Triturate a quantity of the powder containing 0.4 g of Iopanoic Acid with five 10-ml quantities of *ethanol (96%)*, decanting and filtering each extract through the same filter. Evaporate the combined filtrates almost to dryness on a water bath, cool, add 20 ml of *water*, 12 ml of 5M *sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through absorbent cotton and wash the flask and filter with two 20 ml quantities of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with 0.05M *potassium iodate VS* until the dark brown solution becomes light brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless. Each ml of 0.05M *potassium iodate VS* is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.

STORAGE

Iopanoic Acid Tablets should be protected from light.

Ipratropium Nebuliser Solution

General Notices

DEFINITION

Ipratropium Nebuliser Solution is a solution of Ipratropium Bromide in Water for Injections and may contain sodium chloride.

The nebuliser solution complies with the requirements stated under Preparations for Inhalation and with the following requirements.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Evaporate a volume of the nebuliser solution containing 1.5 mg of Ipratropium Bromide to dryness on a water bath. Shake the residue with 5 ml of methanol and filter (Whatman GF/C is suitable). Evaporate the filtrate to dryness on a water bath and dry the residue at room temperature at a pressure of 1 kPa for 15 minutes. The infrared absorption spectrum of the dried residue, Appendix II A, is concordant with a spectrum prepared from a mixture of 5 mg of ipratropium bromide BPCRS and 45 mg of sodium chloride dissolved in the minimum quantity of water, evaporated to dryness on a water bath and treated in a similar manner to the substance being examined beginning at the words "Shake the residue with 5 ml of methanol,……".

B. To a quantity of the nebuliser solution containing 0.5 mg of Ipratropium Bromide add 75 mg of lead dioxide and 0.25 ml of acetic acid, shake gently and allow to stand for 5 minutes. Add one drop to a strip of filter paper previously impregnated with decolorised fuchsin solution, a characteristic violet colour develops.

TESTS

Acidity

pH, 3.0 to 4.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nebuliser solution, if necessary, with sufficient 0.001M *hydrochloric acid* to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) Dilute 1 volume of solution (1) to 200 volumes with 0.001M *hydrochloric acid*.

(3) 0.005% w/v of *8*s*-isopropyl-3*b*-hydroxytropanium bromide BPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm)(Columbus C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.5 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 20 µl for each solution.

For solution (1) allow the chromatography to proceed for 6 times the retention time of ipratropium (retention time of ipratropium, about 11 minutes).

MOBILE PHASE

A mixture of 4 volumes of freshly distilled *triethylamine,* 50 volumes of *propan-2-ol R1,* 100 volumes of *acetonitrile R1* and 850 volumes of a 0.1% w/v solution of *sodium methanesulphonate* previously adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Osmolality

The osmolality of the solution is 245 mosmol/kg to 299 mosmol/kg, Appendix V N.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nebuliser solution, if necessary, with sufficient 0.001M *hydrochloric acid* to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) 0.02% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

(3) 0.005% w/v of *8*s*-isopropyl-3*b*-hydroxytropanium bromide BPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution*

factor between the two principal peaks is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{30}NO_3Br,H_2O$ in the solution using the declared content of $C_{20}H_{30}NO_3Br,H_2O$ in *ipratropium bromide BPCRS.*

STORAGE

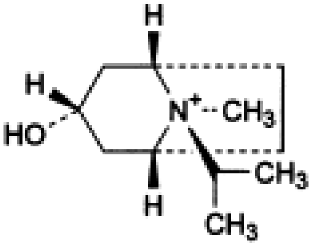
Ipratropium Nebuliser Solution should be stored protected from light in a sealed container.

LABELLING

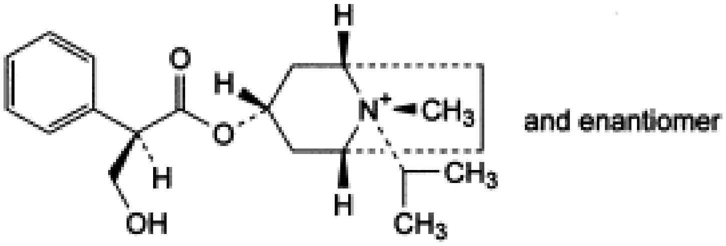
The label states the quantity of Ipratropium Bromide.

IMPURITIES

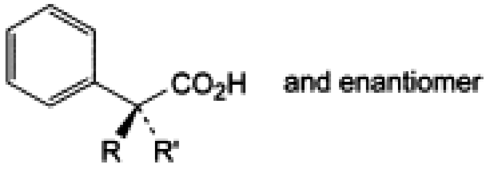
The impurities limited by the requirements of this monograph include.



A. (1*R*,3*r*,5*S*,8*r*)-3-hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo [3.2.1]octane,



B. (1*R*,3*r*,5*S*,8*s*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,



C. R = CH_2-OH, R′ = H: (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

D. R + R′ = CH_2: 2-phenylpropenoic acid (atropic acid).

Ipratropium Powder for Inhalation

General Notices

DEFINITION

Ipratropium Powder for Inhalation consists of hard gelatin capsules containing Ipratropium Bromide admixed with Glucose. The contents of the capsules are in powder of a suitable fineness.

The powder for inhalation complies with the requirements stated under Preparations for Inhalation and the contents of the capsules comply with the following requirements.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Vigorously shake for 2 minutes a quantity of the contents of the capsules containing 0.1 g of Ipratropium Bromide with 1 ml of *methanol*, centrifuge and use the supernatant.

(2) 0.1% w/v of *ipratropium bromide BPCRS* in a saturated solution of *glucose*.

(3) 0.0005% w/v of *tropic acid* in a saturated solution of *glucose*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254} (Merck HPTLC plates are suitable).

(b) The mobile phase is a mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

(c) Develop to 5 cm.

(d) Application volume of 10 µl for each solution.

(e) Remove the plate, dry for 15 minutes at 60^{c}, spray with *potassium iodobismuthate solution,* dry briefly in a current of air and spray with a 5% w/v solution of *sodium nitrite*.

VALIDITY

The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and intensity to that in the chromatogram obtained with solution (2).

B. Disperse a quantity of the contents of the capsules containing the equivalent of 0.3 mg of bromide ion in 0.5 ml of *water* add 75 mg of *lead dioxide* and 0.25 ml of *acetic acid*, shake gently and allow to stand for 5 minutes. Add one drop to a strip of filter paper previously impregnated with *decolorised fuchsin solution*, a characteristic violet colour develops.

C. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Vigorously shake for 2 minutes a quantity of the contents of the capsules containing 0.1 g of Ipratropium Bromide with 1 ml of *methanol*, centrifuge and use the supernatant.

(2) Dilute 1 volume of solution (1) to 200 volumes with a saturated solution of *glucose*.

(3) 0.0005% w/v of *tropic acid* in a saturated solution of *glucose*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* GF_{254} (Merck HPTLC plates are suitable).

(b) The mobile phase is a mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

(c) Develop to 5 cm.

(d) Application volume of 10 µl for each solution.

(e) Remove the plate, dry for 15 minutes at 60°, spray with *potassium iodobismuthate solution,* dry briefly in a current of air and spray with a 5% w/v solution of *sodium nitrite*.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to tropic acid is not more intense than the spot in the chromatogram obtained with solution (2)(0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2)(0.5%).

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules solution with sufficient mobile phase to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) Dilute 1 volume of solution (1) to 200 volumes with mobile phase.

(3) 0.005% w/v of *8*s*-isopropyl-3*b*-hydroxytropanium bromide BPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm), (Lichrospher 60 RP-select B is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 3 volumes of *acetonitrile for chromatography and* 25 volumes of a 0.1% w/v solution of *sodium methanesulphonate* in 0.05M *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules with sufficient 0.01M *hydrochloric acid* to produce a solution containing 0.0040% w/v of Ipratropium Bromide, filter and use the filtrate.

(2) 0.004% w/v of *ipratropium bromide BPCRS* in 0.01M *hydrochloric acid*.

(3) 0.005% w/v of *8s-isopropyl-3b-hydroxytropanium bromide BPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm), (Lichrospher 60 RP-select B is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Detection wavelength of 210 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 27 volumes of *acetonitrile for chromatography* and 100 volumes of a 0.25% w/v solution of *sodium heptanesulphonate monohydrate* in *water* adjusted to pH 3.2 with 0.05M *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{30}NO_3Br,H_2O$ in the powder for inhalation using the declared content of $C_{20}H_{30}BrNO_3,H_2O$ in *ipratropium bromide BPCRS.*

LABELLING

The label states the quantity of Ipratropium Bromide contained in each capsule.

IMPURITIES

The impurities limited by the requirements of this monograph include.

Ipratropium Pressurised Inhalation

General Notices

Action and use

Anticholinergic (antimuscarinic) bronchodilator.

DEFINITION

Ipratropium Pressurised Inhalation is a solution or suspension of Ipratropium Bromide in a suitable liquid in a suitable pressurised container.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalations and with the following requirements.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$

85.0 to 115.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (6).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to ipratropium bromide in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a high performance silica gel precoated plate (Merck silica gel 60 HPTLC plates are suitable) and a mixture of 5 volumes of *water*, 8 volumes of *anhydrous formic acid*, 28 volumes of *methanol* and 70 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 6 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) punch a small hole in the ferrule of each of three cooled containers, allow the propellant to evaporate for about 1 minute and transfer the contents of the containers, through the punched holes, to a beaker. Stir, using a magnetic stirrer, for about 10 minutes, add 3.5 ml of 0.01M *hydrochloric acid* and continue stirring for about 1 hour, until the propellant has completely evaporated, filter, add 10 ml of *chloroform* to the filtrate and shake vigorously for 1 minute. Allow the phases to separate and use the upper layer. For solution (2) dilute 1 volume of solution (1) to 50 volumes with 0.01M *hydrochloric acid*. For solution (3) dilute 1 volume of solution (2) to 4 volumes with 0.01M *hydrochloric acid*. For solution (4) dilute 2 volumes of solution (3) to 5 volumes with 0.01M *hydrochloric acid*. Solution (5) contains 0.008% w/v of *8*s*-isopropyl-3*β*-hydroxytropanium bromide BPCRS* in 0.01M *hydrochloric acid*. Solution (6) contains 0.008% w/v of *ipratropium bromide BPCRS* in 0.01M *hydrochloric acid*. After removal of the plate, dry it in a current of warm air for about 30 minutes. Spray the plate with a mixture of 1 volume of *potassium iodobismuthate solution*, 2 volumes of *glacial acetic acid* and 10 volumes of *water*, allow to dry briefly, spray with a 5% w/v solution of *sodium nitrite* and immediately examine the plate. In the chromatogram obtained with solution (1) any spot corresponding to 8*s*-isopropyl-3β-hydroxytropanium bromide is not more intense than the spot in the chromatogram obtained with solution (2) (2%), any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

Deposition of the emitted dose

Carry out the test for *aerodynamic assessment of fine particles*, Appendix XII C7, but determining the content of active ingredient as described below. Use Apparatus A with 7 ml of 0.001M *hydrochloric acid* in the upper impingement chamber and 40 ml of a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol* in the lower impingement chamber. Use the same solvent mixture to wash the coupling tube, E, and transfer the combined solution and washings in the lower impingement chamber to a 100 ml graduated flask, rinsing the chamber with the solvent mixture and dilute the combined solution to 100 ml with the solvent mixture.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.00007% w/v of *ipratropium bromide BPCRS* in a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol*. For solution (2) use the diluted solution from the lower impingement chamber.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (Lichrospher RP8 select B is suitable), (b) a mixture of 345 volumes of *acetonitrile* and 750 volumes of 0.012M *sodium heptanesulphonate* previously adjusted to pH 3.2 with 0.05M *orthophosphoric acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 210 nm.

The test is not valid unless in the chromatogram obtained with solution (1) the *symmetry factor* of the peak due to ipratropium bromide is less than 3.0 and unless the *signal-to-noise ratio* of the peak is at least 3.0.

Calculate the amount of ipratropium bromide, $C_{20}H_{30}BrNO_3,H_2O$, delivered to the lower impingement chamber per actuation of the valve using the declared content of $C_{20}H_{30}BrNO_3$, H_2O in *ipratropium bromide BPCRS*. Not less than 25% of the average amount of ipratropium bromide delivered per actuation of the valve, calculated as the average of the three results determined in the Assay, is deposited in the lower impingement chamber.

ASSAY

Determine the content of active ingredient delivered by the first 10 successive combined actuations of the valve after priming. Carry out the procedure for content of active ingredient delivered by actuation of the valve described under Pressurised Inhalations, Preparations for Inhalation, beginning at the words 'Remove the pressurised container from the actuator…' and ending at the words '… to the volume specified in the monograph' using 20 ml of a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol* in the vessel. Use the same solvent mixture to wash the pressurised container and to dilute the combined solution and washings obtained from the set of 10 combined actuations to 50 ml (solution A). Determine the amount of active ingredient in the 10 combined actuations using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.00040% w/v of *ipratropium bromide BPCRS* in a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol*. For solution (2) use solution A.

The chromatographic conditions described under Deposition of the emitted dose may be used. In the chromatogram obtained with solution (1) long-running peaks due to excipients may appear.

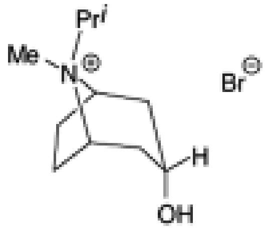
The test is not valid unless in the chromatogram obtained with solution (1) the *symmetry factor* for the peak due to ipratropium bromide is less than 3.0.

Calculate the average content of $C_{20}H_{30}BrNO_3,H_2O$ delivered by a single actuation of the valve using the declared content of $C_{20}H_{30}BrNO_3,H_2O$ in *ipratropium bromide BPCRS*.

Determine the content of active ingredient a second and a third time by repeating the procedure on the middle 10 and the last 10 successive combined actuations of the valve, as estimated from the number of deliveries available from the container as stated on the label. For each of the three determinations the average content of $C_{20}H_{30}BrNO_3,H_2O$ delivered by a single actuation of the valve is within the limits stated under Content of ipratropium bromide.

IMPURITIES

In addition to the impurities shown in the monograph for Ipratropium Bromide the degradation impurities limited by the requirements of this monograph include:



A. 8*s*-isopropyl-3β-hydroxytropanium bromide.

Iron Dextran Injection

General Notices

Action and use

Used in prevention and treatment of anaemia.

DEFINITION

Iron Dextran Injection is a sterile colloidal solution containing a complex of iron(III) hydroxide with dextrans of weight average molecular weight between 5000 and 7500.

PRODUCTION

Iron Dextran Injection is produced by a method of manufacture designed to provide an iron-dextran complex with appropriate iron absorption characteristics. This may be confirmed for routine control purposes by the use of an appropriate combination of physico-chemical tests, subject to the agreement of the competent authority.

The method of manufacture is validated to demonstrate that, if tested, the injection would comply with the following test.

Undue toxicity

Inject 0.10 ml into a tail vein of each of 10 mice; not more than three mice die within 5 days of injection. If more than three mice die within 5 days, repeat the test on another group of 20 mice. Not more than 10 of the 30 mice used in the combined tests die within 5 days of injection.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iron, Fe

4.75 to 5.25% w/v.

Content of dextrans

17.0 to 23.0% w/v.

CHARACTERISTICS

A dark brown solution.

IDENTIFICATION

A. Add 5M *ammonia* to 0.2 ml of the injection previously diluted to 5 ml with *water*. No precipitate is produced.

B. Mix 1 ml with 100 ml of *water*. To 10 ml of this solution add 0.2 ml of *hydrochloric acid*, boil for 30 seconds, cool rapidly, add 4 ml of 13.5M *ammonia* and 10 ml of *hydrogen sulphide solution*, boil for at least 4 minutes to remove hydrogen sulphide, cool and filter.

Boil 5 ml of the filtrate with 5 ml of *cupri-tartaric solution R1*; the solution remains greenish in colour and no precipitate is produced. Boil a further 5 ml of the filtrate with 0.5 ml of *hydrochloric acid* for 5 minutes, cool, add 2.5 ml of 5M *sodium hydroxide* and 5 ml of *cupri-tartaric solution R1* and boil again; a reddish precipitate is produced.

C. To 1 ml add 20 ml of *water* and 5 ml of *hydrochloric acid* and boil for 5 minutes. Cool, add an excess of 13.5M *ammonia* and filter. Wash the precipitate with *water*, dissolve in the minimum volume of 2M *hydrochloric acid* and add sufficient *water* to produce 20 ml. The resulting solution yields reaction B characteristic of *iron salts*, Appendix VI.

TESTS

Acidity

pH, 5.2 to 6.5, Appendix V L.

Arsenic

To 5.0 ml in a Kjeldahl flask add 10 ml of *water* and 10 ml of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 10 ml of *sulphuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise at intervals until oxidation is complete. Cool, add 30 ml of *water*, bring to the boil and continue boiling until the volume of liquid is reduced to about 20 ml. Cool and dilute to 50 ml with *water*. Reserve a portion of the solution for the test for Lead. To 5 ml of the solution add 10 ml of *water*, 15 ml of *stannated hydrochloric acid* and 3 ml of *tin*(II) *chloride solution AsT*. Connect to a condenser and distil 15 ml into 10 ml of *water*. To the distillate add 0.2 ml of *bromine water* and remove the excess of bromine with *tin*(II) *chloride solution AsT*. The solution complies with the *limit test for arsenic*, Appendix VII (2 µg per ml).

Copper

To 5.0 ml add 5 ml of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 2 ml of *sulphuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise at intervals until oxidation is complete. Cool, add 25 ml of *hydrochloric acid*, warm to dissolve, cool and extract with four 25 ml quantities of *isobutyl acetate*, discarding the extracts. Evaporate the acid solution to dryness, adding *nitric acid* dropwise if charring occurs. Dissolve the residue in 10 ml of 1M *hydrochloric acid*, reserving a portion of the solution for the test for Zinc. To 1 ml add 25 ml of *water* and 1 g of *citric acid*, make alkaline to *litmus paper* with 5M *ammonia*, dilute to 50 ml with *water*, add 1 ml of *sodium diethyldithiocarbamate solution* and allow to stand for 5 minutes. Any colour produced is not more intense than that produced by treating in the same manner a mixture of 3 ml of *copper standard solution (10 ppm Cu)* and 1 ml of 1M *hydrochloric acid* beginning at the words 'add 25 ml of *water*…' (60 µg per ml).

Lead

To 16.0 ml of the solution reserved in the test for Arsenic add 50 ml of *hydrochloric acid* and extract with four 20 ml quantities of *isobutyl acetate*, discarding the extracts. Evaporate the acid solution to dryness and dissolve the residue in 20 ml of *water*. 12 ml of the solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (2 ppm Pb)* to prepare the standard (25 µg per ml).

Zinc

To 5.0 ml of the solution reserved in the test for Copper add 15 ml of 1M *sodium hydroxide*, boil, filter, wash the residue with *water* and dilute the combined filtrate and washings to 25 ml with *water*. To 5 ml add 5 ml of 1M *hydrochloric acid* and 2 g of *ammonium chloride*, dilute to 50 ml with *water*, add 1 ml of freshly prepared *dilute potassium hexacyanoferrate*(II) *solution* and allow to stand for 20 minutes. Any opalescence produced is not more than that produced when 1 ml of freshly prepared *dilute potassium hexacyanoferrate*(II) *solution* is added to a solution prepared from 3 ml of *zinc standard solution (25 ppm Zn)*, 3 ml of 1M *sodium hydroxide*, 6 ml of 1M *hydrochloric acid* and 2 g of *ammonium chloride* diluted to 50 ml with *water* and allowed to stand for 20 minutes (150 µg per ml).

Chloride

To 5 ml add 75 ml of *water* and 0.05 ml of *nitric acid* and titrate immediately with 0.1M *silver nitrate VS* determining the end point potentiometrically. 6.8 to 9.6 ml of 0.1M *silver nitrate VS* is required.

Iron absorption

Using at least two rabbits, each weighing between 1.5 and 2.5 kg, clip the right hind leg free from hair over the injection site and swab the area with a bactericidal solution. Inject into each rabbit 0.4 ml of the injection per kg of the rabbit's weight using a 2 ml syringe fitted with a No. 12 hypodermic needle [22 gauge × 1.25 inch (0.7 × 32 mm approx.)]. Insert the needle at the distal end of the semitendinosus muscle, passing through the sartorius and entering the vastus medialis; the angle of the needle must be such that the full length is used. After 7 days, kill the rabbits and remove the legs into which the injections were made. Carefully cut open the muscles and examine the site of injection; it should be only very lightly stained and should show no dark brown deposits and no evidence of leakage along fascial planes. Skin the leg, dissect the flesh from the bone and cut into small pieces. Transfer the pieces to a 1000 ml beaker, add 75 ml of 2M *sodium hydroxide* and sufficient *water* to cover the flesh, cover the beaker with a watch glass and boil until most of the solid matter has disintegrated. Cool, cautiously add 50 ml of *sulphuric acid*, heat the mixture almost to boiling and add carefully ten 1 ml quantities of *fuming nitric acid* until no charring occurs when the excess of nitric acid has been boiled off. Cool, add 170 ml of *water,* boil until solution is complete, cool and dilute to 250 ml with *water.* To 5 ml of this solution add 3 ml of *sulphuric acid*, heat to fuming and complete the oxidation by the addition of small quantities of *nitric acid* until the solution is colourless. Cool, add 20 ml of *water,* boil for 3 minutes and add 10 ml of *ammonium citrate solution,* 10 ml of *ammonium mercaptoacetate solution,* 5M *ammonia* dropwise until the iron colour is fully developed, 1 ml of 5M *ammonia* in excess and sufficient *water* to produce 100 ml. Measure the *absorbance* of the resulting solution at 530 nm, Appendix II B.

Prepare a reference solution by adding 20 ml of *water* the same quantities of *ammonium citrate solution, ammonium mercaptoacetate solution* and 5M *ammonia* as used above, dilute to 100 ml with *water* and measure the *absorbance* at 530 nm. From the difference between the absorbances, calculate the amount of Fe present in the legs from a reference curve prepared by treating suitable aliquots of a solution of *ammonium iron*(III) *sulphate* containing 0.01% w/v of Fe by the procedure described above beginning at the words 'add 10 ml of *ammonium citrate solution*…'. Repeat the determination of Fe on the corresponding legs into which no injection was made, beginning at the words 'Carefully cut open the muscles…'. From the difference between the two amounts of iron, calculate the proportion of injected iron, as Fe, remaining in the leg tissues. Not more than 20% of the injected iron remains.

Bacterial endotoxins

The endotoxin limit concentration is 0.50 IU per mg of iron, Appendix XIV C.

ASSAY

For iron

To 2 g add 10 ml of *water* and 5 ml of *sulphuric acid* and stir for several minutes. Allow to stand for 5 minutes, cool and dilute to 50 ml with *water*. Prepare a suitable zinc amalgam by covering 300 g of *zinc shot* with a 2% w/v solution of *mercury*(II) *chloride* and stir for 10 minutes. Decant the solution, wash the residue three times with *water* and transfer it to a column (30 cm × 18 mm) fitted with a sintered-glass disc (ISO 4793, porosity grade 0, is suitable). Activate the zinc amalgam by passing through the column 200 ml of *sulphuric acid (5%)*. Pass the prepared solution slowly through the column and wash successively with 50 ml of *water*, four 25 ml quantities of *sulphuric acid (5%)* and 50 ml of *water*. Titrate the combined eluates with 0.1M *ammonium cerium*(IV) *sulphate VS* using *ferroin solution* as indicator. Each ml of 0.1M *ammonium cerium*(IV) *sulphate VS* is equivalent to 5.585 mg of Fe. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of Fe.

For dextrans

Dilute 1 g to 500 ml with *water*, dilute 10 ml of the solution to 100 ml with *water*, transfer 3 ml of the resulting solution to a test tube and cool to 0°. Add, to form a lower layer, 6 ml of a solution prepared and maintained at 0° containing 0.2% w/v of *anthrone* in a mixture of 19 volumes of *sulphuric acid* and 1 volume of *water,* mix and immediately heat on a water bath for 5 minutes. Cool and measure the *absorbance* of the resulting solution at the maximum at 625 nm, Appendix II B. Repeat the operation using 3 ml of *water* in place of the dilution of the injection. From the difference between the absorbances calculate the content of glucose present using a calibration curve prepared by treating suitable amounts of D-*glucose* in the same manner. Each g of D-*glucose* is equivalent to 0.94 g of dextrans. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of dextrans.

LABELLING

The strength is stated as the equivalent amount of iron, Fe, in a suitable dose-volume.

Iron Sucrose Injection

General Notices

Action and use

Used in prevention and treatment of anaemia.

DEFINITION

Iron Sucrose Injection is a sterile colloidal solution containing a complex of iron(III) hydroxide with sucrose of average molecular weight between 34000 and 60000.

PRODUCTION

Iron Sucrose Injection is produced by a method of manufacture designed to provide an iron-sucrose complex with appropriate iron absorption characteristics. This may be confirmed for routine control purposes by the use of an appropriate combination of physico-chemical tests, subject to the agreement of the competent authority.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iron, Fe

1.90 to 2.10% w/v.

Content of sucrose

27.0 to 33.0% w/v.

IDENTIFICATION

A. To 1 ml of the injection add 20 ml of *water* and 5 ml of *hydrochloric acid* and boil for 5 minutes. Cool, add an excess of 13.5M *ammonia* and filter. Wash the precipitate with *water*, dissolve in the minimum volume of 2M *hydrochloric acid* and add sufficient *water* to produce 20 ml. The resulting solution yields reaction B characteristic of *iron salts*, Appendix VI.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH, 10.5 to 11.0, Appendix V L.

Osmolality

The osmolality, Appendix V N, of the injection is 1150 mosmol/l to 1350 mosmol/l.

Arsenic

To 10.0 ml of injection in a long-necked combustion flask add 20 ml of *water* and 20 ml of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 20 ml of *sulphuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise until oxidation is complete. Cool, add 60 ml of *water,* bring to the boil and continue boiling until the volume of liquid is reduced to about 40 ml. Cool and dilute to 100 ml with *water*. Reserve a portion of the solution for the test for Lead. To 12.5 ml of the solution add 10 ml of *water*, 15 ml of *stannated hydrochloric acid* and 3 ml of *tin(II) chloride solution AsT*. Connect to a condenser and distil 15 ml into 10 ml of *water*. To the distillate add 0.2 ml of *bromine water* and remove the excess of bromine with *tin(II) chloride solution AsT*. The solution complies with the *limit test for arsenic*, Appendix VII (1 µg per ml).

Copper

To 5.0 ml of the injection add 5 ml of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 2 ml of *sulphuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise until oxidation is complete. Cool, add 25 ml of *hydrochloric acid*, warm to dissolve, cool and wash with four 25-ml quantities of *isobutyl acetate*, discarding the washings. Evaporate the acid solution to dryness, adding *nitric acid* dropwise if charring occurs. Dissolve the residue in 10 ml of 1M *hydrochloric acid*, reserving a portion of the solution for the test for Zinc. To 1 ml add 25 ml of *water* and 1 g of *citric acid*, make alkaline to *litmus paper* with 5M *ammonia*, dilute to 300 ml with *water*, to 50 ml add 1 ml of *sodium diethyldithiocarbamate solution* and allow to stand for 5 minutes. Any colour produced is not more intense than that produced by treating in the same manner a mixture of 0.5 ml of *copper standard solution (10 ppm Cu)* and 1 ml of 1M *hydrochloric acid* beginning at the words 'add 25 ml of *water*…' (10 µg per ml).

Lead

To 40.0 ml of the solution reserved in the test for Arsenic add 50 ml of *hydrochloric acid* and wash with four 20-ml quantities of *isobutyl acetate*, discarding the washings. Evaporate the acid solution to dryness and dissolve the residue in 20 ml of *water*. 12 ml of the solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (2 ppm Pb)* to prepare the standard (10 µg per ml).

Chloride

To 10 ml of the injection add 75 ml of *water* and 0.05 ml of *nitric acid* and titrate immediately with 0.01M *silver nitrate VS* determining the end point potentiometrically. 4.0 to 8.0 ml of 0.01M *silver nitrate VS* is required.

Bacterial endotoxins

The endotoxin limit concentration is 0.50 IU per mg of iron, Appendix XIV C.

ASSAY

For iron

To 2 g add 10 ml of *water* and 5 ml of *sulphuric acid* and stir for several minutes. Allow to stand for 5 minutes, cool and dilute to 50 ml with *water*. Prepare a suitable zinc amalgam by covering 300 g of *zinc shot* with a 2% w/v solution of *mercury(II) chloride* and stir for 10 minutes. Decant the solution, wash the residue three times with *water* and transfer it to a column (30 cm × 18 mm) fitted with a sintered-glass disc (ISO 4793, porosity grade 0, is suitable). Activate the zinc amalgam by passing through the column 200 ml of *sulphuric acid*

(5%). Pass the prepared solution slowly through the column and wash successively with 50 ml of *water*, four 25-ml quantities of *sulphuric acid (5%)* and 50 ml of *water*. Titrate the combined eluates with 0.1M *ammonium cerium(IV) sulphate VS* using *ferroin solution* as indicator. Each ml of 0.1M *ammonium cerium(IV) sulphate VS* is equivalent to 5.585 mg of Fe. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of Fe.

For sucrose

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a volume of the injection containing 40mg of Iron Sucrose add 2.5 ml of a 3.0% w/v solution of *sodium dihydrogen orthophosphate monohydrate*, mix and allow to stand for 10 minutes, add sufficient *water* to produce 25 ml, centrifuge and filter discarding the first 2ml of filtrate.

(2) 1.30% w/v of *sucrose BPCRS* in mobile phase.

(3) 1.60% w/v of *sucrose BPCRS* in mobile phase.

(4) 1.80% w/v of *sucrose BPCRS* in mobile phase.

(5) 2.10% w/v of *sucrose BPCRS* in mobile phase.

(6) 2.30% w/v of *sucrose BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *aminopropylsilyl silica gel for chromatography* (3-10 µm).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a refractive index detector.

(f) Inject 20 µl of each solution.

MOBILE PHASE

21 volumes of *water* and 79 volumes of *acetonitrile.*

DETERMINATION OF CONTENT

Determine the peak areas of the principal peak in solutions (2), (3), (4), (5) and (6), plot the peak area for each solution as a function of concentration of sucrose and draw a straight line best fitting the five plotted points. From the graph obtained calculate the content of sucrose in the injection using the declared content of sucrose in *sucrose BPCRS*.

LABELLING

The strength is stated as the equivalent amount of iron, Fe, in a suitable dose-volume.

Isoconazole Pessaries

General Notices

Isoconazole Vaginal Tablets

Action and use

Antifungal.

DEFINITION

Isoconazole Pessaries are *vaginal tablets* containing Isoconazole Nitrate in a suitable basis.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of isoconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 10 volumes of *methanol*, 30 volumes of *dichloromethane* and 60 volumes of *hexane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of powdered pessaries containing 10 mg of Isoconazole Nitrate with 10 ml of *dichloromethane* for 5 minutes and filter. Solution (2) contains 0.10% w/v of *isoconazole nitrate BPCRS* in *dichloromethane*. After removal of the plate, allow it to dry in air and spray with *potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to the spot in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of powdered pessaries containing 0.10 g of Isoconazole Nitrate with 10 ml of the mobile phase for 30 minutes and filter. For solution (2) dilute 1 volume of solution (1) to 400 volumes with the mobile phase. Solution (3) contains 0.0025% w/v each of *isoconazole nitrate BPCRS* and of *econazole nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil ODS 3 µm is suitable), (b) a solution of 6.0 g of *ammonium acetate* in a mixture of 300 ml of *acetonitrile*, 320 ml of *methanol* and 380 ml of *water* as the mobile phase at a flow rate of 2 ml per minute and (c) a detection wavelength of 235 nm. Equilibrate the column with the mobile phase at a flow rate of 2 ml per minute for 30 minutes. In the chromatogram obtained with solution (1) allow the chromatography to proceed for 1.5 times the retention time of the principal peak.

In the chromatogram obtained with solution (3) the approximate retention times of econazole and isoconazole are 10 minutes and 14 minutes respectively. The test is not valid unless the *resolution factor* between the peaks due to econazole and isoconazole is at least 5.0. If necessary adjust the composition of the mobile phase.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%) and the sum of the areas of all such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peaks due to the solvent and to nitrate ion and any peak with an area less than 0.4 times that of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered pessaries containing 0.10 g of Isoconazole Nitrate with 100 ml of the mobile phase, mix and filter. Solution (2) contains 0.10% w/v of *isoconazole nitrate BPCRS* in the mobile phase. Solution (3) contains 0.10% w/v each of *isoconazole nitrate BPCRS* and of *econazole nitrate BPCRS* in the mobile phase.

The chromatographic procedure described under Related substances may be used.

In the chromatogram obtained with solution (3) the approximate retention times of econazole and isoconazole are 10 minutes and 14 minutes respectively. The assay is not valid unless the *resolution factor* between the peaks due to econazole and isoconazole is at least 5.0. If necessary adjust the composition of the mobile phase.

Calculate the content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in the pessaries using the declared content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in *isoconazole nitrate BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Isoconazole Nitrate.

Isoniazid Injection

General Notices

Action and use

Antituberculosis drug.

DEFINITION

Isoniazid Injection is a sterile solution of Isoniazid in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of isoniazid, $C_6H_7N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Using a rotary evaporator, evaporate a volume of the injection containing 50 mg of Isoniazid to dryness, extract the residue with two 10 ml quantities of *ethanol (96%)*, filter and evaporate the combined ethanol extracts to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isoniazid *(RS 196)*.

B. To a volume containing 25 mg of Isoniazid add 5 ml of *ethanol (96%)*, 0.1 g of *sodium tetraborate* and 5 ml of a 5.0% w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (96%)*, evaporate to dryness on a water bath, heat for a further 10 minutes and dissolve the residue in 10 ml of *methanol*. A reddish purple colour is produced.

TEST

Acidity

pH, 5.6 to 6.0, Appendix V L.

ASSAY

Dilute a quantity containing 0.4 g of Isoniazid to 250 ml with *water*. To 25 ml of the solution in a glass-stoppered flask add 25 ml of 0.05M *bromine VS* and 5 ml of *hydrochloric acid*, shake for 1 minute, allow to stand for 15 minutes, add 1 g of *potassium iodide* and titrate with 0.1M *sodium thiosulphate VS* using *starch mucilage* as indicator. Repeat the operation without the injection. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 3.429 mg of $C_6H_7N_3O$.

STORAGE

Isoniazid Injection should be protected from light.

Isoniazid Tablets

General Notices

Action and use

Antituberculosis drug.

DEFINITION

Isoniazid Tablets contain Isoniazid.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isoniazid, $C_6H_7N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Isoniazid with 10 ml of *ethanol (96%)* for 15 minutes, centrifuge and decant the supernatant liquid. Extract the residue with two further 10-ml quantities of *ethanol (96%)* and evaporate the combined extracts to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isoniazid *(RS 196)*.

B. Shake a quantity of the powdered tablets containing 1 mg of Isoniazid with 50 ml of *ethanol (96%)* and filter. To 5 ml of the filtrate add 0.1 g of *sodium tetraborate* and 5 ml of a 5% w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (96%)*, evaporate to dryness on a water bath and continue heating for a further 10 minutes. To the residue add 10 ml of *methanol* and mix. A reddish purple colour is produced.

TEST

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of *water* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 263 nm, Appendix II B. Calculate the total content of isoniazid, $C_6H_7N_3O$, in the medium taking 307 as the value of *A* (1%, 1 cm) at the maximum at 263 nm.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.4 g of Isoniazid as completely as possible in *water*, filter and wash the residue with sufficient *water* to produce 250 ml. To 50 ml of the resulting solution add 50 ml of *water*, 20 ml of *hydrochloric acid* and 0.2 g of *potassium bromide* and titrate with 0.0167M *potassium bromate VS* determining the end point electrometrically. Each ml of 0.0167M *potassium bromate VS* is equivalent to 3.429 mg of $C_6H_7N_3O$.

STORAGE

Isoniazid Tablets should be protected from light.

Isophane Insulin Injection

General Notices

Isophane Insulin; Isophane Insulin (NPH)
(Ph Eur monograph 0833)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the modifications prescribed below.

DEFINITION

Isophane insulin injection is a sterile suspension of bovine, porcine or human insulin, complexed with protamine sulphate or another suitable protamine.

PRODUCTION

Isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

The amount of protamine is based on the known isophane ratio and is not less than the equivalent of 0.3 mg and not more than the equivalent of 0.6 mg of protamine sulphate for each 100 IU of insulin in the insulin-protamine complex.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Total zinc

Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854).*

Isoprenaline Injection

General Notices

Action and use

Adrenoceptor agonist.

DEFINITION

Isoprenaline Injection is a sterile solution of Isoprenaline Hydrochloride in Water for Injections. It is supplied either as a ready-to-use solution or prepared immediately before use in accordance with the manufacturer's instructions from Sterile Isoprenaline Concentrate.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

Content of isoprenaline hydrochloride, $C_{11}H_{17}NO_3,HCl$

90.0 to 115.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 250 to 330 nm. For solution (1) dilute the injection, if necessary, with *methanol* to contain 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) is a 0.002% w/v solution of *isoprenaline hydrochloride BPCRS* in *methanol*. The spectrum obtained with solution (1) exhibits a maximum at 294 nm and a trough at 289 nm and is similar to the spectrum obtained with solution (2) in the range 280 to 298 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a reversed-phase high performance plate (Merck HPTLC RP18 F_{254} plates are suitable) and a mixture of 0.1 volume of *glacial acetic acid*, 40 volumes of *water* and 60 volumes of *methanol* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) evaporate a suitable volume of the solution just to dryness and dissolve the residue in sufficient *methanol* to produce a solution containing 0.01% w/v of Isoprenaline Hydrochloride. Solution (2) contains 0.01% w/v of *isoprenaline hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in air, heat at 105° for 15 minutes and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To 2 ml add 0.1 ml of *iron(III) chloride solution R1*. An emerald green colour is produced which, on the gradual addition of *sodium hydrogen carbonate solution*, changes first to blue and then to red.

TEST

Acidity

pH, 2.5 to 3.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the solution diluted, if necessary, with sufficient of a 0.1% w/v solution of *sodium metabisulphite* to produce a solution containing 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) contains 0.002% w/v of *isoprenaline hydrochloride BPCRS* in a 0.1% w/v solution of *sodium metabisulphite*. Solution (3) is a mixture of 1 volume of a 0.02% w/v solution of *adrenaline acid tartrate* in the mobile phase containing 1.0% w/v of *sodium metabisulphite* and 18 volumes of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 to 10 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution prepared by dissolving 1.76 g of *sodium heptanesulphonate* in 800 ml of *water*, adding 200 ml of *methanol* and adjusting the pH to 3.0 with 1M *orthophosphoric acid* and (c) a detection wavelength of 280 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.5.

Calculate the content of $C_{11}H_{17}NO_3$,HCl in the injection using the declared content of $C_{11}H_{17}NO_3$,HCl in *isoprenaline hydrochloride BPCRS*.

STERILE ISOPRENALINE CONCENTRATE

DEFINITION

Sterile Isoprenaline Concentrate is a sterile solution of Isoprenaline Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of isoprenaline hydrochloride, $C_{11}H_{17}NO_3$,HCl

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 250 to 330 nm. For solution (1) dilute the concentrate with *methanol* to contain 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) is a 0.002% w/v solution of *isoprenaline hydrochloride BPCRS* in *methanol*. The spectrum obtained with solution (1) exhibits a maximum at 294 nm and a trough at 289 nm and is similar to the spectrum obtained with solution (2) in the range 280 to 298 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a reversed-phase high performance plate (Merck HPTLC RP18 F_{254} plates are suitable) and a mixture of 0.1 volume of *glacial acetic acid*, 40 volumes of *water* and 60 volumes of *methanol* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) dilute the concentrate with *methanol* to produce a solution containing 0.01% w/v of Isoprenaline Hydrochloride. Solution (2) contains 0.01% w/v of *isoprenaline hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in air, heat at 105° for 15 minutes and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To 2 ml add 0.1 ml of *iron(III) chloride solution R1*. An emerald green colour is produced which, on the gradual addition of *sodium hydrogen carbonate solution*, changes first to blue and then to red.

TEST

Acidity

pH, 2.5 to 3.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the concentrate diluted with sufficient of a 0.1% w/v solution of *sodium metabisulphite* to produce a solution containing 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) contains 0.002% w/v of *isoprenaline hydrochloride BPCRS* in a 0.1% w/v solution of *sodium metabisulphite*. Solution (3) is a mixture of 1 volume of a 0.02% w/v solution of *adrenaline acid tartrate* in the mobile phase containing 1.0% w/v of *sodium metabisulphite* and 18 volumes of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 to 10 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution prepared by dissolving 1.76 g of *sodium heptanesulphonate* in 800 ml of *water*, adding 200 ml of *methanol* and adjusting the pH to 3.0 with 1M *orthophosphoric acid* and (c) a detection wavelength of 280 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.5.

Calculate the content of $C_{11}H_{17}NO_3,HCl$ in the concentrate using the declared content of $C_{11}H_{17}NO_3,HCl$ in *isoprenaline hydrochloride BPCRS*.

STORAGE

Sterile Isoprenaline Concentrate should be protected from light.

Isosorbide Dinitrate Injection

General Notices

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Isosorbide Dinitrate Injection is a sterile solution of isosorbide dinitrate made isotonic with Sodium Chloride in Water for Injections. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Evaporate a suitable volume of the injection under reduced pressure and below 40° to dryness. Shake a quantity of the residue containing 25 mg of isosorbide dinitrate with 10 ml of *dichloromethane* for 5 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isosorbide dinitrate (*RS 412*).

B. Yields the reactions characteristic of *sodium salts* and reaction A characteristic of *chlorides*, Appendix VI.

Acidity or alkalinity

pH, 3.5 to 7.0, Appendix V L.

Nitrite

To 40 ml of the injection add 2 ml of *sulphanilic acid solution*, 2 ml of *aminonaphthalenesulphonic acid solution* and sufficient *water* to produce 50 ml. Allow to stand at room temperature for 1 hour. Measure the *absorbance* of the resulting solution at the maximum at 524 nm, Appendix II B, using in the reference cell a solution prepared by treating 40 ml of *water* in the same manner, beginning at the words "add 2 ml of *sulphanilic acid solution* ...". The *absorbance* is not greater than that obtained by repeating the procedure using 2 ml of *nitrite standard solution (20 ppm)* diluted to 40 ml with *water* and treated at the same time and in the same manner, beginning at the words "add 2 ml of *sulphanilic acid solution* ..." (1 ppm, calculated with reference to the injection).

Isosorbide 5-nitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) evaporate a volume of the injection containing 50 mg of isosorbide dinitrate, under reduced pressure and below 40°, to dryness, triturate the residue with 50 ml of mobile phase*,* shake, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

Solution (2) contains 0.0005% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase. Solution (4) contains 0.005% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 30 volumes of *methanol* and 70 volumes of *water* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

Bacterial endotoxins

The endotoxin limit concentration is 5.0 IU per ml, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection, diluted, if necessary, with sufficient of a mixture of 25 volumes of *methanol* and 75 volumes of *water* to produce a solution containing 0.002% w/v of isosorbide dinitrate. For solution (2) prepare a 0.01% w/v solution of *isosorbide dinitrate BPCRS* in methanol. Filter and dilute 1 volume to 50 volumes with a mixture of 25 volumes of *methanol* and 75 volumes of *water.*

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *trimethylsilyl silica gel for chromatography* (3 µm) (Hypersil SAS is suitable), (b) as the mobile phase with a flow rate of 1.3 ml per minute a mixture containing 0.039% w/v of *ammonium acetate* in 25 volumes of *methanol R2* and 75 volumes of *water* and (c) a detection wavelength of 214 nm.

Calculate the content of $C_6H_8N_2O_8$ in the injection using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS.*

Isosorbide Dinitrate Sublingual Tablets

General Notices

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Isosorbide Dinitrate Sublingual Tablets contain Diluted Isosorbide Dinitrate.

CAUTION Undiluted isosorbide dinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.

The sublingual tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 2 mg of isosorbide dinitrate with 1 ml of *ether* and centrifuge. Prepare solution (2) in the same manner but use *isosorbide dinitrate BPCRS* in place of the powdered tablets. After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 50 mg of isosorbide dinitrate with warm *sulphuric acid (50%)* containing a trace of *diphenylamine.* An intense blue colour is produced.

TESTS

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel H plate* (Merck plates are suitable) and a mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of isosorbide dinitrate with 5 ml of *ethanol (96%)* and filter. For solution (2) dissolve 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (96%).* After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes. Examine in daylight. In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Isosorbide 5-nitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of the mobile phase to a quantity of the powdered tablets containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0005% w/v *of isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase. Solution (4) contains 0.005% w/v each of *isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *aminopropylsilyl silica gel for chromatography* (10 µm) (Lichrosorb NH_2 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 15 volumes of *absolute ethanol* and 85 volumes of *2,2,4-trimethylpentane* and (c) a detection wavelength of 215 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of the mobile phase to a quantity of the powdered tablets containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase. For solution (2) add 20 ml of the mobile phase to a quantity *of isosorbide dinitrate BPCRS* containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the mobile phase. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase. Solution (3) contains 0.005% w/v each *of isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure described under Isosorbide 5-nitrate and isosorbide 2-nitrate may be used but using a detection wavelength of 230 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the resolution factor between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

Calculate the content of $C_6H_8N_2O_8$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

LABELLING

The label states that the tablets should be placed under the tongue and allowed to dissolve slowly.

When Isosorbide Dinitrate Tablets are prescribed or demanded, either Isosorbide Dinitrate Tablets or Isosorbide Dinitrate Sublingual Tablets may be dispensed or supplied, as appropriate.

Isosorbide Dinitrate Tablets

General Notices

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Isosorbide Dinitrate Tablets contain Diluted Isosorbide Dinitrate.

CAUTION Undiluted isosorbide dinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 2 mg of isosorbide dinitrate with 1 ml of *ether* and centrifuge. Prepare solution (2) in the same manner but use *isosorbide dinitrate BPCRS* in place of the powdered tablets. After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 50 mg of isosorbide dinitrate with warm *sulphuric acid (50%)* containing a trace of *diphenylamine*. An intense blue colour is produced.

TESTS

Dissolution

Tablets intended to be swallowed whole comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter through a membrane filter with a nominal pore size not greater than 0.45 µm. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is a solution of *isosorbide dinitrate BPCRS* in the dissolution medium containing the same concentration of isosorbide dinitrate as that expected in the dissolution vessel. Solution (2) is the filtrate from the dissolution vessel.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute, a mixture of equal volumes of *methanol* and *water* and (c) a detection wavelength of 222 nm. Inject 100 µl of each solution.

Calculate the total content of isosorbide dinitrate, $C_6H_8N_2O_8$, in the medium using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel H plate* (Merck plates are suitable) and a mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of isosorbide dinitrate with 5 ml of *ethanol (96%)* and filter. For solution (2) dissolve 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (96%)*. After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes. Examine in daylight. In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Isosorbide 5-nitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of the mobile phase to a quantity of the powdered tablets containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0005% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase. Solution (4) contains 0.005% w/v each of *isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *aminopropylsilyl silica gel for chromatography* (10 µm) (Lichrosorb NH_2 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 15 volumes of *absolute ethanol* and 85 volumes of *2,2,4-trimethylpentane* and (c) a detection wavelength of 215 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

Disintegration

The requirement for Disintegration does not apply to Isosorbide Dinitrate Tablets.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III

D, using the following solutions. For solution (1) add 20 ml of the mobile phase to a quantity of the powdered tablets containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase. For solution (2) add 20 ml of the mobile phase to a quantity of *isosorbide dinitrate BPCRS* containing 25 mg of isosorbide dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the mobile phase. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase. Solution (3) contains 0.005% w/v each of *isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure described under Isosorbide 5-nitrate and isosorbide 2-nitrate may be used but using a detection wavelength of 230 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

Calculate the content of $C_6H_8N_2O_8$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

LABELLING

The label states whether the tablets are to be swallowed whole or chewed before being swallowed.

When Isosorbide Dinitrate Tablets are prescribed or demanded, either Isosorbide Dinitrate Tablets or Isosorbide Dinitrate Sublingual Tablets may be dispensed or supplied, as appropriate.

Isosorbide Mononitrate Tablets

General Notices

Action and use

Nitric oxide analogue; angina pectoris.

DEFINITION

Isosorbide Mononitrate Tablets contain Diluted Isosorbide Mononitrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide mononitrate, $C_6H_9NO_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 plates are suitable) and a mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 10 mg of isosorbide mononitrate with 10 ml of *ethanol (96%)* and filter. Prepare solution (2) in the same manner but using *isosorbide mononitrate BPCRS* in place of the powdered tablets. After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm).* The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Analtech silica gel H plates are suitable) and a mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of isosorbide mononitrate with 5 ml of *ethanol (96%)* and filter. For solution (2) dissolve 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (96%).* After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight. In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Isosorbide dinitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 15 ml of mobile phase to a quantity of the powdered tablets containing 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a membrane filter with a nominal pore size not greater than 0.45 µm and use the filtrate. Solution (2) contains 0.001% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.001% w/v of *isosorbide dinitrate BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octyldecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 30 volumes of *methanol* and 70 volumes of *water* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 70 ml of mobile phase to a quantity of the powdered tablets containing 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes, dilute to 100 ml with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 5 volumes with mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm. For solution (2) add 20 ml of mobile phase to a quantity of *isosorbide mononitrate BPCRS* containing 25 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes, dilute to 25 ml with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 10 volumes with mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm. Solution (3) contains 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure described under Isosorbide dinitrate and isosorbide 2-nitrate may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

Calculate the content of $C_6H_9NO_6$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_9NO_6$ in *isosorbide mononitrate BPCRS*.

Isotretinoin Capsules

General Notices

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Isotretinoin Capsules contain Isotretinoin.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of isotretinoin, $C_{20}H_{28}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (4).

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, in the range 300 to 400 nm, exhibits a maximum at 356 nm.

TESTS

Dissolution

Not less than 85% of the stated amount per capsule after 60 minutes. Protect the apparatus from light throughout the determination and flush the apparatus with nitrogen before use. Carry out the test using the apparatus for the *disintegration test for tablets and capsules*, Appendix XII A1, and 900 ml of 0.1M *sodium hydroxide* as the dissolution medium. Withdraw a 20-ml sample of the medium, filter immediately through a 0.2-µm filter, discarding the first 5 ml of filtrate, and dilute the filtrate with 0.1M *sodium hydroxide* to give a solution expected to contain about 0.00025% w/v of Isotretinoin. Measure the *absorbance* of this solution at 343 nm, Appendix II B, using 0.1M *sodium hydroxide* in the reference cell. Calculate the total content of isotretinoin, $C_{20}H_{28}O_2$, in the medium taking 1490 as the value of A(1%, 1 cm) at 343 nm and divide the result by 6 to obtain the amount per capsule.

Related substances

Protect the solutions from light throughout the procedure. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 10 mg of Isotretinoin with 10 ml of a mixture of 20 volumes of 0.1M *sodium hydroxide* and 80 volumes of *absolute ethanol* for 10 minutes, treat with ultrasound for 15 minutes and centrifuge for 5 minutes. Mix 5 ml of the supernatant liquid with 7.5 ml of 0.1M *hydrochloric acid* and extract with two 20-ml quantities of *dichloromethane*. Filter the combined extracts through phase separating paper (Whatman

1PS is suitable) and wash the filter with 5 ml of *dichloromethane*. Evaporate the combined filtrate and washing to dryness at 30° under reduced pressure and dissolve the residue in 5 ml of *methanol*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. Solution (3) contains 0.002% w/v of *tretinoin EPCRS* in *methanol*. Solution (4) contains 0.001% w/v of *isotretinoin EPCRS* in *methanol*. Solution (5) contains 0.001% w/v of each of *tretinoin EPCRS* and *isotretinoin EPCRS* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.4 ml per minute a 0.5% w/v solution of *glacial acetic acid* in a mixture of *methanol* and *water*, the proportions adjusted to give a retention time for tretinoin of about 15 minutes (a mixture of 23 volumes of *water* and 77 volumes of *methanol* is usually suitable) and (c) a detection wavelength of 353 nm.

Inject 10 µl of each solution and adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with solution (3) is at least 70% of the full scale of the recorder.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to tretinoin and isotretinoin is at least 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to tretinoin is not greater than twice the area of the peak in the chromatogram obtained with solution (3) (4%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any such peaks is not greater than 1.5 times the area of the peak in the chromatogram obtained with solution (2) (1.5%).

ASSAY

Carry out the following procedure in subdued light. Slit 10 capsules with a scalpel avoiding loss of the capsule contents, place the capsules in a 500 ml graduated flask washing any material adhering to the scalpel into the flask with 25 ml of *dichloromethane* per capsule and mix with the aid of ultrasound for 15 minutes. Add sufficient *dichloromethane* to produce 500-ml, shake for 2 minutes and dilute with a solution prepared by diluting 5 ml of 0.1M *hydrochloric acid* to 250 ml with *ethanol (96%)* to produce a solution containing 0.0008% w/v of Isotretinoin. Measure the *absorbance* of this solution at the maximum at 356 nm, Appendix II B, using the ethanolic hydrochloric acid solution in the reference cell. Calculate the content of $C_{20}H_{28}O_2$ in each capsule taking 1350 as the value of A(1%, 1 cm) at the maximum at 356 nm.

STORAGE

Isotretinoin Capsules should be protected from light.

Isotretinoin Gel

General Notices

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Isotretinoin Gel is a solution of Isotretinoin in a suitable alcoholic basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of isotretinoin, $C_{20}H_{28}O_2$

90.0 to 110.0% of the stated amount.

Carry out all the operations as rapidly as possible protected from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 2 volumes of *glacial acetic acid*, 4 volumes of *acetone*, 40 volumes of *peroxide-free ether* and 54 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1), shake to disperse a quantity of the gel containing 1 mg of Isotretinoin as completely as possible in 5 ml of *dichloromethane reagent* and 10 ml of *dichloromethane*, add 80 ml of n-*hexane* and shake the mixture vigorously; filter, evaporate the filtrate to dryness using a rotary evaporator at a temperature not exceeding 60° and dissolve the residue in 1 ml of *dichloromethane*. Solution (2) contains 0.1% w/v of *isotretinoin EPCRS* in *dichloromethane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1), shake to disperse a quantity of the gel containing 2.5 mg of Isotretinoin as completely as possible in a mixture of 5 ml of *dichloromethane reagent* and 10 ml of *dichloromethane*, dilute to 50 ml with n-*hexane*, shake and filter. Solution (2) contains 0.0002% w/v of *tretinoin EPCRS* in n-*hexane*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with n-*hexane*. Solution (4) contains 0.0002% w/v of each of *isotretinoin EPCRS* and *tretinoin EPCRS* in n-*hexane*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si60 is suitable), (b) a mixture of 1 volume of *glacial acetic acid*, 30 volumes of *ethyl acetate* and 970 volumes of n-*hexane* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 365 nm.

Inject 50 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.0.

In the chromatogram obtained with solution (1) the area of any peak due to tretinoin is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (4%) and the sum of the areas of any other *secondary peaks* is not greater than the area of the peak in the chromatogram obtained with solution (3) (1%).

ASSAY

Carry out the following procedure in subdued light. To a quantity of the gel containing 0.5 mg of isotretinoin, add 10 ml of *dichloromethane*, shake until all the gel has dispersed and dilute the solution to 100 ml with a solution prepared by diluting 5 ml of 0.1M *hydrochloric acid* to 250 ml with *ethanol (96%)*. Measure the *absorbance* of this solution at the maximum at 356 nm, Appendix II B, using the ethanolic hydrochloric acid solution in the reference cell. Calculate the content of $C_{20}H_{28}O_2$ in the gel taking 1350 as the value of A(1%, 1 cm) at the maximum at 356 nm.

Ispaghula Husk Effervescent Granules

General Notices

DEFINITION

Ispaghula Husk Effervescent Granules contain Ispaghula Husk in a suitable, effervescent basis.

The granules comply with the requirements stated under Granules and with the following requirements.

TESTS

Disintegration

Carry out the test stated under Effervescent Granules with the following modifications. Stir the contents of the beaker occasionally to disperse the mucilage formed; evolution of gas is complete after 5 minutes.

Swelling index

Not less than 40, Appendix XI C. Use a quantity of the powdered granules containing 1.0 g of Ispaghula Husk and a 100 ml ground-glass-stoppered cylinder graduated in 1 ml divisions.

Ispaghula Husk Granules

General Notices

DEFINITION

Ispaghula Husk Granules contain Ispaghula Husk with or without suitable excipients.

The granules comply with the requirements stated under Granules and with the following requirements.

IDENTIFICATION

A. Powder the granules and examine under a microscope using *lactic reagent*. Fragments of the episperm with polygonal cells filled with mucilage and fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm are seen.

B. When mounted in *ruthenium red solution*, the particles of the powder are stained red.

TESTS

Swelling index

Not less than 40, Appendix XI C. Use a quantity of the granules containing 1.0 g of Ispaghula Husk and a 100-ml ground-glass-stoppered cylinder graduated in 1 ml divisions.

Loss on drying

When dried at 100° to 105°, loses not more than 12.0% of its weight. Use 1 g.

Ash

Not more than 5.0%, Appendix XI J, Method II.

STORAGE

Ispaghula Husk Granules should be protected from moisture.

Ispaghula Husk Oral Powder

General Notices

DEFINITION

Ispaghula Husk Oral Powder contains Ispaghula Husk with or without suitable excipients.

The powder complies with the requirements stated under Oral Powders and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a suitable silica gel as the coating substance and a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* as the mobile phase. Apply separately to the plate, as bands, 10 µl of each of the following solutions. For solution (1) add 2 ml of a 23% w/v solution of *trifluoroacetic acid* to a quantity of the powder containing 10 mg of Ispaghula Husk in a thick-walled centrifuge tube, shake vigorously, close the tube and heat at 120° for 1 hour. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 ml flask, add 10 ml of *water* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 ml of *water*, again evaporate to dryness under reduced pressure and take up the residue in 2 ml of *methanol*. For solutions (2), (3) and (4) dissolve, separately, 10 mg of *arabinose*, 10 mg of *xylose* and 10 mg of *galactose* in small quantities of *water* and dilute each solution to 10 ml with *methanol*. After removal of the plate, allow it to dry in air, spray with *aminohippuric acid reagent*, heat at 120° for 5 minutes and examine in daylight. The chromatogram obtained with solution (1) shows two orange-pink zones (arabinose and xylose) and a yellow zone (galactose) similar in position and colour to the zones in the chromatograms obtained with solutions (2), (3) and (4).

B. When mounted in *ruthenium red solution*, the particles of the powder are stained red.

TESTS

Swelling index

Not less than 40, Appendix XI C. Use a quantity of the oral powder containing 1.0 g of Ispaghula Husk and a 100 ml ground-glass-stoppered cylinder graduated in 1 ml divisions.

Ash

Not more than 4.0%, Appendix XI J, Method II. Use a quantity of the powder containing 1 g of Ispaghula Husk.

STORAGE

Ispaghula Husk Oral Powder should be protected from moisture.

Isradipine Tablets

General Notices

Action and use

Calcium channel blocker.

DEFINITION

Isradipine Tablets contain Isradipine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isradipine, $C_{19}H_{21}N_3O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 3 mg of Isradipine with 70 ml of *methanol (80%)* for 10 minutes, dilute to 100 ml with the same solvent and filter. The *light absorption* of the filtrate, Appendix II B, in the range 250 to 450 nm exhibits a maximum at 326 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of a 0.1% w/v solution of N,N-*dimethyldodecylamine* N-*oxide* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 5 volumes of a 0.01% w/v solution *of isradipine BPCRS* in *methanol (80%)* to 100 volumes with a 0.1% w/v solution of N,N-*dimethyldodecylamine* N-*oxide.* Use the filtered dissolution medium as solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Brownlee Spheri ODS 5µ is suitable), (b) *methanol (80%)* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 326 nm. Inject 50 µl of each solution.

Calculate the content of $C_{19}H_{21}N_3O_5$ in the medium using the declared content of $C_{19}H_{21}N_3O_5$ in *isradipine BPCRS*.

Related substances

Carry out the test protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol (80%)* to a number of whole tablets containing 50 mg of Isradipine, shake for 1 hour, centrifuge the resulting mixture and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 400 volumes with *methanol (80%).* Solution (3) contains 0.0009% w/v *of isradipine impurity B BPCRS* in the mobile phase. Solution (4) contains 0.0005% w/v of *isradipine impurity D* in the mobile phase. Solution (5) contains 0.010% w/v each of *isradipine impurity D BPCRS* and *isradipine BPCRS* in *methanol (80%).* For solution (1) allow the chromatography to proceed for 5 times the retention time of the principal peak.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Brownlee Spheri ODS 5µ is suitable), (b) as the mobile phase a mixture of 125 volumes of *acetonitrile*, 270 volumes of *tetrahydrofuran* and 625 volumes of *water* with a flow rate of 1.2 ml per minute and (c) a detection wavelength of 230 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the two principal peaks is at least 1.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.25%), the area of any peak corresponding to isradipine impurity B is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.9%), and the area of any peak corresponding to isradipine impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (4) (0.5%). Calculate the percentage content of isradipine impurity B and isradipine impurity D using the respective reference solutions and the content of any unnamed impurities using solution (2). The total nominal content of impurities is not greater than 2%.

ASSAY

Carry out the assay protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol (80%)* to a number of whole tablets containing 50 mg of Isradipine, shake for 1 hour, centrifuge the resulting mixture and dilute a volume of the clear supernatant liquid with *methanol (80%)* to produce a solution containing 0.010% w/v of Isradipine. Solution (2) is a 0.010% w/v solution of *isradipine BPCRS* in *methanol (80%).* Solution (3) is a 0.010% w/v solution of *isradipine impurity D BPCRS* in solution (2).

The chromatographic procedure described under Related substances may be used.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.5.

Calculate the content of $C_{19}H_{21}N_3O_5$ in the tablets using the declared content of $C_{19}H_{21}N_3O_5$ in *isradipine BPCRS*.

STORAGE

Isradipine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Isradipine.

Paediatric Ipecacuanha Emetic Mixture

General Notices

Paediatric Ipecacuanha Emetic; Paediatric Ipecacuanha Emetic Oral Solution

DEFINITION

Paediatric Ipecacuanha Emetic Mixture is an *oral solution*.

Ipecacuanha Liquid Extract	70 ml
Hydrochloric Acid	2.5 ml
Glycerol	100 ml
Syrup	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of total alkaloids

0.12 to 0.16% w/v, calculated as emetine, $C_{29}H_{40}N_2O_4$.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 90 volumes of *chloroform* and 10 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) mix 5 ml with 10 ml of 1M *sulphuric acid*, shake with two 10 ml quantities of *chloroform* and discard the chloroform. Add sufficient 5M *ammonia* to make the aqueous solution distinctly alkaline to *litmus paper*, extract with four 10 ml quantities of *chloroform*, evaporate the combined extracts to dryness, cool the residue and dissolve it in 0.5 ml of *ethanol (96%)*. Solution (2) contains 0.1% w/v of *cephaeline hydrochloride EPCRS* in *ethanol (96%)*. Solution (3) contains 0.1% w/v of *emetine hydrochloride EPCRS* in *ethanol (96%)*. After removal of the plate, dry it at 105° to 110° for 30 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*. The principal spots in the chromatogram obtained with solution (1) correspond in colour and position to the spots in the chromatograms obtained with solutions (2) and (3). Disregard any *secondary spots*.

ASSAY

To 25 ml in a separating funnel add 20 ml of *water* and 5 ml of 1M *sulphuric acid*, shake with three 10 ml quantities of *chloroform* and wash each chloroform extract with a mixture of 20 ml of 0.05M *sulphuric acid* and 4 ml of *ethanol (96%)* contained in a second separating funnel. Transfer the acid–ethanol mixture from the second separating funnel to the first, make the combined liquids distinctly alkaline to *litmus paper* with 5M *ammonia* and extract with successive quantities of *chloroform* until *complete extraction* of the alkaloids is effected, Appendix XI G. Wash each chloroform extract with the same 10 ml of *water*, combine the chloroform extracts, evaporate the chloroform, add 2 ml of *ethanol (96%)* to the residue, evaporate to dryness and dry the residue at 80° in a current of air for 5 minutes. Dissolve the residue in 2 ml of *ethanol (96%)* previously neutralised to *methyl red solution*, add 10 ml of 0.01M *sulphuric acid VS* and titrate the excess of acid with 0.02M *sodium hydroxide VS* using *methyl red solution* as indicator. Each ml of 0.01M *sulphuric acid VS* is equivalent to 4.806 mg of $C_{29}H_{40}N_2O_4$.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Prolonged-release Isosorbide Mononitrate Tablets

General Notices

Prolonged-release Isosorbide Mononitrate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Prolonged-release Isosorbide Mononitrate Tablets contain Diluted Isosorbide Mononitrate. They are formulated so that the medicament is released over a period of several hours. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of isosorbide mononitrate. The dissolution profile reflects the *in vivo* performance, which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide mononitrate, $C_6H_9NO_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 plates are suitable) and a mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing the equivalent of 10 mg of isosorbide mononitrate with 10 ml of *ethanol (96%)* and filter. Prepare solution (2) in the same manner but using *isosorbide mononitrate BPCRS* in place of the preparation being examined. After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm).* The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Analtech silica gel H plates are suitable) and a mixture of 15 volumes of *glacial acetic* *acid*, 30 volumes of *acetone* and 60 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 0.1 g of isosorbide mononitrate with 5 ml of *ethanol (96%)* and filter. For solution (2) dissolve 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (96%)*. After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight. In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Isosorbide dinitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 15 ml of mobile phase to a quantity of the powdered tablets containing the equivalent of 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 ml with the same solvent. Filter through a membrane filter with a nominal pore size not greater than 0.45 µm and use the filtrate. Solution (2) contains 0.001% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.001% w/v of *isosorbide dinitrate BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 30 volumes of *methanol* and 70 volumes of *water* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 70 ml of mobile phase to a quantity of the powdered tablets containing the equivalent of 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 100 ml with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 5 volumes with the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm. Solution (2) contains 0.01% w/v of *isosorbide mononitrate BPCRS* in the mobile phase. Solution (3) contains 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure described under Isosorbide dinitrate and isosorbide 2-nitrate may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

Calculate the content of $C_6H_9NO_6$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_9NO_6$ in *isosorbide mononitrate BPCRS*.

Protamine Zinc Insulin Injection

General Notices

Protamine Zinc Insulin

Action and use

Antidote to heparin.

DEFINITION

Protamine Zinc Insulin Injection is a sterile buffered suspension of bovine, porcine or human insulin complexed with Protamine Sulphate or another suitable protamine and Zinc Chloride or another suitable zinc salt.

The injection complies with the requirements stated under Insulin Preparations and with the following requirements.

PRODUCTION

Protamine Zinc Insulin Injection is prepared by carrying out the procedures described under Insulin Preparations. A suitable protamine is added in the proportion of 1.0 to 1.7 mg of protamine sulphate per 100 IU of insulin.

DESCRIPTION

A white suspension which on standing deposits a white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by shaking. When examined under a microscope, approximately 50% of the particles are seen to have no uniform shape, with a maximum diameter rarely exceeding 2 µm. The remaining particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 10 µm but rarely exceeding 100 µm.

IDENTIFICATION

In the Assay the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the appropriate reference solution.

Total zinc

20 to 25 mg per 100 IU of insulin, determined as described under Insulin Preparations.

Kaolin and Morphine Mixture

General Notices

Kaolin and Morphine Oral Suspension

DEFINITION

Kaolin and Morphine Mixture is an *oral suspension* containing 20% w/v of Light Kaolin or Light Kaolin (Natural), 5% w/v of Sodium Bicarbonate and 4% v/v of Chloroform and Morphine Tincture in a suitable vehicle.

It should be recently prepared unless the kaolin has been sterilised.

Extemporaneous preparation

The following formula applies.

Light Kaolin or Light Kaolin (Natural)	200 g
Sodium Bicarbonate	50 g
Chloroform and Morphine Tincture	40 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$

4.65 to 5.35% w/v.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.0055 to 0.0080% w/v.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 70 volumes of *toluene*, 20 volumes of *ethyl acetate* and 10 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) centrifuge 10 ml of the preparation, reserving the supernatant liquid. Extract the residue with four 10 ml quantities of a mixture of 38 ml of *acetone* and 2 ml of 5M *ammonia*, centrifuging between each extraction, and evaporate the combined extracts on a water bath to about 5 ml. Mix with the reserved supernatant liquid, add 10 ml of 1M *sulphuric acid*, shake with two 10 ml quantities of *chloroform* and discard the chloroform. Add sufficient 5M *ammonia* to make the aqueous solution alkaline to *litmus paper*, extract with three 10 ml quantities of a mixture of equal volumes of *chloroform* and *ethanol (96%)*, evaporate to dryness and dissolve the residue in 0.5 ml of *ethanol (96%)*. Solution (2) contains 0.10% w/v of *morphine hydrochloride*. After removal of the plate, heat it at 105° to 110° for 30 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*.

The principal spot in the chromatogram obtained with solution (1) corresponds in colour and position to that in the chromatogram obtained with solution (2).

TESTS

Acid-insoluble matter

13.8 to 18.4% w/w when determined by the following method. To 3 g add 15 ml of *water*, cautiously add sufficient 2M *hydrochloric acid* to make the suspension acidic to *litmus paper*, boil for 5 minutes, replacing the water lost by evaporation, cool and filter the supernatant liquid. Boil the residue with 20 ml of *water* and 10 ml of 2M *hydrochloric acid*, cool, filter through the same filter and wash the residue with *water* until the washings are free from chloride. Dry and ignite the residue to constant weight at red heat.

ASSAY

For sodium bicarbonate

Boil 20 ml with 40 ml of *water* for 5 minutes, replacing the water lost by evaporation, add 50 ml of *ethanol (96%)* previously neutralised to *methyl red solution* and allow to stand for 1 hour. Filter and wash the residue with 100 ml of a mixture of equal volumes of the neutralised ethanol and *water*. Add 50 ml of 0.5M *hydrochloric acid VS* to the combined filtrate and washings, boil, cool and titrate the excess of hydrochloric acid with 0.5M *sodium hydroxide VS* using *methyl red solution* as indicator. Each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

For anhydrous morphine

Centrifuge 25 ml, reserving the supernatant liquid, and extract the residue with three 25 ml quantities of *ethanol (96%)*, centrifuging between each extraction and reserving each supernatant liquid. Add 40 ml of *water* and 7 ml of 5M *ammonia* to the combined supernatant liquids and extract the mixture with three 30 ml quantities of *chloroform*. Gently shake each extract with the same 15 ml of a mixture of 2 volumes of *water* and 1 volume of *ethanol (96%)* and discard the aqueous ethanol. Evaporate the combined chloroform solutions just to dryness, warm the residue with 10 ml of 1M *hydrochloric acid*, cool the solution, which may be slightly cloudy, add sufficient *water* to produce 50 ml and filter (Whatman No. 42 paper is suitable). To 20 ml of the filtrate add 8 ml of a freshly prepared 1% w/v solution of *sodium nitrite*, allow to stand in the dark for 15 minutes, add 12 ml of 5M *ammonia* and sufficient *water* to produce 50 ml and measure the *absorbance* of a 4-cm layer at 442 nm without delay, Appendix II B. Use in the reference cell a solution prepared in the same manner but using *water* in place of the sodium nitrite solution. Calculate the content of anhydrous morphine taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

STORAGE

Kaolin and Morphine Mixture should be kept in well-filled glass containers.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Kaolin Mixture

General Notices

Kaolin Oral Suspension

DEFINITION

Kaolin Mixture is an *oral suspension* containing 20% w/v of Light Kaolin or Light Kaolin (Natural) and 5% w/v each of Light Magnesium Carbonate and Sodium Bicarbonate in a suitable vehicle with a peppermint flavour.

It should be recently prepared unless the kaolin has been sterilised.

Extemporaneous preparation

The following formula applies.

Light Kaolin or Light Kaolin (Natural)	200 g
Light Magnesium Carbonate	50 g
Sodium Bicarbonate	50 g
Concentrated Peppermint Emulsion	25 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium, Mg

1.04 to 1.25% w/w.

Content of sodium bicarbonate, $NaHCO_3$

4.05 to 4.65% w/w.

TESTS

Acid-insoluble matter

13.8 to 18.4% w/w when determined by the following method. Dry and ignite the residue reserved in the Assay for magnesium to constant weight at red heat.

ASSAY

For magnesium

To 3 g add 15 ml of *water*, make acidic to *litmus paper* by the cautious addition of 2M *hydrochloric acid*, boil for 5 minutes, replacing the water lost by evaporation, cool and filter the supernatant liquid. Boil the residue with 20 ml of *water* and 10 ml of 2M *hydrochloric acid*, cool, filter through the same filter and wash the residue with *water* until the washings are free from chloride. Reserve the residue for the test for Acid-insoluble matter. Dilute the combined filtrate and washings to 100 ml with *water*. To 20 ml add 0.1 g of L-*ascorbic acid*, make slightly alkaline to *litmus paper* with 5M *ammonia* and add 10 ml of *triethanolamine*, 10 ml of *ammonia buffer pH 10.9* and 1 ml of a 10% w/v solution of *potassium cyanide*. Titrate with 0.05M *disodium edetate VS*, using *mordant black 11 solution* as indicator, to a full blue colour. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg.

For sodium bicarbonate

Boil 10 g with 100 ml of *water* for 5 minutes, filter, boil the residue with 100 ml of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange-xylene cyanol FF solution* as indicator. Add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Kaolin Poultice

General Notices

DEFINITION

Heavy Kaolin[1], finely sifted	527 g
Boric Acid, finely sifted	45 g
Methyl Salicylate	2 ml
Thymol	500 mg
Peppermint Oil	0.5 ml
Glycerol	425 g

Extemporaneous preparation

The following directions apply.

Mix the Heavy Kaolin, previously dried at 100°, and the Boric Acid with the Glycerol, heat at 120° for 1 hour, stirring occasionally, and allow to cool. Separately, dissolve the Thymol in the Methyl Salicylate, add to the cooled mixture, add the Peppermint Oil and mix thoroughly.

The heating step may be omitted if some other satisfactory means of mixing the solid ingredients with the Glycerol is used but in this case Heavy Kaolin that has been sterilised is used.

The poultice complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of boric acid, H_3BO_3

4.25 to 4.75% w/w.

ASSAY

Mix 20 g with a solution containing 10 g of D-*mannitol* in 40 ml of *water*, warm and stir until completely dispersed and titrate with 1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each ml of 1M *sodium hydroxide VS* is equivalent to 61.83 mg of H_3BO_3.

STORAGE

Kaolin Poultice should be kept in suitable containers that minimise absorption, diffusion or evaporation of the ingredients.

---

[1] If an appropriate heating step, such as that described under Extemporaneous preparation, is not included in the manufacturing process, Heavy Kaolin that has been sterilised is used.

Ketamine Injection

General Notices

Action and use

Intravenous general anaesthetic.

DEFINITION

Ketamine Injection is a sterile solution of Ketamine Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ketamine hydrochloride, $C_{13}H_{16}ClNO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the injection with a mixture of 1 volume of 1M *sodium hydroxide* and 49 volumes of *methanol* to produce a solution containing 0.08% w/v of ketamine hydrochloride. The *light absorption*, Appendix II B, in the range 230 to 350 nm of this solution exhibits a maximum at 301 nm and shoulders at 274, 268 and 261 nm.

B. Dilute a volume of the injection with 0.1M *hydrochloric acid* to produce a solution containing 0.029% w/v of ketamine hydrochloride. The *light absorption*, Appendix II B, in the range 230 to 350 nm of this solution exhibits two maxima at 276 nm and at 269 nm and a shoulder at 260 nm.

TESTS

Acidity

pH, 3.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, with the mobile phase to produce a solution containing 0.12% w/v of ketamine hydrochloride. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. For solution (3) dilute 1 volume of solution (2) to 2 volumes with the mobile phase. For solution (4) add 2 volumes of a 0.05% w/v solution of *ketamine impurity A EPCRS* in the mobile phase to 1 volume of solution (1) and dilute to 100 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.0 mm) and a stainless steel pre-column (4 mm × 4.0 mm), both packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 5µ is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture prepared by dissolving 0.95 g of *sodium hexanesulphonate* in 1 litre of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water* and adding 4 ml of 6M *acetic acid* and (c) a detection wavelength of 215 nm.

Inject solution (4). When the chromatograms are recorded in the prescribed conditions, the retention time is about 3 to 4.5 minutes for ketamine. The test is not valid unless the *resolution factor* between the peaks due to ketamine and ketamine impurity A is at least 1.5. If necessary, adjust the concentrations of water and acetonitrile in the mobile phase.

Inject solutions (1), (2) and (3). Continue the chromatography for 10 times the retention time of ketamine. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of not more than one such peak is greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.25%). Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Dilute a volume of the injection containing 25 mg of Ketamine Hydrochloride to 100 ml with 0.05M *hydrochloric acid* and mix. Measure the *absorbance* of the resulting solution at the maximum at 269 nm, Appendix II B. Measure the *absorbance* of a 0.025% w/v solution of *ketamine hydrochloride BPCRS* in 0.05M *hydrochloric acid* at the same wavelength.Calculate the content of $C_{13}H_{16}ClNO,HCl$ using the declared content of $C_{13}H_{16}ClNO,HCl$ in *ketamine hydrochloride BPCRS*.

STORAGE

Ketamine Injection should be protected from light and stored at a temperature not exceeding 30°.

Ketoprofen Capsules

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ketoprofen Capsules contain Ketoprofen.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ketoprofen, $C_{16}H_{14}O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing 0.5 g of Ketoprofen with 50 ml of *chloroform* for 5 minutes, filter, evaporate to dryness using a rotary evaporator and induce crystallisation by prolonged scratching of the side of the container with a glass rod. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of ketoprofen *(RS 198)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of a phosphate buffer prepared by dissolving 1.46 g of *potassium dihydrogen orthophosphate* and 20.06 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml, adjusting the pH to 7.5 if necessary with *orthophosphoric acid*, and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.001% w/v of Ketoprofen. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 260 nm using dissolution medium in the reference cell. Calculate the total content of ketoprofen, $C_{16}H_{14}O_3$, in the medium taking 662 as the value of A(1%, 1 cm) at the maximum at 260 nm.

Related substances

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Ketoprofen with 100 ml of a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water* (solvent A), filter and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 50 volumes with solvent A and further dilute 1 volume to 10 volumes with solvent A. Solution (3) contains 0.0002% w/v of *impurity C EPCRS* (2-(3-carboxyphenyl)propionic acid) in solvent A. Solution (4) contains 0.0003% w/v of *impurity A EPCRS* (3-acetyl-benzophenone) in solvent A. For solution (5) dilute 1 volume of solution (1) to 100 volumes with solvent A; to 1 ml add 1 ml of solution (4).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) a mixture of 2 volumes of freshly prepared *phosphate buffer pH 3.5*, 43 volumes of *acetonitrile* and 55 volumes of *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 233 nm.

Inject 20 µl of solution (5). The test is not valid unless the *resolution factor* between the peaks due to ketoprofen and 3-acetylbenzophenone is at least 7.

Inject separately 20 µl of solutions (1) to (4). Allow the chromatography to proceed for seven times the retention time of ketoprofen. In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(3-carboxyphenyl)propionic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%), the area of any peak corresponding to 3-acetylbenzophenone is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.3%), the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of all the *secondary peaks* other than those due to the two named impurities is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 50 mg of Ketoprofen for 10 minutes with 300 ml of *methanol (75%)*, mix and dilute to 500 ml with *methanol (75%)*. Allow to stand, dilute 5 ml of the supernatant liquid to 100 ml with *methanol (75%)* and measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{16}H_{14}O_3$ taking 662 as the value of A(1%, 1 cm) at the maximum at 258 nm.

Ketoprofen Gel

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ketoprofen Gel is a solution of Ketoprofen in a suitable water-miscible basis.
The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ketoprofen, $C_{16}H_{14}O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (3).

TESTS

Acidity or alkalinity

pH of a 1% w/v dispersion of the gel in *carbon dioxide-free water*, 5.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *formic acid*, 25 volumes of *toluene* and 75 volumes of *di-isopropyl ether* as the mobile phase. Apply separately to the plate 25 µl of each of the following solutions. For solution (1) shake a quantity of the gel containing 40 mg of Ketoprofen with 5 ml of *methanol* for 15 minutes, centrifuge the mixture for 5 minutes and use the supernatant liquid. Solution (2) contains 0.032% w/v of *ketoprofen ethyl ester BPCRS* in *methanol*. Solution (3) contains 0.8 % w/v of *ketoprofen BPCRS* in *methanol*. Solution (4) contains 0.004% w/v of *ketoprofen BPCRS* in *methanol*. Solution (5) contains 0.0016% w/v of *ketoprofen BPCRS* in *methanol*. After removal of the plate, dry it at 105° for 1 hour and examine under *ultraviolet light (254 nm)*. Spray the plate with a 0.4% w/v solution of *2,4-dinitrophenylhydrazine* in *methanol* containing 5% v/v of *hydrochloric acid* and dry the plate at 105° for 30 minutes. Spray the plate with a mixture of 10 volumes of *tetraethylammonium hydroxide solution* and 10 volumes of *methanol*, dry the plate at 105° for 5 minutes and examine in daylight. By each method of visualisation any spot corresponding to ketoprofen ethyl ester in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) (4%), any other *secondary spot* is not more intense than the principal spot in the chromatogram obtained with solution (4) (0.5%) and not more than three such spots are more intense than the principal spot in the chromatogram obtained with solution (5) (0.2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the gel containing 10 mg of Ketoprofen with 50 ml of *methanol* for 15 minutes, centrifuge the mixture for 5 minutes, dilute 25 ml of the supernatant liquid with sufficient of a mixture of 270 ml of *acetonitrile* and 550 ml of a 0.5% w/v solution of *ammonium acetate* to produce 100 ml and mix. For solution (2) add 19 ml of *methanol* to 5 ml of a 0.1% w/v solution of *ketoprofen BPCRS* in *methanol*, add sufficient of a mixture of 270 ml of *acetonitrile* and 550 ml of a 0.5% w/v solution of *ammonium acetate* to produce 100 ml and mix.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 450 volumes of a solution containing 40% v/v of *methanol* and 60% v/v of *acetonitrile* and 550 volumes of a 0.5% w/v solution of *ammonium acetate*, adjusted to pH 5.9 by the addition of 10% w/w *nitric acid* and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{16}H_{14}O_3$ in the gel using the declared content of $C_{16}H_{14}O_3$ in *ketoprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include ketoprofen ethyl ester and impurities A, B, E and F listed under Ketoprofen.

Labetalol Injection

General Notices

Action and use

Alpha- and beta-adrenoceptor antagonist.

DEFINITION

Labetalol Injection is a sterile solution of Labetalol Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of labetalol hydrochloride, $C_{19}H_{24}N_2O_3$,HCl

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Mix a volume containing 50 mg of Labetalol Hydrochloride with 50 ml of 0.1M *hydrochloric acid* and heat on a water bath for 30 minutes. Cool, filter, add 10 ml of *ammonia buffer pH 10.0* and extract with three 15 ml quantities of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of labetalol *(RS 199)*.

B. The *light absorption*, Appendix II B, in the range 250 to 400 nm of a 0.004% w/v solution of the residue obtained in test A in 0.1M *sodium hydroxide* exhibits a maximum only at 333 nm.

TESTS

Acidity

pH, 3.5 to 4.5, Appendix V L.

Diastereoisomer ratio

Examine by *gas chromatography*, Appendix III B, using a solution prepared in the following manner. Dilute a volume of the injection containing 20 mg of Labetalol Hydrochloride with *ethanol (96%)* to about 10 ml and evaporate to dryness using a rotary evaporator. Dissolve 2.0 mg of the residue in 1 ml of a 1.2% w/v solution of *1-butaneboronic acid* in *anhydrous pyridine* and allow to stand for 20 minutes.

The chromatographic procedure may be carried out using (a) a glass column (1.5 m × 4 mm) packed with *silanised diatomaceous support* (125 µm to 150 µm) impregnated with 3% w/w of *polymethylphenylsiloxane*, (b) *nitrogen for chromatography* as the carrier gas, (c) a flame-ionisation detector, maintaining the temperature of the column, the injection port and the detector at 300°. Inject 2 µl of the solution.

Two peaks each corresponding to a pair of diastereoisomers appear in the chromatogram. Adjust the sensitivity of the detector so that in the chromatogram obtained, the height of the taller of the diastereoisomer peaks is about 80% of the full scale of the recorder. The test is not valid unless the height of the trough separating these peaks is less than 5% of the full scale of the recorder. The area of each peak is not less than 45% and not more than 55% of the total area of both peaks.

Free carboxylic acid and other related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of 13.5M *ammonia*, 25 volumes of *methanol* and 75 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) dilute a volume of the injection containing 80 mg of Labetalol Hydrochloride to about 50 ml with *ethanol (96%)*, evaporate to dryness using a rotary evaporator and dissolve the residue in 1 ml of *methanol*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.160% w/v of *5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino)-ethyl]salicylic acid hydrochloride BPCRS* in *methanol*. After removal of the plate, dry it in a current of warm air, heat at 105° for 30 minutes, cool and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to 5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino) ethyl]salicylic acid is not more intense that the spot in the chromatogram obtained with solution (3) (2%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Dilute a volume containing 50 mg of Labetalol Hydrochloride to 100 ml with *water*. To 10 ml of the solution add 10 ml of 0.05M *sulphuric acid* and dilute to 100 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2O_3$,HCl taking 86 as the value of A(1%, 1 cm) at the maximum at 302 nm.

STORAGE

Labetalol Injection should be protected from light.

Labetalol Tablets

General Notices

Action and use

Alpha- and beta-adrenoceptor antagonist.

DEFINITION

Labetalol Tablets contain Labetalol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of labetalol hydrochloride, $C_{19}H_{24}N_2O_3,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 50 mg of Labetalol Hydrochloride add 50 ml of 0.1M *hydrochloric acid* and heat on a water bath for 30 minutes. Cool, filter, add 10 ml of *ammonia buffer pH 10.0* and extract with three 15 ml quantities of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of labetalol *(RS 199)*.

B. The *light absorption*, Appendix II B, in the range 250 to 400 nm of a 0.004% w/v solution in 0.1M *sodium hydroxide* of the residue obtained in test A exhibits a maximum only at 333 nm.

TESTS

Diastereoisomer ratio

Comply with the test described under Labetalol Injection using 2 mg of the residue prepared in the following manner. Shake a quantity of the powdered tablets containing 0.5 g of Labetalol Hydrochloride with 10 ml of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of 13.5M *ammonia*, 25 volumes of *methanol* and 75 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.5 g of Labetalol Hydrochloride with 10 ml of *methanol*, filter and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. For solution (3) dilute 1 volume of solution (2) to 2 volumes with *methanol*. After removal of the plate, dry it in a current of warm air, heat at 105° for 30 minutes, cool and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing 1 g of Labetalol Hydrochloride with 250 ml of 0.05M *sulphuric acid* for 30 minutes. Dilute the mixture to 500 ml with 0.05M *sulphuric acid*, mix, filter and dilute 10 ml of the filtrate to 250 ml with 0.05M *sulphuric acid*. Measure the *absorbance* of the resulting solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2O_3$,HCl taking 86 as the value of A (1%, 1 cm) at the maximum at 302 nm.

Lacidipine Tablets

General Notices

Action and use

Calcium channel blocker.

DEFINITION

Lacidipine Tablets contain Lacidipine. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lacidipine, $C_{26}H_{33}NO_6$

95.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light and prepare solutions immediately before use.

IDENTIFICATION

A. Shake a quantity of whole tablets containing 4 mg of Lacidipine with 50 ml of *absolute ethanol* with the aid of ultrasound for 30 minutes. Dilute to 100 ml with *absolute ethanol* and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). The *light absorption* of the filtrate, Appendix II B, in the range 250 to 400 nm exhibits maxima only at 284 nm and 368 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use as the medium 500 ml of a solution prepared by mixing 100 ml of *water* with 10 ml of *polysorbate 20*, shaking gently and diluting to 1000 ml with *water* at a temperature of 37°.

PROCEDURE

(1) After 45 minutes, withdraw a sample of 10 ml of the medium and filter immediately through a 0.45-µm membrane filter (Millipore Millex is suitable), having first activated the filter with 3 ml of *methanol* followed by 5 ml of a 1% w/v solution of *polysorbate 20*. Measure the *absorbance* of the filtrate in a 2-cm cell, suitably diluted with the dissolution medium if necessary, at the maximum at 284 nm, Appendix II B, using the dissolution medium in the

reference cell.

(2) Measure the *absorbance,* in a 2 cm cell, of a solution of *lacidipine BPCRS* prepared by diluting a 0.02% w/v solution in *absolute ethanol* to a suitable volume with the dissolution medium at the maximum at 284 nm, Appendix II B, using the dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of lacidipine, $C_{26}H_{33}NO_6$, in the medium using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS*.

Related substances

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Lacidipine with 50 ml of *absolute ethanol* with the aid of ultrasound for 15 minutes. Cool, dilute to 100 ml with *absolute ethanol*, filter through a 0.45-µm membrane filter (Millipore Millex is suitable) and dilute 5 volumes of the filtrate to 20 volumes with *hexane*.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 1 volume of a 0.1% w/v solution of *lacidipine impurity standard BPCRS* in *absolute ethanol* to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Spherisorb CN is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µl of each solution.

(g) If necessary adjust the composition of the mobile phase so that, in the chromatogram obtained with solution (3), the retention time of the peak due to lacidipine is about 10 minutes.

(h) For solution (1) allow the chromatography to proceed for 2 times the retention time of the principal peak.

MOBILE PHASE

3 volumes of *absolute ethanol* and 97 volumes of n-*hexane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lacidipine impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak due to lacidipine impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%, taking into account the correction factor of 2);

— the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

— the total nominal content of impurities is not greater than 2.5%;

— disregard any peak with a relative retention time of 1.5 with respect to the peak due to lacidipine impurity B.

Uniformity of content

Tablets containing less than 2 mg or 2% of Lacidipine comply with the requirements stated under Tablets using the following method of analysis. Place one tablet in 50 ml of *absolute ethanol*, disperse the tablet completely with the aid of ultrasound for 30 minutes crushing with a glass rod if it does not disintegrate, and mix. Cool and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). If necessary further dilute with *absolute ethanol* to produce a solution containing 0.004% w/v of Lacidipine. Measure the *absorbance* of the resulting solution at the maximum at 368 nm, Appendix II B, using *absolute ethanol* in the reference cell. Calculate the content of $C_{26}H_{33}NO_6$ in each tablet from the *absorbance* obtained from a 0.004% w/v solution of *lacidipine BPCRS* in *absolute ethanol* and using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS.*

ASSAY

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse with the aid of ultrasound 10 whole tablets in 50 ml of *absolute ethanol* for 10 minutes, cool and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). Dilute a quantity of the filtrate with sufficient mobile phase to produce a solution containing 0.01% w/v of Lacidipine.

(2) Dilute 5 volumes of a 0.04% w/v solution of *lacidipine BPCRS* in *absolute ethanol* to 20 volumes with the mobile phase.

(3) Dilute 1 volume of a 0.1% w/v solution of *lacidipine impurity standard BPCRS* in *absolute ethanol* to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lacidipine impurity standard BPCRS*.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{33}NO_6$ in the tablets using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS*.

STORAGE

Lacidipine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Lacidipine.

Lactic Acid Pessaries

General Notices

DEFINITION

Lactic Acid Pessaries are moulded pessaries containing Lactic Acid in a suitable basis.
The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of lactic acid, $C_3H_6O_3$

95.0 to 105.0% of the stated amount.

ASSAY

Weigh five pessaries, melt together by warming and allow to cool, stirring continuously. Dissolve a quantity of the mass containing 1 g of Lactic Acid in 50 ml of *water*, add 50 ml of 0.5M *sodium hydroxide VS*, boil gently for 5 minutes, cool and titrate the excess of alkali with 0.5M *hydrochloric acid VS* using *phenolphthalein solution R1* as indicator. Each ml of 0.5M *sodium hydroxide VS* is equivalent to 45.04 mg of $C_3H_6O_3$.

Lactulose Oral Powder

General Notices

Action and use

Osmotic laxative.

DEFINITION

Lactulose Oral Powder consists of Lactulose with or without lesser amounts of other sugars including lactose and galactose.
The oral powder complies with the requirements stated under Oral Powders and with the following requirements.

Content of lactulose, $C_{12}H_{22}O_{11}$

95.0 to 102.0%.

Dissolve 3 g in carbon dioxide-free water and dilute to 50 ml with the same solvent (solution S).

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *glacial acetic acid*, 15 volumes of a 5% w/v solution of *boric acid*, 20 volumes of *methanol* and 55 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dissolve 50 mg of the oral powder in *water* and dilute to 10 ml with the same solvent. For solution (2) dissolve 50 mg of *lactulose EPCRS* in *water* and dilute to 10 ml with the same solvent. After removal of the plate, dry it at 100° to 105° for 5 minutes and allow to cool. Spray the plate with a 0.1% w/v solution of *1,3-dihydroxynaphthalene* in a mixture of 10 volumes of *sulphuric acid* and 90 volumes of *methanol*. Heat the plate at 110° for 5 minutes. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) is similar in position and size to the principal peak in the chromatogram obtained with solution (3).

C. Dissolve 0.05 g in 10 ml of *water*. Add 3 ml of *cupri-tartaric solution* and heat. A red precipitate is formed.

D. Dissolve 0.125 g in 5 ml of *water*. Add 5 ml of *ammonia*. Heat on a water bath at 80° for 10 minutes. A red colour develops.

E. Complies with the test for Specific optical rotation.

TESTS

Clarity and colour of solution

Solution S is *clear*, Appendix IV A, and not more intensely coloured than *reference solution*

BY_5, Appendix IV B, Method II.

pH

To 10 ml of solution S add 0.1 ml of a saturated solution of *potassium chloride*. The pH of the solution is 3.0 to 7.0, Appendix V L.

Specific optical rotation

Dissolve 1.25 g in *water*, add 0.2 ml of 13. 5M *ammonia* and dilute to 25 ml with *water*. The *specific optical rotation* is –46.0° to –50.0°, Appendix V G.

Related substances

In the Assay, in the chromatogram obtained with solution (1), the sum of the areas of any peaks corresponding to the principal peaks in the chromatograms obtained with solutions 5, 6, 7, 8 and 9 respectively (galactose, lactose, epilactose, tagatose and fructose) is not greater than the area of the peak corresponding to lactulose in the chromatogram obtained with solution (2) (3%).

Methanol

Carry out the method for *head-space gas chromatography*, Appendix III B, Method II. Mix 0.5 ml of *propan-1-ol* with 100 ml of *water*. Dilute 1 ml to 100 ml with *water*. Dilute 5 ml to 50 ml with *water* (internal standard solution). For solution (1) add 1 ml of the internal standard solution and 5 µl of a 0.1% v/v solution of *methanol* to 79 of the oral powder in a 20 ml vial. For solution (2) add 5 µl of a 0.1% v/v solution of *methanol* to 1 ml of the internal standard solution in a 20 ml vial.

The chromatographic procedure may be carried out using (a) a column (2 m × 2 mm) packed with *ethylvinylbenzene–divinylbenzene co-polymer* (180 µm), (b) *helium for chromatography* as the carrier gas at a flow rate of 30 ml per minute and (c) a flame-ionisation detector, maintaining the temperature of the column at 140°, that of the injection port at 200° and that of the detector at 220°. Maintain each solution at 60° for 1 hour, pressurise for 1 minute and transfer onto the column 1 ml of the gaseous phase.

In the chromatogram obtained with solution (1), the ratio of the area of the methanol peak to that of the internal standard peak is not greater than twice the corresponding ratio for the chromatogram obtained with solution (2) (50 ppm, calculated assuming the density of methanol to be 0.79 g/ml at 20°).

Boron

Avoid where possible the use of glassware. Prepare a reference solution as follows. Dissolve 50 mg of *boric acid* in *water* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 100 ml with *water*. Keep in a well-closed polyethylene container. In four polyethylene 25 ml flasks, place 0.50 g of the oral powder dissolved in 2 ml of *water* (solution A), 0.50 g of the oral powder dissolved in 1 ml of the reference solution and 1 ml of *water* (solution B), 1 ml of the reference solution and 1 ml of *water* (solution C) and 2 ml of *water* (solution D). To each flask, add 4 ml of *acetate-edetate buffer solution pH 5.5*. Mix and add 4 ml of freshly prepared *azomethine H solution*. Mix and allow to stand for 1 hour. Measure the *absorbance*, Appendix II B, of solutions A, B and C at 420 nm, using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is at least 0.25. The absorbance of solution B is not less than twice that of solution A (9 ppm of boron).

Lead

Complies with the *limit test for lead in sugars*, Appendix VII (0.5 ppm).

Water

Not more than 2.5%, Appendix IX C, Method I. Use 0.5 g.

Sulphated ash

Not more than 0.1%, Appendix IX A, Method II. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 1 g of the oral powder in 10 ml of *water*, add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25 ml with *water*. For solution (2) add 47.5 ml of *acetonitrile* to 3 ml of solution (1) with gentle heating and dilute to 100 ml with *water*. For solution (3) dissolve 1 g of *lactulose EPCRS* in 10 ml of *water*, add 12.5 ml of *acetonitrile* with gentle heating and dilute to 25 ml with *water*. For solution (4) dissolve 20 mg of *lactulose EPCRS* and 20 mg of *epilactose EPCRS* in 2 ml of *water,* add 2.5 ml of *acetonitrile* with gentle heating and dilute to 5 ml with *water*. For solution (5) dissolve 0.2 g of *galactose* in 20 ml of *water*, add 25 ml of *acetonitrile* with gentle heating and dilute to 50 ml with *water*. For solution (6) dissolve 0.2 g of *lactose* in 20 ml of *water*, add 25 ml of *acetonitrile* with gentle heating and dilute to 50 ml with *water*. For solution (7) dissolve 20 mg of *epilactose EPCRS* in 2 ml of *water*, add 2.5 ml of *acetonitrile* with gentle heating and dilute to 5 ml with *water*. For solution (8) dissolve 0.2 g of *tagatose* in 20 ml of *water*, add 25 ml of *acetonitrile* with gentle heating and dilute to 50 ml with *water*. For solution (9) dissolve 0.2 g of *fructose* in 20 ml of *water*, add 25 ml of *acetonitrile* with gentle heating and dilute to 50 ml with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (5 cm × 4.6 mm) followed by a stainless steel column (15 cm × 4.6 mm), both packed with *aminopropylsilyl silica gel for chromatography* (3 µm) and maintained at 37° to 39°, (b) as mobile phase with a flow rate of 1.0 ml per minute a mixture prepared as follows: dissolve 0.253 g of *sodium dihydrogen orthophosphate* in 220 ml of *water* and add 780 ml of *acetonitrile*, and (c) as detector a refractometer maintained at a constant temperature.

When the chromatograms are recorded in the prescribed conditions, the retention time of lactulose is about 18.3 minutes and retention times relative to lactulose are about 0.38 for tagatose, 0.42 for fructose, 0.57 for galactose, 0.90 for epilactose and 1.17 for lactose.

Inject 20 µl of solution (4). The test is not valid unless the *resolution factor* between the peaks corresponding to lactulose and epilactose is at least 1.3. If necessary, adjust the concentration of *acetonitrile* in the mobile phase to between 75.0% and 82.0% v/v to achieve the prescribed resolution.

Inject separately 20 µl of solution (1) and 20 µl of solution (3) and continue the chromatography for 2.5 times the retention time of lactulose. Calculate the percentage content of $C_{12}H_{22}O_{11}$ (lactulose) from the areas of the peaks and from the declared content of $C_{12}H_{22}O_{11}$ in *lactulose EPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Lactulose.

Lemon Spirit

General Notices

DEFINITION

Terpeneless Lemon Oil	100 ml
Ethanol (96 per cent)	Sufficient to produce 1000 ml

The spirit complies with the requirements stated under Spirits and with the following requirements.

Content of aldehydes

3.45 to 4.60% w/v, calculated as citral, $C_{10}H_{16}O$.

TESTS

Ethanol content

84 to 88% v/v, Appendix VIII F.

Weight per ml

0.814 to 0.823 g, Appendix V G.

ASSAY

Carry out the method for the *determination of aldehydes*, Appendix X K, using 10 ml, omitting the *toluene* and using a volume, not less than 7 ml, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 ml the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each ml of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 76.73 mg of $C_{10}H_{16}O$.

Lemon Syrup

General Notices

DEFINITION

Lemon Spirit	5 ml
Citric Acid Monohydrate	25 g
Invert Syrup	100 ml
Syrup	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Citric Acid Monohydrate in some of the Syrup, add the Invert Syrup, the Lemon Spirit and sufficient Syrup to produce 1000 ml and mix.

CHARACTERISTICS

Lemon Syrup has a weight per ml of about 1.33 g.

The syrup complies with the requirements stated under Oral Liquids and with the following requirements.

Content of citric acid monohydrate, $C_6H_8O_7,H_2O$

2.2 to 2.6% w/v.

ASSAY

Mix 8 g with 100 ml of *water* and titrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 7.005 mg of $C_6H_8O_7,H_2O$. Determine the *weight per ml,* Appendix V G, and calculate the content of $C_6H_8O_7,H_2O$, weight in volume.

Levobunolol Eye Drops

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Levobunolol Eye Drops are a sterile solution of Levobunolol Hydrochloride in Purified Water. *The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.*

Content of levobunolol hydrochloride, $C_{17}H_{25}NO_3,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 350 nm of a solution prepared by diluting the eye drops with *ethanol (96%)* to contain 0.001% w/v of Levobunolol Hydrochloride exhibits two maxima, at 223 nm and at 255 nm and a broad peak at 315 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Related substances

The nominal total amount of related substances determined by tests A and B below is not more than 1.5% of the stated content of Levobunolol Hydrochloride.

A. Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of the following solutions. For solution (1) dilute a suitable volume of the eye drops with the mobile phase to produce a solution containing 0.10% w/v of Levobunolol Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. Solution (3) contains 0.0010% w/v of *disodium edetate* in the mobile phase.

The chromatographic procedure described under Assay may be used.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Determine the sum of the areas of any *secondary peaks*. Disregard any peak corresponding to the principal peak in the chromatogram obtained with solution (3).

B. Carry out test A as described above but using a detection wavelength of 400 nm and injecting solution (1). The area of any peak with a retention time corresponding to that of the principal peak in the chromatogram obtained with solution (2) in test A is not greater than one-fifth of the area of that peak (0.5%, assuming a response factor of 5). Calculate the nominal percentage content of this impurity from the area of the peak in the chromatogram obtained with solution (1) taking one-fifth of the area of the peak in the chromatogram obtained with solution (2) in test A to be equivalent to 0.5%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of the following solutions. For solution (1) dilute a suitable volume of the eye drops with the mobile phase to produce a solution containing 0.005% w/v of Levobunolol Hydrochloride. Solution (2) contains 0.005% w/v of *levobunolol hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase a mixture of 5 volumes of *glacial acetic acid*, 450 volumes of 0.005M *sodium heptanesulphonate* and 550 volumes of *methanol* with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 254 nm.

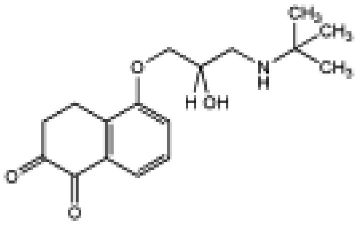
Calculate the content of $C_{17}H_{25}NO_3$,HCl in the eye drops from the declared content of $C_{17}H_{25}NO_3$,HCl in *levobunolol hydrochloride BPCRS*.

STORAGE

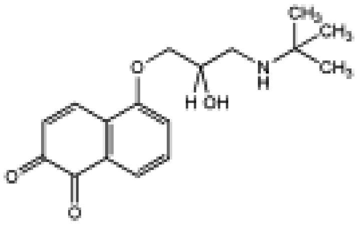
Levobunolol Eye Drops should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include:



A. 5-(3-*tert*-butylamino-2-hydroxypropoxy)-3,4-dihydro-1,2-naphthalene dione,



B. 5-(3-*tert*-butylamino-2-hydroxypropoxy)-1,2-naphthoquinone.

Levodopa Capsules

General Notices

Action and use

Dopamine precursor; treatment of Parkinson's disease.

DEFINITION

Levodopa Capsules contain Levodopa.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of levodopa, $C_9H_{11}NO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve as completely as possible a quantity of the contents of the capsules containing 0.5 g of Levodopa in 25 ml of 1M *hydrochloric acid* and filter. Adjust to pH 3 with 5M *ammonia*, added dropwise with stirring, and allow to stand for several hours, protected from light. Filter, wash the precipitate and dry it at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of levodopa *(RS 201)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *microcrystalline cellulose* as the coating substance and a mixture of 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 50 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 ml of 1M *hydrochloric acid* and filter. Solution (2) contains 1% w/v of *levodopa BPCRS* in 1M *hydrochloric acid*. After removal of the plate, dry it in a current of warm air and spray with a freshly prepared mixture of equal volumes of a 10% w/v solution of *iron(III) chloride hexahydrate* and a 5% w/v solution of *potassium hexacyanoferrate(III)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Shake a quantity of the contents of the capsules containing 20 mg of Levodopa with 5 ml of 0.1M *hydrochloric acid*. Add 0.1 ml of *iron(III) chloride solution R1*; a green colour is produced. To half of the solution add an excess of 5M *ammonia*; a purple colour is produced. To the remainder of the solution add an excess of 5M *sodium hydroxide*; a red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium. For capsules containing 0.25 g of Levodopa or less, filter and dilute 2 ml of the filtrate to 10 ml with 0.1M *hydrochloric acid*. For capsules containing more than 0.25 g of Levodopa, filter and dilute 1 ml of the filtrate to 10 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the solution, Appendix II B, at 280 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of $C_9H_{11}NO_4$ in the medium taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm.

Specific optical rotation

–38.5 to –41.5, Appendix V F, when determined in the following manner. Shake a quantity of the contents of the capsules containing 1.25 g of Levodopa with 25 ml of 0.5M *hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid (Whatman No. 42 filter paper is suitable). To 10 ml of the filtrate add 10 ml of a 21.5% w/v solution of *aluminium sulphate*, 20 ml of a 21.8% w/v solution of *sodium acetate* and sufficient *water* to produce 50 ml and measure the *optical rotation*. Separately dilute 5 ml of the filtrate to 200 ml with 0.1M *hydrochloric acid*, mix well and dilute 10 ml to 200 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of levodopa, $C_9H_{11}NO_4$, in the filtrate taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm and hence calculate the *specific optical rotation*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a precoated cellulose plate (Merck plates are suitable) and a mixture of 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 50 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate, as bands 20 mm long, 10 µl of each of solutions (1) and (2) and 20 µl of solution (3) and dry in a current of air. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 ml of a mixture of equal volumes of *anhydrous formic acid* and *methanol*; prepare immediately before use. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) is a mixture of equal volumes of solution (1) and a solution prepared by dissolving 30 mg of L-*tyrosine* in 1 ml of *anhydrous formic acid* and diluting to 100 ml with *methanol*. After removal of the plate, dry it in a current of warm air, spray with a freshly prepared mixture of equal volumes of a 10% w/v solution of *iron(III) chloride hexahydrate* and a 5% w/v solution of *potassium hexacyanoferrate(III)* and examine the plate immediately. Any *secondary band* in the chromatogram obtained with solution (1) is not more intense than the band in the chromatogram obtained with solution (2) (0.5%). The test is not valid unless the chromatogram obtained with solution (3) shows a distinct band, at a higher Rf value than the principal band, which is more intense than the band in the chromatogram obtained with solution (2).

ASSAY

Dissolve as completely as possible a quantity of the mixed contents of 20 capsules containing 0.6 g of Levodopa in 10 ml of *anhydrous formic acid*, add 80 ml of *glacial acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *oracet blue B solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 19.72 mg of $C_9H_{11}NO_4$.

When L-dopa capsules are prescribed or demanded, Levodopa Capsules shall be dispensed or supplied.

Levodopa Tablets

General Notices

Action and use

Dopamine precursor; treatment of Parkinson's disease.

DEFINITION

Levodopa Tablets contain Levodopa.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levodopa, $C_9H_{11}NO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve as completely as possible a quantity of the powdered tablets containing 0.5 g of Levodopa in 25 ml of 1M *hydrochloric acid* and filter. Adjust to pH 3 with 5M *ammonia*, added dropwise with stirring, and allow to stand for several hours, protected from light. Filter, wash the precipitate with *water* and dry it at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of levodopa *(RS 201)*.

B. Comply with test B for Identification described under Levodopa Capsules, but using as solution (1) a solution obtained by shaking a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 ml of 1M *hydrochloric acid* and filtering.

C. Shake a quantity of the powdered tablets containing 20 mg of Levodopa with 5 ml of 0.1M *hydrochloric acid*. Add 0.1 ml of *iron*(III) *chloride solution R1*; a green colour is produced. To half of the solution add an excess of 5M *ammonia*; a purple colour is produced. To the remainder of the solution add an excess of 5M *sodium hydroxide*; a red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. For tablets containing 0.25 g of Levodopa or less, filter and dilute 2 ml of the filtrate to 10 ml with 0.1M *hydrochloric acid*. For tablets containing more than 0.25 g of Levodopa, filter and dilute 1 ml of the filtrate to 10 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the solution, Appendix II B, at 280 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of $C_9H_{11}NO_4$ in the medium taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm.

Specific optical rotation

–38.5 to –41.5, Appendix V F, when determined in the following manner. Shake a quantity of the finely powdered tablets containing 1.25 g of Levodopa with 25 ml of 0.5M *hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid (Whatman No. 42 filter paper is suitable). To 10 ml of the filtrate add 10 ml of a 21.5% w/v solution of *aluminium sulphate*, 20 ml of a 21.8% w/v solution of *sodium acetate* and sufficient *water* to produce 50 ml and measure the *optical rotation*. Further dilute 5 ml of the filtrate to 200 ml with 0.1M *hydrochloric acid*, mix well and dilute 10 ml to 200 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the concentration of levodopa, $C_9H_{11}NO_4$, in the filtrate taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm and hence calculate the *specific optical rotation*.

Related substances

Comply with the test described under Levodopa Capsules using as solution (1) a solution prepared immediately before use by shaking a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 ml of a mixture of equal volumes of *anhydrous formic acid* and *methanol*.

ASSAY

Weigh and powder 20 tablets. Dissolve as completely as possible a quantity of the powder containing 0.6 g of Levodopa in 10 ml of *anhydrous formic acid*, add 80 ml of *anhydrous acetic acid* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *oracet blue B solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 19.72 mg of $C_9H_{11}NO_4$.

When L-dopa tablets are prescribed or demanded, Levodopa Tablets shall be dispensed or supplied.

Levomenthol Cream

General Notices

Menthol in Aqueous Cream

NOTE: There are currently no licensed formulations in the United Kingdom.

DEFINITION

Levomenthol Cream contains Levomenthol in Aqueous Cream.

Extemporaneous preparation

Levomenthol Cream may be prepared using the following directions.

Triturate the Levomenthol to a *fine powder.* If necessary, a small amount of glycerol may be added to minimise the creation of airborne menthol dust. Add the Aqueous Cream gradually and mix until smooth.

The cream complies with the requirements stated under Topical Semi-solid Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of levomenthol, $C_{10}H_{20}O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to levomenthol in the chromatogram obtained with solution (3).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following freshly prepared solutions.

(1) 0.1% w/v of *camphor* (internal standard) in *industrial methylated spirit (95%)*.

(2) Disperse a quantity of the well-mixed cream containing 50 mg of Levomenthol in 20 ml of *industrial methylated spirit (95%)* and mix with the aid of ultrasound for 15 minutes. Transfer the liquid contents to a 50 ml graduated flask, rinse the original flask with two 10-ml quantities of *industrial methylated spirit (95%)*, transfer the washings to the graduated flask and add sufficient *industrial methylated spirit (95%)* to produce 50 ml; mix well and filter (Whatman No. 1 paper is suitable) discarding the first 5 ml of filtrate. Add 10 ml of solution (1) to 10 ml of the filtrate and add sufficient *industrial methylated spirit (95%)* to produce 25 ml; mix well.

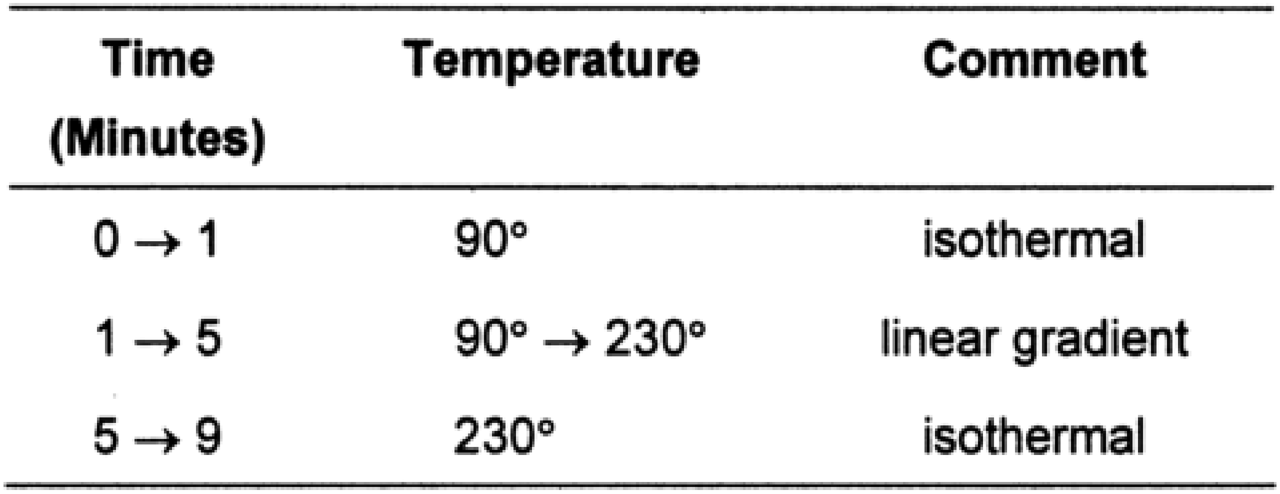
(3) Mix 5 ml of a 0.2% w/v solution of *levomenthol BPCRS* in *industrial methylated spirit (95%)* with 10 ml of solution (1) and dilute to 25 ml with *industrial methylated spirit (95%).*

CHROMATOGRAPHIC CONDITIONS

(a) Fused silica column (10 m × 0.53 mm) bonded with a 0.25-µm layer of dimethylpolysiloxane.

(b) Carrier gas Helium.

(c) Oven temperature:



Time (Minutes)	Temperature	Comment
0 → 1	90°	isothermal
1 → 5	90° → 230°	linear gradient
5 → 9	230°	isothermal

(d) Injector at 250°.

(e) Flame ionisation detector at 250°.

(f) Inject 1 µl of each solution.

When the chromatograms are recorded under the prescribed conditions the retention times are: levomenthol, about 2.1 minutes; camphor, about 2 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{20}O$ in the cream using the declared content of $C_{10}H_{20}O$ in *levomenthol BPCRS*.

Levomepromazine Injection

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Levomepromazine Injection is a solution of Levomepromazine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of levomepromazine hydrochloride, $C_{19}H_{24}N_2OS,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a volume of the injection containing 50 mg of Levomepromazine Hydrochloride add 2 ml of 1M *sodium hydroxide*, shake, extract with 15 ml of *ether* and allow to separate. Wash the ethereal layer with 5 ml of *water,* filter through phase-separating paper (Whatman 1 PS is suitable) containing *anhydrous sodium sulphate*, evaporate the ether to dryness and dry the residue at 100^{c} for 3 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of levomepromazine (*RS 404)*.

TESTS

Acidity

pH, 4.0 to 5.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using a *TLC silica gel GF*$_{254}$ *plate* and a mixture of 5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *toluene* as the mobile phase, maintained at 35°. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute a volume of the injection, if necessary, with sufficient of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to produce a solution containing 0.5% w/v of Levomepromazine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and further dilute 1 volume to 2 volumes with the same solvent mixture. Solution (3) contains 0.005% w/v of *levomepromazine sulphoxide BPCRS* in a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to levomepromazine sulphoxide is not more intense than the spot in the chromatogram obtained with solution (3) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Carry out the following procedure protected from light. Dilute a volume of the injection containing 0.1 g of Levomepromazine Hydrochloride to 100 ml with *water* and dilute 1 volume of this solution to 25 volumes with *water*. Immediately measure the *absorbance* of the solution at the maximum at 302 nm, Appendix II B, using *water* in the reference cell. Measure the absorbance of a 0.004% w/v solution of *levomepromazine maleate BPCRS* in *water* and calculate the content of $C_{19}H_{24}N_2OS,HCl$ from the absorbances obtained using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*. Each mg of $C_{19}H_{24}N_2OS,C_4H_4O_4$ is equivalent to 0.8207 mg of $C_{19}H_{24}N_2OS,HCl$.

STORAGE

Levomepromazine Injection should be protected from light.

LABELLING

The label states that coloured solutions must not be used.

Levomepromazine Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Levomepromazine Tablets contain Levomepromazine Maleate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levomepromazine maleate, $C_{19}H_{24}N_2OS,C_4H_4O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 50 mg of Levomepromazine Maleate add 10 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake, extract with 15 ml of *ether* and allow to separate. Wash the ethereal layer with 5 ml of *water*, filter through phase-separating paper (Whatman 1 PS is suitable) containing *anhydrous sodium sulphate*, evaporate the ether to dryness and dry the residue at 100° for 3 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of levomepromazine (*RS 404)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Macherey-Nagel plates are suitable) and a mixture of 3 volumes of *water*, 7 volumes of *anhydrous formic acid* and 90 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) mix a quantity of the powdered tablets containing 0.2 g of Levomepromazine Maleate with 10 ml of a mixture of 1 volume of *water* and 9 volumes of *acetone*, shake with the aid of ultrasound for 5 minutes, allow to stand and use the clear supernatant liquid. Solution (2) contains 0.6% w/v of *maleic acid* in *anhydrous formic acid*. After removal of the plate, allow it to dry at 120° for 10 minutes and examine under *ultraviolet light (254 nm)*. The chromatogram obtained with solution (1) shows a spot remaining on the line of application and a spot which is similar in position to the principal spot in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. After 30 minutes, withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, suitably diluted with 0.1M *hydrochloric acid*, if necessary, at 311 nm using 0.1M *hydrochloric acid* in the reference cell. Measure the *absorbance* of a 0.005% w/v solution of *levomepromazine maleate BPCRS* using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of levomepromazine maleate, $C_{19}H_{24}N_2OS,C_4H_4O_4$, in the medium from the absorbances obtained and using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*. The amount is not less than 60% of the stated amount.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using a *TLC silica gel GF_{254} plate* and a mixture of 5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) mix a quantity of the powdered tablets containing 0.1 g of Levomepromazine Maleate with 10 ml of a mixture of 1 volume of 18M *ammonia* and 99 volumes of *methanol*, shake with the aid of ultrasound for 5 minutes, mix, filter (Whatman No. 40 paper is suitable), discarding the first portion of filtrate, and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 50 mg of Levomepromazine Maleate add 15 ml of 0.2M *methanolic ammonia*, stir for 2 minutes, filter and collect the filtrate. Repeat the extraction with a further 3 successive 15-ml quantities of 0.2M *methanolic ammonia*, grinding the residue with a glass rod before extraction. Dilute the combined filtrates to 100 ml with 0.2M *methanolic ammonia*, mix and dilute 10 volumes of the solution to 100 volumes with *methanol* and further dilute 10 volumes of this solution to 100 volumes with the same solvent. Measure the *absorbance* of this solution at the maximum at 254 nm, Appendix II B, using *methanol* in the reference cell. Measure the *absorbance* of a 0.0005% w/v solution of *levomepromazine maleate BPCRS* in 0.002M *methanolic ammonia* at the same wavelength using *methanol* in the reference cell and calculate the content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in the tablets using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*.

STORAGE

Levomepromazine Tablets should be protected from light.

Levonorgestrel and Ethinylestradiol Tablets

General Notices

Action and use

Progestogen.

DEFINITION

Levonorgestrel and Ethinylestradiol Tablets contain Levonorgestrel and Ethinylestradiol.
The tablets comply with the requirements stated under Tablets and with the following requirements. For Levonorgestrel and Ethinylestradiol Tablets presented in 21-day or 28-day calendar packs, apply the requirements separately to tablets of each combination of different proportions, by weight, of the active ingredients. Where applicable, disregard any tablets that contain no active ingredient (placebo tablets).

Content of levonorgestrel, $C_{21}H_{28}O_2$

90.0 to 110.0% of the stated amount.

Content of ethinylestradiol, $C_{20}H_{24}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

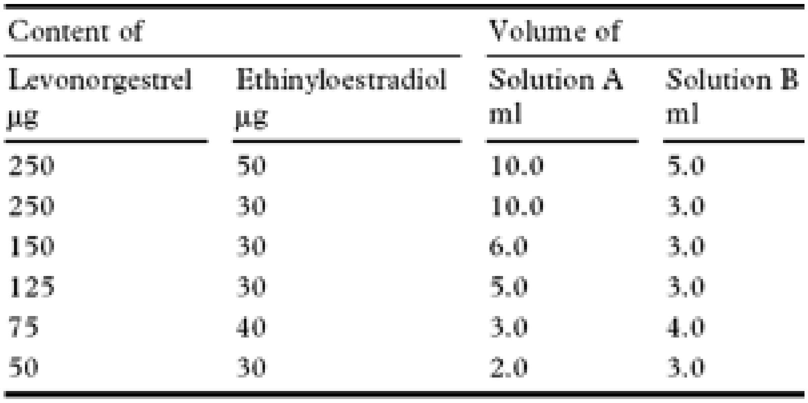
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 1 volume of *methanol* and 99 volumes of *chloroform* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) extract 15 powdered tablets with 30 ml of *acetone*, filter, evaporate to dryness and dissolve the residue in 1 ml of *chloroform*. Solution (2) contains 0.075% w/v of *levonorgestrel BPCRS* in *chloroform*. Solution (3) contains 0.045% w/v of *ethinylestradiol BPCRS* in *chloroform*. Develop the chromatograms twice, drying the plates between developments. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. One of the principal spots in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) and the other principal spot corresponds to that in the chromatogram obtained with solution (3). Spray the plate with a 2% w/v solution of *toluene-p-sulphonic acid* in *water* and heat at 105° for 10 minutes and examine under *ultraviolet light (365 nm)*. The spots corresponding to levonorgestrel and ethinylestradiol appear as blue spots.

Uniformity of content

Comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Prepare the following stock solutions using a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*. Solution A contains 0.0625% w/v of *levonorgestrel BPCRS.* Solution B contains 0.025% of *ethinylestradiol BPCRS*. Solution C contains 0.020% w/v of *2-hydroxybiphenyl* (internal standard). For solution D dilute 1 ml of solution C to 20 ml with the solvent mixture.

For solution (1) mix the volumes of solutions A and B specified in the table with 5 ml of solution C and dilute to 100 ml with a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*. For solution (2) add 4 ml of solution D to one tablet, and heat at 60° in an ultrasonic bath for 25 minutes, shake and repeat the ultrasound treatment. Cool, centrifuge and use the clear supernatant liquid.



Content of		Volume of	
Levonorgestrel µg	Ethinyloestradiol µg	Solution A ml	Solution B ml
250	50	10.0	5.0
250	30	10.0	3.0
150	30	6.0	3.0
125	30	5.0	3.0
75	40	3.0	4.0
50	30	2.0	3.0

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) a mixture of 49 volumes of *acetonitrile* and 51 volumes of *water* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 215 nm.

Calculate the content of $C_{21}H_{28}O_2$ and of $C_{20}H_{24}O_2$ in each tablet using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS* and the declared content of $C_{20}H_{24}O_2$ in *ethinylestradiol BPCRS*.

ASSAY

For both levonorgestrel and ethinylestradiol use the average of the 10 individual results obtained in the test for Uniformity of content.

Levonorgestrel Tablets

General Notices

Action and use

Progestogen.

DEFINITION

Levonorgestrel Tablets contain Levonorgestrel.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of levonorgestrel.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levonorgestrel, $C_{21}H_{28}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) to a quantity of the tablets containing 0.15 mg of Levonorgestrel add 25 ml of *methanol (80%)*, heat in a water bath at 60° for 10 minutes, shaking occasionally, allow to cool and filter through a membrane with a pore size of 0.45 µm. Solution (2) contains 0.0006% w/v of *levonorgestrel BPCRS* in *methanol (80%)*. Solution (3) contains 0.0012% w/v of *norgestrel BPCRS* in *methanol (80%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution containing equal volumes of *methanol* and 1% w/v of *gamma-cyclodextrin* in *water* and (c) a detection wavelength of 242 nm.

Inject 20 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to levonorgestrel and dextronorgestrel is at least 1.0.

A peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to levonorgestrel in the chromatogram obtained with solution (2).

B. In the test for uniformity of content, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of a mixture of equal volumes of *methanol* and *water* to a quantity of the powdered tablets containing 0.18 mg of Levonorgestrel, mix with the aid of ultrasound for 30 minutes, stir vigorously for 15 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *methanol* and *water*. Solution (3) contains 0.004% w/v each of *ethinylestradiol BPCRS* and *levonorgestrel BPCRS* in a mixture of equal volumes of *methanol* and *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable) and maintained at a temperature of 30^{c}, (b) as the mobile phase with a flow rate of 1.2 ml per minute a mixture of 100 volumes of *methanol*, 240 volumes of *acetonitrile* and 500 volumes of *water* and (c) a detection wavelength of 220 nm.

Inject separately 200 µl of each solution. For each solution allow the chromatography to proceed for twice the retention time of levonorgestrel.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ethinylestradiol and levonorgestrel is at least 12.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content

Tablets containing less than 2 mg of Levonorgestrel comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) to 1 tablet add 5 ml of the mobile phase, disperse with the aid of ultrasound for 45 minutes, shaking every 15 minutes, centrifuge and use the clear supernatant liquid. Solution (2) contains 0.0006% w/v of *levonorgestrel BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1.3 ml per minute a mixture of equal volumes of *acetonitrile* and *water* and (c) a detection wavelength of 220 nm.

Inject 25 µl of each solution.

Calculate the content of $C_{21}H_{28}O_2$ in each tablet using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for uniformity of content.

Levothyroxine Tablets

General Notices

Action and use

Thyroid hormone replacement.

DEFINITION

Levothyroxine Tablets contain Levothyroxine Sodium.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous levothyroxine sodium, $C_{15}H_{10}I_4NNaO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

B. To a quantity of the powdered tablets containing the equivalent of 0.5 mg of anhydrous levothyroxine sodium add a mixture of 3 ml of *ethanol (50%)* and 0.2 ml of *hydrochloric acid*, boil gently for 30 seconds, cool, filter, add 0.1 ml of a 10% w/v solution of *sodium nitrite* and boil; a yellow colour is produced. Cool and make alkaline with 5M *ammonia* ; the solution becomes orange.

Uniformity of content

Comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add sufficient 0.05M *sodium hydroxide* to one tablet to produce a solution containing the equivalent of about 6 µg per ml of anhydrous levothyroxine sodium, mix with the aid of ultrasound until the tablet is fully dispersed, cool and shake for 2 minutes. Add sufficient 0.05M *sodium hydroxide* to produce a solution containing the equivalent of 0.0004% w/v of anhydrous levothyroxine sodium, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0004% w/v of *levothyroxine sodium EPCRS* in 0.05M *sodium hydroxide*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Nucleosil 5 CN is suitable), (b) a mixture of 5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 225 nm. Inject 20 µl of each solution.

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in each tablet using the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D.

For tablets containing the equivalent of less than 50 µg of anhydrous levothyroxine sodium, use the following solutions. For solution (1) disperse with the aid of ultrasound for 10 minutes a quantity of the powdered tablets containing the equivalent of 50 µg of anhydrous levothyroxine sodium with 8 ml of a mixture of equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A). Shake for 2 minutes, cool, add sufficient solvent A to produce 10 ml, mix, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0005% w/v of *levothyroxine sodium EPCRS* in solvent A. Solution (3) contains 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS* in solvent A.

For tablets containing the equivalent of 50 µg of anhydrous levothyroxine sodium or more, use the following solutions. For solution (1) disperse with the aid of ultrasound for 10 minutes a quantity of the powdered tablets containing the equivalent of 0.1 mg of anhydrous levothyroxine sodium with 8 ml of a mixture of equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A). Shake for 2 minutes, cool, add sufficient solvent A to produce 10 ml, mix, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.001% w/v of *levothyroxine sodium EPCRS* in solvent A. Solution (3) contains 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS* in solvent A.

The chromatographic procedure may be carried out using the conditions described under the test for Uniformity of content.

The assay is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 4.

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in the tablets using peak areas and the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

STORAGE

Levothyroxine Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous levothyroxine sodium.

Lidocaine and Adrenaline Injection / Lidocaine and Epinephrine Injection

General Notices

Action and use

Local anaesthetic + class I antiarrhythmic; adrenoceptor agonist.

DEFINITION

Lidocaine and Adrenaline Injection is a sterile solution of Lidocaine Hydrochloride and Adrenaline Acid Tartrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$

95.0 to 105.0% of the stated amount.

Content of adrenaline, $C_9H_{13}NO_3$

87.5 to 112.5% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel G60 plates are suitable) and a mixture of 5 volumes of *methanol* and 95 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute a quantity of the injection, if necessary, with *water* to produce a solution containing 0.2% w/v of Lidocaine Hydrochloride. Solution (2) contains 0.2% w/v of *lidocaine hydrochloride BPCRS* in *water*. Solution (3) contains 0.2% w/v of *lidocaine hydrochloride BPCRS* and 0.2% w/v of *bupivacaine hydrochloride BPCRS* in *water*. After removal of the plate, dry it in a current of cold air, heat at 110^{c} for 1 hour, place the hot plate in a tank of chlorine gas prepared by the addition of *hydrochloric acid* to a 5% w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry the plate in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

B. In the Assay for adrenaline, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

Acidity

pH, 3.0 to 4.5, Appendix V L.

ASSAY

For lidocaine hydrochloride

Carry out the assay described under Lidocaine Injection.

For adrenaline

Prepare a solution by adding 8.0 g of *tetramethylammonium hydrogen sulphate*, 2.2 g of *sodium heptanesulphonate* and 2 ml of 0.1M *disodium edetate* to a mixture of 900 ml of *water* and 100 ml of *methanol*, adjust the pH to 3.5 using 1M *sodium hydroxide* and filter through glass microfibre paper under reduced pressure (solution A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 5 ml of a 0.001% w/v solution of *adrenaline acid tartrate BPCRS* to 10 ml with solution A. For solution (2) dilute the injection, if necessary, to contain 0.0005% w/v of adrenaline and dilute 5 ml of the resulting solution to 10 ml with solution A. For solution (3) mix 5 ml of solution (1) with 5 ml of a 0.001% w/v solution of *noradrenaline acid tartrate* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution prepared by adding 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate* and 2 ml of 0.1M *disodium edetate* to a mixture of 950 ml of *water* and 50 ml of *methanol* and adjusting the pH to 3.5 with 1M *sodium hydroxide* and (c) a detection wavelength of 205 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 2.0.

Calculate the content of $C_9H_{13}NO_3$ in the injection using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

STORAGE

Lidocaine and Adrenaline Injection should be protected from light.

LABELLING

The quantity of Adrenaline Acid Tartrate is stated in terms of the equivalent amount of adrenaline (epinephrine).

Lidocaine and Chlorhexidine Gel

General Notices

Action and use

Local anaesthetic; Class I antiarrhythmic and Antiseptic.

DEFINITION

Lidocaine and Chlorhexidine Gel is a sterile solution of Lidocaine Hydrochloride containing 0.25% v/v of Chlorhexidine Gluconate Solution in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$

95.0 to 105.0% of the stated amount.

Content of chlorhexidine gluconate solution

0.225 to 0.275% v/v.

IDENTIFICATION

To a quantity of the gel containing the equivalent of 80 mg of anhydrous lidocaine hydrochloride add 4 ml of *hydrochloric acid* and heat on a water bath for 10 minutes. Allow to cool, transfer to a separating funnel with the aid of 20 ml of *water*, add 5M *sodium hydroxide* until precipitation is complete and extract with two 20 ml quantities of *chloroform*. Filter the chloroform extracts through *anhydrous sodium sulphate* and evaporate the filtrate to dryness on a water bath using a current of nitrogen. The residue complies with tests A, B and C.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 202)*.

B. Dissolve 20 mg in 1 ml of *ethanol (96%)*, add 0.5 ml of a 10% w/v solution of *cobalt(II) chloride* and 0.5 ml of 5M *sodium hydroxide* and shake for 2 minutes. A bluish-green precipitate is produced.

C. Dissolve 40 mg in 5 ml of a 1% w/v solution of *cetrimide* and add 1 ml of 5M *sodium hydroxide* and 1 ml of *bromine water*. An orange colour is produced.

D. In the Assay for chlorhexidine gluconate solution, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to chlorhexidine acetate in the chromatogram obtained with solution (1).

TESTS

Aromatic amines

Not more than 8 ppm of 2,6-dimethyl-aniline and not more than 1.5 ppm of 4-chloro-aniline when determined in the following manner. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) shake 0.2 g of the gel with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of a buffer solution prepared by adjusting the pH of 0.1M *sodium citrate* to 5.0 with 0.2M *sodium hydroxide*, allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulphate* and filter through silica-treated filter paper (Whatman 1PS is suitable), add 100 µl of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 ml of 0.6M *sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer. For solution (2) dissolve 80 mg of *2,6-dimethylaniline* in 1 ml of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100 ml, dilute 1 volume of this solution to 50 volumes with 0.01M *hydrochloric acid* and further dilute 1 volume of this solution to 20 volumes with the same solvent. Shake 2 ml of this solution with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate …'. For solution (3) dissolve 30 mg of *4-chloroaniline* in 1 ml of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 ml and dilute 1 volume to 50 volumes with the same solvent and further dilute 1 volume to 20 volumes with the same solvent. Shake 2 ml of this solution with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate …'.

The chromatographic procedure may be carried out using (a) a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 15% w/w of cyanopropylmethylphenyl methyl silicone fluid (OV-225 is suitable) at a temperature of 190° with the inlet port at 200° and the detector at 270°, (b) *nitrogen* as the carrier gas at a flow rate of 50 ml per minute and (c) an electron capture detector.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) and the area of any peak corresponding to 4-chloroaniline is not greater than the area of the principal peak in the chromatogram obtained with solution (3).

Sterility

Complies with the *test for sterility*, Appendix XVI A.

ASSAY

For lidocaine hydrochloride

Carry out the Assay described under Lidocaine Gel .

For chlorhexidine gluconate solution

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of a 0.080% w/v solution of *diphenylamine* (internal standard) in the mobile phase to 5 ml of a 0.070% w/v solution of *chlorhexidine acetate BPCRS* in the mobile phase and dilute to 100 ml with the mobile phase. For solution (2) mix 10 g of the gel with sufficient of the mobile phase to produce 100 ml. Prepare solution (3) in the same manner as solution (2) but adding 5 ml of the internal standard solution before diluting to 100 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute

0.01 M *sodium octanesulphonate* in *methanol (73%)* adjusted to pH 3.0 with *glacial acetic acid* and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ from the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS*. Each mg of $C_{22}H_{30}Cl_2N_{10}$ is equivalent to 1.775 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$. Determine the *weight per ml* of the gel, Appendix V G, and express the result as the percentage volume in volume of Chlorhexidine Gluconate Solution, which contains 20% w/v of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

STORAGE

Lidocaine and Chlorhexidine Gel should be stored in accordance with the manufacturer's instructions.

LABELLING

The label states (1) the strength with respect to Lidocaine Hydrochloride in terms of the equivalent amount of anhydrous lidocaine hydrochloride; (2) that any of the gel not used in a single application should be discarded.

Lidocaine Gel

General Notices

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Lidocaine Gel is a sterile solution of Lidocaine Hydrochloride in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the gel containing the equivalent of 80 mg of anhydrous lidocaine hydrochloride add 4 ml of *hydrochloric acid* and heat on a water bath for 10 minutes. Allow to cool, transfer to a separating funnel with the aid of 20 ml of *water*, add 5M *sodium hydroxide* until precipitation is complete and extract with two 20 ml quantities of *chloroform*. Filter the chloroform extracts through *anhydrous sodium sulphate* and evaporate the filtrate to dryness on a water bath using a current of nitrogen. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 202)*.

B. Dissolve 20 mg in 1 ml of *ethanol (96%)*, add 0.5 ml of a 10% w/v solution of *cobalt(II) chloride* and 0.5 ml of 5M *sodium hydroxide* and shake for 2 minutes. A bluish-green precipitate is produced.

C. Dissolve 40 mg in 5 ml of a 1% w/v solution of *cetrimide* and add 1 ml of 5M *sodium hydroxide* and 1 ml of *bromine water*. A yellow colour is produced.

TESTS

2,6-Dimethylaniline

Mix a quantity of the gel containing the equivalent of 15 mg of anhydrous lidocaine hydrochloride with sufficient *water* to produce 3 ml using a rotary vortex mixer. To 2 ml of the resulting solution add 1 ml of a freshly prepared 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol*, mix thoroughly using a rotary vortex mixer, add 2 ml of *glacial acetic acid* and allow to stand for 10 minutes. The yellow colour produced is not more intense than that obtained using a mixture of 2 ml of a solution of *2,6-dimethylaniline* in *methanol* containing 2 µg per ml in place of the solution of the gel.

Sterility

Complies with the *test for sterility*, Appendix XVI A.

ASSAY

Disperse a quantity containing the equivalent of 10 mg of anhydrous lidocaine hydrochloride in 20 ml of *water*. Add 5 ml of *acetate buffer pH 2.8*, 120 ml of *chloroform* and 5 ml of *dimethyl yellow and oracet blue B solution* and titrate with 0.005M *dioctyl sodium sulphosuccinate VS*, swirling vigorously. Near the end point add the titrant dropwise and, after each addition, swirl vigorously, allow to separate and swirl gently for 5 seconds. The end point is indicated when the colour of the chloroform layer changes from green to pinkish-grey. Repeat the operation without the preparation being examined. The difference between the titrations represents the amount of dioctyl sodium sulphosuccinate required. Each ml of 0.005M *dioctyl sodium sulphosuccinate VS* is equivalent to 1.354 mg of $C_{14}H_{22}N_2O,HCl$. Determine the *weight per ml* of the gel, Appendix V G, and calculate the percentage of $C_{14}H_{22}N_2O,HCl$, weight in volume.

STORAGE

Lidocaine Gel should be stored in accordance with the manufacturer's instructions.

LABELLING

The label states (1) the strength in terms of the equivalent amount of anhydrous lidocaine hydrochloride; (2) that any of the gel not used in a single application should be discarded.

Lidocaine Injection

General Notices

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Lidocaine Injection is a sterile solution of Lidocaine Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Make a volume containing 0.1 g of Lidocaine Hydrochloride alkaline with 5M *sodium hydroxide*, filter, wash the residue with *water*, dissolve it in 1 ml of *ethanol (96%)*, add 0.5 ml of a 10% w/v solution of *cobalt*(II) *chloride* and shake for 2 minutes. A bluish-green precipitate is produced.

B. To a volume containing 0.1 g of Lidocaine Hydrochloride add 10 ml of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 229°, Appendix V A.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

2,6-Dimethylaniline

To a volume of the injection containing 25 mg of Lidocaine Hydrochloride add *water* if necessary to produce 10 ml, add 2M *sodium hydroxide* until the solution is just alkaline and extract with three 5 ml quantities of *chloroform*. Dry the combined chloroform extracts over *anhydrous sodium sulphate*, filter, wash with a further 5 ml of *chloroform* and evaporate the filtrate to dryness at a pressure of 2 kPa. Dissolve the residue in 2 ml of *methanol*, add 1 ml of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. Any yellow colour produced is not more intense than the colour obtained by repeating the operation using 10 ml of a solution of *2,6-dimethylaniline* in *water* containing 1 µg per ml in place of the injection (400 ppm).

ASSAY

Make a quantity containing 0.1 g of Lidocaine Hydrochloride alkaline with 2M *sodium hydroxide* and extract with three 20 ml quantities of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the washed extracts through a filter paper moistened with *chloroform* and wash the filter with 10 ml of *chloroform*. Add the washings to the filtrate and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each ml of 0.02M *perchloric acid VS* is equivalent to 5.776 mg of $C_{14}H_{22}N_2O,HCl,H_2O$.

Lidocaine Ointment

General Notices

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Lidocaine Ointment contains Lidocaine in a suitable hydrophilic basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of lidocaine, $C_{14}H_{22}N_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Warm a quantity of the ointment containing about 25 mg of Lidocaine until the basis has melted, add 1 ml of saturated *sodium chloride solution* and 0.2 ml of 1M *sodium hydroxide* and cool. Add 5 ml of *ether*, shake vigorously for 1 minute and allow the layers to separate. Filter the ether layer through *anhydrous sodium sulphate* and evaporate the *ether* to dryness. Dissolve the residue in the minimum volume of *chloroform IR*, apply the solution directly to a sodium chloride disc and allow the solvent to evaporate. The *infrared absorption spectrum* of the resulting thin film, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 405)*.

2,6-Dimethylaniline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a weighed quantity of the ointment containing 50 mg of Lidocaine in the mobile phase, dilute to 50 ml with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase. For solution (2) dilute a 0.1% w/v solution of *2,6-dimethylaniline* in *methanol* with the mobile phase to produce a solution containing 0.04 µg per ml of 2,6-dimethylaniline. For solution (3) mix equal volumes of a 0.01% w/v solution of *lidocaine BPCRS* in the mobile phase with a 0.005% w/v solution of *2,6-dimethylaniline* in the mobile phase.

The chromatographic procedure described under Assay may be used.

The chromatogram obtained with solution (3) shows a peak due to lidocaine and a peak due to 2,6-dimethylaniline with a retention time relative to lidocaine of about 0.5.

In the chromatogram obtained with solution (1), the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of the peak in the chromatogram obtained with solution (2) (400 ppm with reference to the content of Lidocaine).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For solution (1) dissolve a weighed quantity of the ointment containing 50 mg of Lidocaine in the mobile phase, dilute to 50 ml with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase. Solution (2) contains 0.010% w/v of *lidocaine BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Apex ODS 2 is suitable), (b) as the mobile phase with a flow rate of 0.8 ml per minute a mixture of 35 volumes of a phosphate buffer pH 8.0 prepared as described below and 65 volumes of *methanol* and (c) a detection wavelength of 230 nm. Prepare the phosphate buffer by adding a 0.408% w/v solution of *potassium dihydrogen orthophosphate* to a suitable volume of a 0.685% w/v solution of *dipotassium hydrogen orthophosphate* until pH 8.0 is attained.

Calculate the content of $C_{14}H_{22}N_2O$ in the ointment from the chromatograms obtained using the declared content of $C_{14}H_{22}N_2O$ in *lidocaine BPCRS*.

Lincomycin Capsules

General Notices

Action and use

Lincosamide antibacterial.

DEFINITION

Lincomycin Capsules contain Lincomycin Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lincomycin, $C_{18}H_{34}N_2O_6S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the capsules contents containing 0.2 g of Lincomycin Hydrochloride with 5 ml of a mixture of 4 volumes of *chloroform* and 1 volume of *methanol*, filter and evaporate the filtrate. Dissolve the oily residue in 1 ml of *water*, add *acetone* until precipitation begins and add a further 20 ml of *acetone*. Filter the precipitate, wash with two 10-ml quantities of *acetone*, dissolve the residue in a little of the chloroform–methanol mixture, evaporate to dryness and dry at 60° at a pressure not exceeding 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of lincomycin hydrochloride *(RS 203)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to the trimethylsilyl derivative of lincomycin in the chromatogram obtained with solution (1).

TESTS

Lincomycin B

Examine solution (3) as described under the Assay but increasing the sensitivity by 8 to 10 times while recording the peak derived from lincomycin B, which is eluted immediately before that derived from lincomycin. The area of the peak derived from lincomycin B, when corrected for the sensitivity factor, is not more than 5% of the area of the peak derived from lincomycin.

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 0.3 g.

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) add 10 ml of a 0.8% w/w solution of *dotriacontane* (internal standard) in *chloroform* to 0.1 g of *lincomycin hydrochloride EPCRS*, dilute to 100 ml with a 2% w/v solution of *imidazole* in *chloroform* and shake to dissolve. Place 4 ml of the resulting solution in a 15-ml ground-glass-stoppered centrifuge tube, add 1 ml of a mixture of 99 volumes of N,O-*bis(trimethylsilyl)acetamide* and 1 volume of *trimethylchlorosilane* and swirl gently. Loosen the glass stopper and heat at 65° for 30 minutes. Prepare solution (2) in the same manner as solution (1) but omitting the internal standard and using a quantity of the mixed contents of 20 capsules containing the equivalent of 90 mg of lincomycin in place of the *lincomycin hydrochloride EPCRS*. Prepare solution (3) in the same manner as solution (1) but using a quantity of the mixed contents of 20 capsules containing the equivalent of 90 mg of lincomycin in place of the *lincomycin hydrochloride EPCRS*.

The chromatographic procedure may be carried out using a glass column (1.5 m × 3 mm) packed with *acid-washed silanised diatomaceous support* impregnated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 260° with both the inlet port and the detector at 260° to 290° and using *helium* as the carrier gas with a flow rate of about 45 ml per minute.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of lincomycin.

Lincomycin Injection

General Notices

Action and use

Lincosamide antibacterial.

DEFINITION

Lincomycin Injection is a sterile solution of Lincomycin Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of lincomycin, $C_{18}H_{34}N_2O_6S$

92.5 to 107.5% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. Add *acetone* to a volume of the injection containing 0.2 g of Lincomycin Hydrochloride until precipitation begins and add a further 20 ml of *acetone*. Filter the precipitate, wash with two 10-ml quantities of *acetone*, dissolve the residue in the minimum of a mixture of 4 volumes of *chloroform* and 1 volume of *methanol*, evaporate to dryness and dry at 60° at a pressure not exceeding 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of lincomycin hydrochloride *(RS 203)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to the trimethylsilyl derivative of lincomycin in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L.

Lincomycin B

Examine solution (3) as described under the Assay but increase the sensitivity by 8 to 10 times while recording the peak derived from lincomycin B, which is eluted immediately before that derived from lincomycin. The area of the peak derived from lincomycin B, when corrected for the sensitivity factor, is not more than 5% of the area of the peak derived from lincomycin.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection if necessary with *water BET* to give a solution containing the equivalent of 10 mg of lincomycin per ml (solution A). The endotoxin limit concentration of solution A is 5.0 IU per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) add 10 ml of a 0.8% w/w solution of *dotriacontane* (internal standard) in *chloroform* to 0.1 g of *lincomycin hydrochloride EPCRS*, dilute to 100 ml with a 2% w/v solution of *imidazole* in *chloroform* and shake to dissolve. Place 4 ml of the resulting solution in a 15-ml ground-glass-stoppered centrifuge tube, add 1 ml of a mixture of 99 volumes of N*,O-bis(trimethylsilyl)acetamide* and 1 volume of *trimethylchlorosilane* and swirl gently. Loosen the glass stopper and heat at 65° for 30 minutes. Prepare solution (2) in the same manner as solution (1) but omitting the internal standard and using the residue obtained by evaporating to dryness 1 ml of a solution prepared by diluting a volume of the injection containing the equivalent of 0.9 g of lincomycin to 10 ml with *methanol* in place of the *lincomycin hydrochloride EPCRS*. Prepare solution (3) in the same manner as solution (1) but using the residue obtained by evaporating to dryness 1 ml of a solution prepared by diluting a volume of the injection containing the equivalent of 0.9 g of lincomycin to 10 ml with *methanol* in place of the *lincomycin hydrochloride EPCRS*.

The chromatographic procedure may be carried out using a glass column (1.5 m × 3 mm) packed with *acid-washed silanised diatomaceous support* impregnated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 260° with both the inlet port and the detector at 260° to 290° and using *helium* as the carrier gas with a flow rate of about 45 ml per minute.

STORAGE

Lincomycin Injection should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The strength is stated as the equivalent amount of lincomycin in a suitable dose-volume.

Liothyronine Tablets

General Notices

Action and use

Thyroid hormone replacement.

DEFINITION

Liothyronine Tablets contain Liothyronine Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of liothyronine sodium, $C_{15}H_{11}I_3NNaO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

TEST

Uniformity of content

Comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add sufficient 0.05M *sodium hydroxide* to one tablet to produce a solution containing about 6 µg per ml of Liothyronine Sodium, mix with the aid of ultrasound until the tablet is fully dispersed, cool and shake for 2 minutes. Add sufficient 0.05M *sodium hydroxide* to produce a solution containing 0.0004% w/v of Liothryonine Sodium, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0004% w/v of *liothyronine sodium EPCRS* in 0.05M *sodium hydroxide*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Nucleosil 5 CN is suitable), (b) a mixture of 5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 225 nm. Inject 20 µl of each solution.

Calculate the content of $C_{15}H_{11}I_3NNaO_4$ in each tablet using the declared content of $C_{15}H_{11}I_3NNaO_4$ in *liothyronine sodium EPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse with the aid of ultrasound for 10 minutes a quantity of the powdered tablets containing 0.1 mg of Liothyronine Sodium with 8 ml of a mixture of equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A). Shake for 2 minutes, cool, add sufficient solvent A to produce 10 ml, mix, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.001% w/v of *liothyronine sodium EPCRS* in solvent A. Solution (3) contains 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS* in solvent A.

The chromatographic procedure may be carried out using the conditions described under the test for Uniformity of content.

The assay is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 4.

Calculate the content of $C_{15}H_{11}I_3NNaO_4$ in the tablets using peak areas and the declared content of $C_{15}H_{11}I_3NNaO_4$ in *liothyronine sodium EPCRS*.

STORAGE

Liothyronine Tablets should be protected from light.

Lisinopril Tablets

General Notices

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Lisinopril Tablets contain Lisinopril Dihydrate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous lisinopril, $C_{21}H_{31}N_3O_5$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and as the mobile phase a mixture of equal volumes of *glacial acetic acid*, *butan-1-ol*, *ethyl acetate* and *water*. Pre-wash the plate with *methanol* and allow to dry in air before use. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 10 mg of anhydrous lisinopril with 2 ml of *water* and add 8 ml of *methanol*. Solution (2) contains 0.11% w/v of *lisinopril dihydrate BPCRS* in a mixture of 20 volumes of *water* and 80 volumes of *methanol*. After removal of the plate, allow it to dry in air, spray with a 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat at 105° for 10 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to lisinopril in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium after 30 minutes and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Use the filtered dissolution medium as solution (1). For solution (2) dissolve a quantity of *lisinopril dihydrate BPCRS* in sufficient of the dissolution medium to produce a solution of the same concentration as that expected for solution (1).

The chromatographic conditions described under Related substances may be used.

Calculate the total content of $C_{21}H_{31}N_3O_5$ in the medium from the chromatograms obtained and using the declared content of $C_{21}H_{31}N_3O_5$ in *lisinopril dihydrate BPCRS*. The amount of anhydrous lisinopril released is not less than 85% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 20 mg of anhydrous lisinopril with a mixture of 1 volume of *methanol* and 4 volumes of *water* (solvent A) with the aid of ultrasound for 5 minutes, dilute to 100 ml with solvent A, mix with the aid of ultrasound again for about 10 minutes ensuring that the temperature of the solution does not rise above room temperature, and filter through a 0.45-µm filter. Solution (2) contains 0.0003% w/v of *lisinopril diketopiperazine BPCRS* in solvent A. For solution (3) dilute 1 volume of solution (1) to 100 volumes with solvent A. Solution (4) contains 0.022% w/v of *lisinopril dihydrate BPCRS* and 0.0002% w/v of *lisinopril diketopiperazine BPCRS* in solvent A.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP-8 is suitable) maintained at 40°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution prepared by adding 200 volumes of *acetonitrile* to 800 volumes of a 0.408% w/v solution of *anhydrous potassium dihydrogen orthophosphate* adjusted to pH 2.0 with *orthophosphoric acid* containing 0.125% w/v of *sodium hexanesulphonate* and (c) a detection wavelength of 215 nm. Pass the mobile phase through the column for at least 30 minutes before starting the chromatography.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to lisinopril and lisinopril diketopiperazine is at least 5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to lisinopril diketopiperazine is not greater than the area of the peak in the chromatogram obtained with solution (2) (1.5%), the area of any other *secondary peak* is not greater than 0.3 times the area of the peak in the chromatogram obtained with solution (3) (0.3%) and the sum of the areas of any such peaks is not greater than 0.6 times the area of the peak in the chromatogram obtained with solution (3) (0.6%). The sum of the content of lisinopril diketopiperazine and the nominal total content of any other impurities is not more than 2%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake 10 whole tablets with a mixture of 1 volume of *methanol* and 4 volumes of *water* (solvent A) with the aid of ultrasound for 5 minutes, dilute to a suitable volume with solvent A, mix with the aid of ultrasound again for about 10 minutes ensuring that the temperature of the solution does not rise above room temperature, and filter through a 0.45-µm filter. Dilute a volume of the filtrate with solvent A to produce a solution containing the equivalent of 0.02% w/v of anhydrous lisinopril. Solution (2) contains 0.022% w/v of *lisinopril dihydrate BPCRS* in solvent A. Solution (3) contains 0.022% w/v of *lisinopril dihydrate BPCRS* and 0.0002% w/v of *lisinopril diketopiperazine BPCRS* in solvent A.

The chromatographic conditions described under Related substances may be used.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to lisinopril and lisinopril diketopiperazine is at least 5.

Calculate the content of $C_{21}H_{31}N_3O_5$ in the tablets from the chromatograms obtained and using the declared content of $C_{21}H_{31}N_3O_5$ in *lisinopril dihydrate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous lisinopril.

IMPURITIES

The impurities controlled by this monograph include lisinopril diketopiperazine.

Lithium Carbonate Tablets

General Notices

DEFINITION

Lithium Carbonate Tablets contain Lithium Carbonate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lithium carbonate, Li_2CO_3

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

ASSAY

Weigh and powder 20 tablets. Add a quantity of the powder containing 1 g of Lithium Carbonate to 100 ml of *water*, add 50 ml of 1M *hydrochloric acid VS* and boil for 1 minute to remove the carbon dioxide. Cool and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each ml of 1M *hydrochloric acid VS* is equivalent to 36.95 mg of Li_2CO_3.

Lithium Citrate Oral Solution

General Notices

DEFINITION

Lithium Citrate Oral Solution is a solution of Lithium Citrate in a suitable flavoured vehicle. *The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.*

Content of lithium citrate, $C_6H_5Li_3O_7,4H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The oral solution, when diluted with an equal volume of 3M *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

B. Boil 5 ml of the oral solution with 5 ml of *mercury(II) sulphate solution* and add a few drops of *dilute potassium permanganate solution*. The solution is decolorised and an off-white precipitate is produced.

TESTS

Acidity

pH, 4.0 to 5.5, Appendix V L.

ASSAY

Dilute a weighed quantity of the oral solution containing 0.4 g of Lithium Citrate to 1000 ml with *water* and add 0.05 ml of *polysorbate 80*. Determine the content of lithium by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 671 nm and using *lithium standard solution (100 ppm Li),* suitably diluted with *water* and 0.05 ml of *polysorbate 80*, to prepare the standard solutions. Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of lithium citrate, weight in volume, taking each mg of Li to be equivalent to 13.54 mg of $C_6H_5Li_3O_7,4H_2O$.

STORAGE

Lithium Citrate Oral Solution should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The quantity of the active ingredient in a suitable dose-volume is stated (1) as the amount of Lithium Citrate; (2) as the concentration of lithium ions in millimoles; (3) in terms of the equivalent amount of Lithium Carbonate.

Lofepramine Tablets

General Notices

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

LofepramineTablets contain Lofepramine Hydrochloride. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lofepramine, $C_{26}H_{27}ClN_2O$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Remove the majority of the coating. Wash the tablet with *dichloromethane* to remove the remaining coating. Place the tablet core in an ultrasound bath for 30 minutes with 10 ml of *dichloromethane*, filter the resulting suspension through a 0.45-µm PTFE filter; evaporate the filtrate to dryness using a rotary evaporator and a water bath at 30° and dry the residue at 50° at a pressure not exceeding 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of lofepramine hydrochloride (form B) *(RS 399B)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of tablets containing the equivalent of 0.35 g of lofepramine for 1 hour with 50 ml of a mixture of 250 volumes of *acetonitrile*, 250 volumes of *water* and 1 volume of *orthophosphoric acid (85%)*, dilute the resulting solution to 200 ml with the same solvent mixture, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the same solvent mixture. Solution (3) contains 0.0002% w/v each of *desimpramine hydrochloride EPCRS* and *imipramine hydrochloride EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Lichrospher 60 RP-select B is suitable) and maintained at 50°, (b) as the mobile phase with a flow rate of 1.5 ml per minute a 0.09% w/v solution of *sodium dodecyl sulphate* in a mixture of 550 volumes of *acetonitrile*, 325 volumes of *water* and 125 volumes of a buffer solution of pH 1.0 containing 0.015% w/v of *glycine*, 0.018% w/v of *sodium chloride* and 0.44% w/v of *hydrochloric acid* and (c) a detection wavelength of 254 nm.

Inject 20 µl of each solution. For solution (1) allow the chromatography to continue for 4 times the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 0.9.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any *secondary peaks* is not greater than twice the area of the peak in the chromatogram obtained with solution (2) (2%). Disregard any peak with a retention time of less than 3 minutes.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake 10 tablets for 1 hour with 300 ml of a mixture of 250 volumes of *acetonitrile*, 250 volumes of *water* and 1 volume of *orthophosphoric acid (85%)* and dilute to 500 ml with the same solvent mixture, mix and centrifuge; dilute the supernatant liquid with the same solvent mixture to produce a solution containing the equivalent of 0.028% w/v of lofepramine. Solution (2) contains 0.030% w/v of *lofepramine hydrochloride BPCRS* in the solvent mixture. Solution (3) contains 0.0002% w/v each of *desimpramine hydrochloride EPCRS* and *imipramine hydrochloride EPCRS* in the mobile phase.

The chromatographic procedure described under Related substances may be used.

Inject 20 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 0.9.

Calculate the content of $C_{26}H_{27}ClN_2O$ in the tablets using the declared content of $C_{26}H_{27}ClN_2O$ in *lofepramine hydrochloride BPCRS*.

STORAGE

Lofepramine Tablets should be protected from light and moisture.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of lofepramine.

Lomustine Capsules

General Notices

Action and use

Cytotoxic alkylating agent.

DEFINITION

Lomustine Capsules contain Lomustine.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lomustine, $C_9H_{16}ClN_3O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the following procedure in subdued light. Shake a quantity of the contents of the capsules containing 0.2 g of Lomustine with 10 ml of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator on a water bath maintained at not more than 60°. The residue, after drying at 60° at a pressure not exceeding 0.7 kPa for 30 minutes, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lomustine *(RS 204)*.

B. *Melting point*, about 88°, Appendix V A.

TEST

Related substances

A. Examine by *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 20 volumes of *glacial acetic acid* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.20 g of Lomustine with 10 ml of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 25 volumes with *methanol*. For solution (3) dilute 1 volume of solution (2) with 1 volume of *methanol*. For solution (4) dilute 1 volume of solution (2) to 10 volumes with *methanol*. For solution (5) dilute 1 volume of solution (2) to 20 volumes with *methanol*. For solution (6) dissolve 10 mg of *lomustine EPCRS* and 10 mg of *1,3-dicyclohexylurea* in *methanol* and dilute to 10 ml with the same solvent. After removal of the plate, dry it at 110° for 1 hour. At the bottom of a chromatography tank, place an evaporating dish containing a mixture of 1 volume of 7M *hydrochloric acid*, 1 volume of *water* and 2 volumes of a 1.5% w/v solution of *potassium permanganate*, close the tank and allow to stand for 15 minutes. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 5 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the line of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Spray with *potassium iodide and starch solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (0.4%) and at most one such spot is more intense than the spot in the chromatogram obtained with solution (5) (0.2%). The test is not valid unless the chromatogram obtained with solution (6) shows two clearly separated principal spots.

B. Examine by *liquid chromatography*, Appendix III D. For solution (1) shake a quantity of the contents of the capsules containing 0.20 g of Lomustine with 10 ml of *methanol* and filter. For solution (2) dilute 2 volumes of solution (2) to 100 volumes with *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 to 10 µm) (Nucleosil C18 is suitable), (b) as mobile phase with a flow rate of 2 ml per minute a mixture of 50 volumes of *methanol* and 50 volumes of *water*, (c) a detection wavelength of 230 nm and (d) a loop injector.

Inject 20 µl of solution (1). When the chromatograms are recorded in the prescribed conditions, the retention time of lomustine is about 25 minutes. When using a recorder, adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with solution (1) is not less than 50% of the full scale of the recorder.

Inject separately 20 µl of each solution. In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the following procedure in subdued light. Shake a quantity of the mixed contents of 20 capsules containing 40 mg of Lomustine with 70 ml of *ethanol (96%)* for 20 minutes, dilute to 100 ml with the same solvent and filter. Dilute 5 ml of the filtrate to 100 ml with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B. Calculate the content of $C_9H_{16}ClN_3O_2$ taking 260 as the value of A(1%, 1 cm) at the maximum at 230 nm.

Loperamide Capsules

General Notices

Action and use

Opioid receptor agonist; antidiarrhoeal.

DEFINITION

Loperamide Capsules contain Loperamide Hydrochloride.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of loperamide hydrochloride, $C_{29}H_{33}ClN_2O_2,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 2.5 volumes of *acetate buffer pH 4.7*, 17.5 volumes of *methanol*, 27 volumes of *ethyl acetate* and 53 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 10 mg of Loperamide Hydrochloride with 10 ml of *methanol* for 5 minutes and filter. Solution (2) contains 0.10% w/v of *loperamide hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Expose the plate to iodine vapour and examine again. By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of a buffer solution prepared by mixing 20 ml of 1M *acetic acid* with 60 ml of *water*, adjusting the pH to 4.7 with 1M *sodium hydroxide* and diluting to 100 ml with *water*, and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Use the filtered dissolution medium as solution (1). Solution (2) contains 0.00040% w/v of *loperamide hydrochloride BPCRS* in the dissolution medium.

The chromatographic procedure described under Assay may be used.

Calculate the total content of loperamide hydrochloride, $C_{29}H_{33}ClN_2O_2,HCl$, in the medium using the declared content of $C_{29}H_{33}ClN_2O_2,HCl$ in *loperamide hydrochloride BPCRS*.

Loperamide *N*-oxide

Carry out the method for *thin-layer chromatography*, Appendix III A, using a plate precoated with silica gel the surface of which has been modified with chemically-bonded octadecylsilyl groups (Whatman KC 18 plates are suitable) and a mixture of 30 volumes of *water*, adjusted to pH 3.0 by the addition of *orthophosphoric acid*, and 70 volumes of *methanol* as the mobile phase. Apply separately to the plate 25 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 20 mg of Loperamide Hydrochloride with 40 ml of *methanol* for 15 minutes, filter and evaporate the filtrate to dryness using a rotary evaporator and a water bath at 30°; to the residue add 2 ml of *methanol*, mix with the aid of ultrasound, centrifuge and use the supernatant liquid. Solution (2) contains 0.010% w/v of *loperamide* N*-oxide BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and expose to iodine vapour for 16 hours. In the chromatogram obtained with solution (1) any spot corresponding to loperamide *N*-oxide is not more intense than the principal spot in the chromatogram obtained with solution (2) (1%).

Uniformity of content

Capsules containing 2 mg of Loperamide Hydrochloride or less comply with the requirements stated under Capsules using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 150 ml of *water* to one whole capsule and mix with the aid of ultrasound for 30 minutes, shake mechanically for 30 minutes and dilute to 200 ml with *acetonitrile*, filter and use the filtrate. For solution (2) dissolve 10 mg of *loperamide hydrochloride BPCRS* in 45 ml of *water* and dilute to 100 ml with *acetonitrile*. Dilute 1 volume of the resulting solution to 10 volumes with the same solvent mixture.

The chromatographic procedure described under Assay may be used.

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in each capsule using the declared content of $C_{29}H_{33}ClN_2O_2$,HCl in *loperamide hydrochloride BPCRS*.

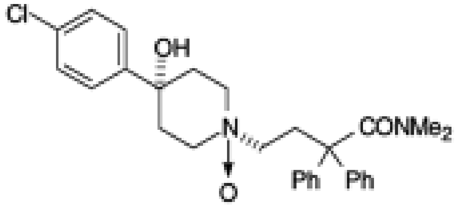
ASSAY

Prepare 0.005M *sodium octanesulphonate* containing, per 1000 ml, 1 ml of 13.5M *ammonia* and 0.5 ml of *triethylamine* and adjust the pH to 3.2 with *orthophosphoric acid* (solvent A). Carry out the method for *liquid chromatography* Appendix III D, using the following solutions. For solution (1) mix a quantity of the mixed contents of 20 capsules containing 20 mg of Loperamide Hydrochloride with 90 ml of *water* with the aid of ultrasound for 10 minutes, shake for 30 minutes, dilute to 200 ml with *acetonitrile* and filter. Solution (2) contains 0.010% w/v of *loperamide hydrochloride BPCRS* in a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile.*

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 45 volumes of solvent A and 55 volumes of *acetonitrile* and (c) a detection wavelength of 226 nm.

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in the capsules using the declared content of $C_{29}H_{33}ClN_2O_2$,HCl in *loperamide hydrochloride BPCRS*.

IMPURITIES



A. Loperamide *N*-oxide

Loprazolam Tablets

General Notices

Action and use

Benzodiazepine.

DEFINITION

Loprazolam Tablets contain Loprazolam Mesilate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of loprazolam, $C_{23}H_{21}ClN_6O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption,* Appendix II B, in the range 210 to 370 nm of the filtrate obtained in the Assay exhibits a maximum at 330 nm and a shoulder at 240 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 80 volumes of *chloroform* and 20 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 2 mg of loprazolam with 10 ml of a mixture of 46 volumes of *chloroform*, 46 volumes of *methanol* and 8 volumes of *water*, centrifuge and use the clear supernatant liquid. Solution (2) contains 0.02% w/v of *loprazolam mesilate BPCRS* in the same solvent mixture. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Complies with the test described under Loprazolam Mesilate, using 40 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 10 mg of loprazolam with 4 ml of a mixture of 46 volumes of *chloroform*, 46 volumes of *methanol* and 8 volumes of *water*, mix the suspension with the aid of ultrasound for 5 minutes, centrifuge and use the clear supernatant liquid. Solution (2) contains 0.00025% w/v of *loprazolam mesilate BPCRS* and solution (3) contains 0.00125% w/v of *6-(2-chlorophenyl)-2,4-dihydro-2-[(dimethylamino)methylene]-8-nitroimidazo-[1,2-a][1,4] benzodiazepin-1-one BPCRS* (dimethylamino analogue), both in the same solvent mixture. Any spot corresponding to the dimethylamino analogue in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content

Tablets containing less than the equivalent of 2 mg of loprazolam comply with the requirements stated under Tablets using the following method of analysis. Shake one tablet with 8 ml of *water*, add 80 ml of *absolute ethanol*, mix with the aid of ultrasound for 10 minutes, cool and dilute to 200 ml with *absolute ethanol*. Mix, filter, discarding the first 20 ml of filtrate, and measure the *absorbance* of the resulting solution at the maximum at 330 nm, Appendix II B. Calculate the content of $C_{23}H_{21}ClN_6O_3$ taking 890 as the value of A(1%, 1 cm) at the maximum at 330 nm.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of loprazolam.

Lorazepam Injection

General Notices

Action and use

Benzodiazepine.

DEFINITION

Lorazepam Injection is a sterile solution of Lorazepam in a suitable solvent.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add 5 ml of *hydrochloric acid* to a volume of the injection containing 10 mg of Lorazepam, heat in a water bath for 20 minutes and cool. Transfer the cooled solution to a separating funnel, add 8 ml of 10M *sodium hydroxide*, extract with two 25 ml quantities of *ether* and filter the combined extracts through absorbent cotton. Evaporate the filtrate to about 2 ml and dilute to 10 ml with *methanol*. For solution (2) add 5 ml of *hydrochloric acid* to 10 ml of a 0.1% w/v solution of *lorazepam BPCRS* in *absolute ethanol* and treat in the same manner as for solution (1) beginning at the words 'heat in a water bath…'. After removal of the plate, allow it to dry and spray with a freshly prepared 1.25% w/v solution of *sodium nitrite* in 0.5M *hydrochloric acid*. Heat the plate at 100° for 5 minutes, allow to cool and spray with a 0.1% w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride* in *absolute ethanol*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (1).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 100 volumes of *chloroform* and 10 volumes of *methanol* as the mobile phase. Before use, stand the plate in *methanol* and allow the solvent front to ascend 17 cm. Allow the plate to dry in air, heat it at 100° to 105° for 1 hour and use with the flow of mobile phase in the same direction as that used for the pretreatment. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) add 10 ml of *water* to a volume of the injection containing 4 mg of Lorazepam, extract with two 10 ml quantities of *dichloromethane*, wash the combined extracts with 10 ml of *water* and evaporate the washed extract to dryness at 20° in a current of nitrogen. Dissolve the residue in 2 ml of *acetone*. Solution (2) contains 0.010% w/v of *6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde BPCRS* in *acetone*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *acetone*. For solution (4) dilute 1 volume of solution (1) to 200 volumes with *acetone*. Solution (5) contains 0.1% v/v of *benzyl alcohol* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to 6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4). Disregard any spot with an Rf value similar to that of the spot in the chromatogram obtained with solution (5).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.008% w/v of *lorazepam BPCRS* in the mobile phase. For solution (2) dilute a suitable volume of the injection with sufficient mobile phase to produce a solution containing 0.008% w/v of Lorazepam.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) a mixture of 70 volumes of *methanol* and 30 volumes of *water* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ from the declared content of $C_{15}H_{10}Cl_2N_2O_2$ in *lorazepam BPCRS*.

STORAGE

Lorazepam Injection should be protected from light and stored at a temperature of 2° to 8°.

Lorazepam Tablets

General Notices

Action and use

Benzodiazepine.

DEFINITION

Lorazepam Tablets contain Lorazepam.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 350 nm of the solution obtained in the Assay exhibits two maxima, at 230 nm and 316 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Lorazepam with 10 ml of *acetone* for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 ml of *absolute ethanol*, add 5 ml of *hydrochloric acid*, heat on a water bath for 20 minutes and cool. Transfer the cooled solution to a separating funnel, add 8 ml of 10M *sodium hydroxide*, extract with two 25 ml quantities of *ether* and filter the combined extracts through absorbent cotton. Evaporate the filtrate to about 2 ml and dilute to 10 ml with *methanol*. For solution (2) treat 10 ml of a 0.1% w/v solution of *lorazepam BPCRS* in *absolute ethanol* in the same manner as described for solution (1) beginning at the words 'add 5 ml of *hydrochloric acid* …'. After removal of the plate, allow it to dry and spray with a freshly prepared 1.25% w/v solution of *sodium nitrite* in 0.5M *hydrochloric acid*. Heat the plate at 100° for 5 minutes, allow to cool and spray with a 0.1% w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride* in *absolute ethanol*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII D, using Apparatus 1. Use as the medium 900 ml of 0.1M *hydrochloric acid*, and rotate the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute, if necessary, a quantity of filtrate with 0.1M *hydrochloric acid* to produce a solution expected to contain about

0.00011% w/v of Lorazepam. Using 2 cm cells, measure the *absorbance* of the solution at the maximum at 232 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the content of Lorazepam, $C_{15}H_{10}Cl_2N_2O_2$, in the medium taking 1115 as the value of A(1%, 1cm) at the maximum at 232 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 10 volumes of *methanol* and 100 volumes of *chloroform* as the mobile phase. Before use, stand the plate in *methanol*, allowing the solvent front to ascend 17 cm, heat the plate at 100° to 105° for 1 hour. Use with the flow of mobile phase in the same direction as that used for the prewash. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) shake a quantity of powdered tablets containing 10 mg of Lorazepam with 4 ml of *acetone*, centrifuge and use the supernatant liquid. Solution (2) contains 0.0025% w/v of *6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde BPCRS* in *acetone*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *acetone*. For solution (4) dilute 1 volume of solution (1) to 200 volumes with *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to 6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4).

Uniformity of content

Tablets containing less than 2 mg of Lorazepam comply with the requirements stated under Tablets using the following method of analysis. Crush one tablet to a fine powder, add 40 ml of *ethanol (96%)* and shake for 1 hour. Add sufficient *ethanol (96%)* to produce 50 ml, centrifuge and dilute the supernatant liquid with sufficient *ethanol (96%)* to produce a solution containing 0.0005% w/v of Lorazepam. Measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B, and calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ taking 1150 as the value of A(1%, 1 cm) at the maximum at 230 nm.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 5 mg of Lorazepam add 40 ml of *ethanol (96%)* and shake for 1 hour. Add sufficient *ethanol (96%)* to produce 50 ml, centrifuge, dilute 5 ml to 100 ml with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B. Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ taking 1150 as the value of A(1%, 1 cm) at the maximum at 230 nm.

STORAGE

Lorazepam Tablets should be protected from light.

Lormetazepam Tablets

General Notices

Action and use

Benzodiazepine.

DEFINITION

Lormetazepam Tablets contain Lormetazepam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lormetazepam, $C_{16}H_{12}Cl_2N_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 10 mg of Lormetazepam with 5 ml of *acetone*, filter, wash the residue with a further 5 ml of *acetone*, combine the acetone extracts and evaporate to dryness on a water bath using a current of *nitrogen*. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of lormetazepam *(RS 207)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *chloroform* and 1 volume of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Lormetazepam with 5 ml of *acetone* for 15 minutes and filter. Solution (2) contains 0.2% w/v of *lormetazepam BPCRS* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the powdered tablets containing 10 mg of Lormetazepam in 100 ml of *methanol (60%),* centrifuge and use the clear supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol (60%)*. Solution (3) contains 0.0010% w/v each of *lormetazepam BPCRS* and *lorazepam BPCRS* in *methanol (60%)*.

The chromatographic procedure may be carried out using (a) a column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 48 volumes of *methanol* and 52 volumes of a phosphate buffer prepared by dissolving 4.91 g of *sodium dihydrogen orthophosphate* and 0.633 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml and (c) a detection wavelength of 230 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 4.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any *secondary peaks* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%). Disregard any peaks with a retention time of less than half that of lormetazepam.

Uniformity of content

Tablets containing less than 2 mg of Lormetazepam comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 3 ml of *water* to one tablet, allow to stand for 20 minutes with occasional shaking, mix with the aid of ultrasound for 2 minutes, add 35 ml of *methanol*, mix with the aid of ultrasound for 5 minutes, shake for a further 15 minutes and cool. For tablets containing 0.5 mg of Lormetazepam, dilute the resulting solution to 50 ml with *water* and for tablets containing 1 mg of Lormetazepam, dilute to 100 ml with *methanol (60%)*, centrifuge for 10 minutes and use the clear supernatant liquid. Solution (2) contains 0.001% w/v of *lormetazepam BPCRS* in *methanol (70%)*.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_{16}H_{12}Cl_2N_2O_2$ in each tablet using the declared content of $C_{16}H_{12}Cl_2N_2O_2$ in *lormetazepam BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the powdered tablets containing 10 mg of Lormetazepam in 500 ml of *methanol (60%)*, centrifuge for 15 minutes and use the clear supernatant liquid. Solution (2) contains 0.002% w/v of *lormetazepam BPCRS* in *methanol (60%)*.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_{16}H_{12}Cl_2N_2O_2$ in the tablets from the declared content of $C_{16}H_{12}Cl_2N_2O_2$ in *lormetazepam BPCRS*.

Lymecycline Capsules

General Notices

Action and use

Tetracycline antibacterial.

DEFINITION

Lymecycline Capsules contain Lymecycline.

The capsules comply with the requirements stated under Capsules and with the following requirements.

IDENTIFICATION

The contents of the capsules comply with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Adjust the pH of a 10% w/v solution of *disodium edetate* to 8.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 ml for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Before use, dry the plate in an oven at 110° for 1 hour. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 5 mg of Lymecycline with 10 ml of *methanol*, centrifuge and use the supernatant liquid. Solution (2) contains 0.05% w/v of *lymecycline BPCRS* in *methanol*. Solution (3) contains 0.05% w/v each of *tetracycline hydrochloride BPCRS*, *chlortetracycline hydrochloride BPCRS* and *doxycycline hyclate BPCRS* in *methanol*. After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to the principal spot in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

B. To 0.5 mg add 2 ml of *sulphuric acid*. A purplish red colour is produced.

C. Dissolve 50 mg in 5 ml of *water*, add 50 mg of *ninhydrin*, boil and add 15 ml of *water*. A bluish-violet colour is produced.

Dissolve 0.2 g in 5 ml of *water*, add 0.3 ml of *orthophosphoric acid* and distil. To 1 ml of the distillate add 10 ml of *chromotropic acid–sulphuric acid solution*. A violet colour is produced.

TESTS

Light-absorbing impurities

Dissolve the contents of five capsules as completely as possible in sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.15% w/v of Lymecycline and filter. The *absorbance* of the filtrate at 430 nm, when measured within 1 hour of preparing the solution, is not more than 0.60, calculated with reference to the anhydrous capsule contents, Appendix

II B.

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 0.3 g.

ASSAY

To a quantity of the mixed contents of 20 capsules containing 0.3 g of Lymecycline add 500 ml of 0.05M *hydrochloric acid*, mix and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of lymecycline in a capsule of average content weight taking each 1000 IU found to be equivalent to 1 mg of lymecycline. The upper fiducial limit of error is not less than 95.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

204 mg of Lymecycline is equivalent to approximately 150 mg of tetracycline.

Prolonged-release Lithium Carbonate Tablets

General Notices

Slow Lithium Carbonate Tablets

Prolonged-release Lithium Carbonate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Lithium Carbonate Tablets contain Lithium Carbonate and are formulated so as to release the medicament over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of lithium carbonate. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lithium carbonate, Li_2CO_3

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

ASSAY

Weigh and powder 20 tablets. Add a quantity of the powder containing 1 g of Lithium Carbonate to 100 ml of *water*, add 50 ml of 1M *hydrochloric acid VS* and boil for 1 minute to remove the carbon dioxide. Cool and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each ml of 1M *hydrochloric acid VS* is equivalent to 36.95 mg of Li_2CO_3.

Sterile Lidocaine Solution

General Notices

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Sterile Lidocaine Solution is a sterile *cutaneous solution*. It contains Lidocaine Hydrochloride in Purified Water.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Make a volume containing 0.1 g of Lidocaine Hydrochloride alkaline with 5M *sodium hydroxide,* filter, wash the residue with *water*, dissolve it in 1 ml of *ethanol (96%)*, add 0.5 ml of a 10% w/v solution of *cobalt(II) chloride* and shake for 2 minutes. A bluish-green precipitate is produced.

B. To a volume containing 0.1 g of Lidocaine Hydrochloride add 10 ml of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 229°, Appendix V A.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

2,6-Dimethylaniline

Dilute the solution to contain 0.25% w/v of Lidocaine Hydrochloride. To 10 ml of this solution add 2M *sodium hydroxide* until the solution is just alkaline and extract with three 5 ml quantities of *chloroform*, dry the combined chloroform extracts over *anhydrous sodium sulphate*, filter, wash with a further 5 ml of *chloroform* and evaporate the filtrate to dryness at a pressure of 2 kPa. Dissolve the residue in 2 ml of *methanol,* add 1 ml of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. Any yellow colour produced is not more intense than the colour obtained by repeating the operation using 10 ml of a solution of *2,6-dimethylaniline* in *water* containing 1 µg per ml in place of the solution being examined (400 ppm).

ASSAY

Make a quantity containing 0.1 g of Lidocaine Hydrochloride alkaline with 2M *sodium hydroxide* and extract with three 20 ml quantities of *chloroform*, washing each extract with the same 10 ml of *water*. Filter the washed extracts through a filter paper moistened with *chloroform* and wash the filter with 10 ml of *chloroform*. Add the washings to the filtrate and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each ml of 0.02M *perchloric acid VS* is equivalent to 5.776 mg of $C_{14}H_{22}N_2O,HCl,H_2O$.

Sterility

Complies with the *test for sterility*, Appendix XVI A.

LABELLING

The label states (1) that the solution is not intended for injection; (2) that the solution should be used on one occasion only and that any remainder should be discarded; (3) the date after which the solution is not intended to be used; (4) the conditions under which it should be stored.

The label indicates the pharmaceutical form as 'cutaneous solution'.

White Liniment

General Notices

White Embrocation

DEFINITION

White Liniment is a *cutaneous emulsion*.

Oleic Acid	85 ml
Turpentine Oil	250 ml
Dilute Ammonia Solution	45 ml
Ammonium Chloride	12.5 g
Purified Water	625 ml

Extemporaneous preparation

The following directions apply.

Mix the Oleic Acid with the Turpentine Oil. Dilute the Dilute Ammonia Solution with 45 ml of the Purified Water, previously warmed, add to the oily solution and shake to form an emulsion. Separately dissolve the Ammonium Chloride in the remainder of the Purified Water, add to the emulsion and mix.

The liniment complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of volatile oil

24.5 to 27.5% v/w.

Refractive index

Of the oily liquid obtained in the Assay, 1.465 to 1.477, Appendix V E.

ASSAY

Acidify 100 g with 1M *sulphuric acid* using *methyl orange solution* as indicator, distil in steam and collect the distillate in a separating funnel; occasionally separate the aqueous portion of the distillate and return it to the flask. When all the volatile matter has been distilled, remove the aqueous portion of the distillate and measure the volume of the oily liquid.

LABELLING

The label indicates the pharmaceutical form as 'cutaneous emulsion'.

Aromatic Magnesium Carbonate Mixture

General Notices

Aromatic Magnesium Carbonate Oral Suspension

DEFINITION

Aromatic Magnesium Carbonate Mixture is an *oral suspension* containing 3% w/v of Light Magnesium Carbonate and 5% w/v of Sodium Bicarbonate in a suitable vehicle containing Aromatic Cardamom Tincture.

Extemporaneous preparation

It is recently prepared according to the following formula.

Light Magnesium Carbonate	30 g
Sodium Bicarbonate	50 g
Aromatic Cardamom Tincture	30 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$

4.7 to 5.3% w/v.

Content of magnesium, Mg

0.70 to 0.86% w/v.

ASSAY

For sodium bicarbonate

Boil 10 g with 100 ml of *water* for 5 minutes, filter, boil the residue with 100 ml of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$. Determine the *weight per ml* of the mixture, Appendix V G, and calculate the percentage of $NaHCO_3$, weight in volume.

For magnesium

Dissolve 30 g in the minimum quantity of 2M *hydrochloric acid* and dilute to 200 ml with *water*.

To 20 ml of this solution add 200 ml of *water* and 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Use the *weight per ml* of the mixture to calculate the percentage of Mg, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Compound Magnesium Trisilicate Oral Powder

General Notices

DEFINITION

Magnesium Trisilicate	250 g
Chalk in powder	250 g
Sodium Bicarbonate	250 g
Heavy Magnesium Carbonate	250 g

The oral powder complies with the requirements stated under Oral Powders and with the following requirements.

Content of magnesium trisilicate, calculated as silica, SiO_2

11.0 to 15.2% w/w.

Content of sodium bicarbonate, $NaHCO_3$

23.7 to 26.9% w/w.

IDENTIFICATION

Shake 0.5 g with 5 ml of 2M *hydrochloric acid* and filter. The filtrate complies with the following tests.

A. To 0.05 ml add 0.2 ml of a 1% w/v solution of *glyoxal bis(2-hydroxyanil)* in *ethanol (96%)* and 0.05 ml of a 10% w/v solution of *sodium hydroxide*; a reddish brown precipitate is produced. Add *chloroform*; the precipitate dissolves to produce a red solution.

B. Add to the filtrate an excess of a 2.5% w/v solution of *ammonium oxalate*, filter and to the filtrate add 5M *sodium hydroxide* followed by *diphenylcarbazide solution*. A violet-red precipitate is produced.

ASSAY

For silica

Mix 1.5 g with 5 ml of *water* and 10 ml of 9M *perchloric acid* in a beaker, heat until dense white fumes are evolved, cover the beaker with a watch glass, continue heating for a further 3 hours and allow to cool. Add 30 ml of *water*, filter, wash the filter with 200 ml of hot *water*, discard the filtrate and washings, dry the filter paper and its contents, ignite at 1000°, cool and weigh. To the residue add 0.25 ml of *sulphuric acid* followed by 15 ml of *hydrofluoric acid*, heat cautiously on a sand bath until all the acid has evaporated, ignite at 1000°, cool and weigh. Subtract the weight of any residue so obtained from the weight of the residue obtained above and calculate the content of SiO_2 from the corrected weight of residue.

For sodium bicarbonate

Boil 2.5 g with 100 ml of *water* for 5 minutes, filter, boil the residue with 100 ml of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

Compound Magnesium Trisilicate Tablets

General Notices

Aluminium Hydroxide and Magnesium Trisilicate Tablets

DEFINITION

Compound Magnesium Trisilicate Tablets contain, in each, 250 mg of Magnesium Trisilicate and 120 mg of Dried Aluminium Hydroxide. They have a peppermint flavour.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aluminium, Al

28 to 40 mg.

Content of magnesium, Mg

30 to 41 mg.

TESTS

Disintegration

The requirement for Disintegration does not apply to Compound Magnesium Trisilicate Tablets.

Neutralising capacity

Weigh and powder 20 tablets. Pass the powder as completely as possible, regrinding if necessary, through a sieve of nominal mesh aperture about 75 µm and remix the sifted powder. Mix a quantity equivalent to two tablets with a small quantity of *water*, added slowly with stirring, to give a smooth paste and slowly add further quantities of *water*, with stirring, to a total volume of 100 ml. Warm to 37°, add 100 ml of 0.1M *hydrochloric acid VS* previously heated to 37° and stir continuously, using a suitable paddle stirrer at a rate of about 200 revolutions per minute, maintaining the temperature at 37°. The pH of the suspension at 37°, after 10, 15 and 20 minutes, is not less than 2.0, 2.4 and 2.7 respectively and at no time during this period is it more than 4.0. Add 10 ml of 0.5M *hydrochloric acid VS* previously heated to 37°, stir continuously for 1 hour maintaining the temperature at 37° and titrate with 0.1M *sodium hydroxide VS* to pH 3.5. Subtract the volume of 0.1M *sodium hydroxide VS* from 150 ml to obtain the number of ml of 0.1M *hydrochloric acid VS* required for the neutralisation. Not less than 50 ml of 0.1M *hydrochloric acid VS* is required to neutralise one tablet.

ASSAY

For aluminium

Weigh and powder 20 tablets. To a quantity of the powder equivalent to two tablets add 7 ml of *hydrochloric acid* and 7 ml of *water*, stir and heat on a water bath for 15 minutes, stirring occasionally. Add 30 ml of hot *water*, mix and filter whilst hot, washing the filter well with hot *water*. Cool the combined filtrate and washings and dilute to 100 ml with *water*. Reserve 25 ml for the Assay for magnesium. To 30 ml add 70 ml of *water* and 40 ml of 0.05M *disodium edetate VS*. Add 0.2 ml of *methyl red solution*, neutralise to the orange colour of the indicator with 1M *sodium hydroxide* and heat on a water bath for 30 minutes. Cool, add 3 g of *hexamine* and titrate the excess of disodium edetate with 0.05M *lead nitrate VS* using *xylenol orange solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.349 mg of Al.

For magnesium

To 25 ml of the solution reserved in the Assay for aluminium add 1 g of *ammonium chloride* and 10 ml, or a quantity sufficient to redissolve the precipitate that is produced, of *triethanolamine*. Add 150 ml of *water* and 5 ml of *ammonia buffer pH 10.9* and titrate immediately with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg.

LABELLING

The label states that the tablets should be chewed before being swallowed.

Magaldrate Oral Suspension

General Notices

Action and use

Antacid.

DEFINITION

Magaldrate Oral Suspension contains Magaldrate in a suitable flavoured vehicle.
The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous magaldrate, $Al_5Mg_{10}(OH)_{31}(SO_4)_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the oral suspension containing the equivalent of 0.8 g of anhydrous magaldrate in 20 ml of 3M *hydrochloric acid*, add 30 ml of *water* and heat to boiling. Add 6M *ammonia* until a pH of 6.2 is obtained, continue boiling for a further 2 minutes, filter and retain the precipitate and the filtrate. To 2 ml of the filtrate add 2 ml of *ammonium chloride solution* and neutralise with a solution prepared by dissolving 2 g of *ammonium carbonate* and 2 ml of 6M *ammonia* in sufficient *water* to produce 20 ml; no precipitate is produced. Add *disodium hydrogen phosphate solution*; a white, crystalline precipitate is produced which is insoluble in 6M *ammonia*.

B. The precipitate retained in test A yields the reaction characteristic of *aluminium salts*, Appendix VI.

C. The filtrate obtained in test A yields the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Neutralising capacity

Disperse a quantity containing the equivalent of 0.8 g of anhydrous magaldrate in 70 ml of water, heat to 37° and mix for 1 minute. Maintain the temperature at 37° and, while stirring continuously, add from a pipette 30 ml of 1M *hydrochloric acid VS*. Stir for 15 minutes and, over a period not exceeding 5 minutes, titrate the excess acid with 1M *sodium hydroxide VS* to a pH of 3.5 which is stable for a period of 10 to 15 seconds. Not more than 12 ml of 1M *sodium hydroxide VS* is required.

Magnesium hydroxide

Not less than 49.2% and not more than 66.6% of the content of anhydrous magaldrate when determined by the following method. Mix a quantity of the oral suspension containing the equivalent of 1 g of magaldrate in 30 ml of 2M *hydrochloric acid* and add sufficient *water* to produce 100 ml (solution A). Dilute 10 ml of this solution to 200 ml with *water*. Add, while stirring, 1 g of *ammonium chloride*, 20 ml of *triethanolamine*, 10 ml of *ammonia buffer pH 10.9* and 0.4 ml of *mordant black 11 solution*. Titrate with 0.05M *disodium edetate VS* until a blue colour is obtained. Repeat the procedure without the substance being examined. The difference between the titrations represents the amount of disodium edetate required. Each ml of 0.05M *disodium edetate VS* is equivalent to 2.916 g of $Mg(OH)_2$.

Aluminium hydroxide

Not less than 32.1% and not more than 45.9% of the stated content of anhydrous magaldrate when determined by the following method. Dilute 10 ml of solution A obtained in the test for Magnesium hydroxide with 20 ml of *water*. Add 25 ml of 0.05M *disodium edetate VS*, mix, allow to stand for 5 minutes and add 20 ml of *acetate buffer pH 4.4*, 60 ml of *ethanol (96%)* and 2 ml of a 0.026% w/v solution of *dithizone* in *ethanol (96%)*. Titrate with 0.05M *zinc sulphate VS* until a bright pink colour is obtained. Repeat the procedure without the substance being examined. The difference between the titrations represents the amount of disodium edetate required. Each ml of 0.05M *disodium edetate VS* is equivalent to 3.90 g of $Al(OH)_3$.

Microbial contamination

Carry out a quantitative evaluation for Enterobacteria and certain other Gram-negative bacteria, Appendix XVI B1. 0.01 ml of the preparation gives a negative result, Table 1 (most probable number of bacteria per gram fewer than 10^2).

ASSAY

To a quantity of the oral suspension containing the equivalent of 3 g of anhydrous magaldrate add 100 ml of 1M *hydrochloric acid VS* and mix using a magnetic stirrer to achieve dissolution. Titrate the excess acid with 1M *sodium hydroxide VS* to pH 3, determined potentiometrically. Repeat the procedure without the preparation being examined. The difference between the titrations represents the amount of hydrochloric acid required. Each ml of 1M *hydrochloric acid VS* is equivalent to 35.40 mg of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

LABELLING

The quantity of the active ingredient is stated in terms of the equivalent amount of anhydrous magaldrate.

Magnesium Chloride Injection

General Notices

DEFINITION

Magnesium Chloride Injection is a sterile solution of Magnesium Chloride Hexahydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of magnesium chloride hexahydrate, $MgCl_2,6H_2O$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

Yields the reactions characteristic of *magnesium salts* and of *chlorides*, Appendix VI.

Acidity or alkalinity

pH, 5.0 to 8.0, Appendix V L.

ASSAY

Dilute a volume containing 2.5 g of Magnesium Chloride Hexahydrate to 100 ml with *water*. To 20 ml of this solution add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.1M *disodium edetate VS* using 0.1 g of *mordant black 11 triturate* as indicator, until the pink tint is discharged from the blue colour. Each ml of 0.1M *disodium edetate VS* is equivalent to 20.33 mg of $MgCl_2,6H_2O$.

LABELLING

The strength is stated as the percentage w/v of Magnesium Chloride Hexahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in millimoles per ml.

For a preparation containing 10% w/v of Magnesium Chloride Hexahydrate, the concentration of magnesium ions is approximately 0.5 millimoles per millilitre (0.5 mmol Mg^{2+}/ml).

Magnesium Hydroxide Mixture

General Notices

Magnesium Hydroxide Oral Suspension

DEFINITION

Magnesium Hydroxide Mixture is an aqueous *oral suspension* of hydrated magnesium oxide. It may be prepared from a suitable grade of Light Magnesium Oxide.

Extemporaneous preparation

The following formula and directions apply.

Magnesium Sulphate	47.5 g
Sodium Hydroxide	15 g
Light Magnesium Oxide	52.5 g
Chloroform	2.5 ml
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 ml

Dissolve the Sodium Hydroxide in 150 ml of Purified Water, add the Light Magnesium Oxide, mix to form a smooth cream and then add sufficient Purified Water to produce 2500 ml. Pour this suspension in a thin stream into a solution of the Magnesium Sulphate in 2500 ml of Purified Water, stirring continuously during the mixing. Allow the precipitate to subside, remove the clear liquid, transfer the residue to a calico strainer, allow to drain and wash the precipitate with Purified Water until the washings give only a slight reaction for *sulphates*, Appendix VI. Mix the washed precipitate with Purified Water, dissolve the Chloroform in the mixture and add sufficient Purified Water to produce 1000 ml.

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of hydrated magnesium oxide, calculated as $Mg(OH)_2$

7.45 to 8.35% w/w.

CHARACTERISTICS

A white, uniform suspension which does not separate readily on standing.

TESTS

Heavy metals

Dissolve 12.5 g in 10 ml of *hydrochloric acid* and 20 ml of *water*, add 0.5 ml of *nitric acid*, boil to remove any carbon dioxide and filter. To the cooled filtrate add 2 g of *ammonium chloride* and 2 g of *ammonium thiocyanate* and extract with two successive 10 ml quantities of a mixture of equal volumes of *isoamyl alcohol* and *ether*. To the aqueous layer add 2 g of *citric acid* and sufficient *water* to produce 50 ml. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (1 ppm Pb)* to prepare the standard (4 ppm).

Sulphate

Dissolve 2.5 ml in 20 ml of *hydrochloric acid* and dilute to 500 ml with *water*. 15 ml of the solution, filtered if necessary, complies with the *limit test for sulphates*, Appendix VII (0.2%).

ASSAY

Mix 10 g with 50 ml of *water*, add 50 ml of 0.5M *sulphuric acid VS* and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each ml of 0.5M *sulphuric acid VS* is equivalent to 29.16 mg of hydrated magnesium oxide calculated as $Mg(OH)_2$.

STORAGE

Magnesium Hydroxide Mixture should not be kept in a cold place.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Magnesium Sulphate Injection

General Notices

DEFINITION

Magnesium Sulphate Injection is a sterile solution of Magnesium Sulphate Heptahydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of magnesium sulphate heptahydrate, $MgSO_4,7H_2O$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

Yields the reactions characteristic of *magnesium salts* and of *sulphates*, Appendix VI.

TESTS

Acidity or alkalinity

pH of the injection diluted, if necessary, to contain 5% w/v of Magnesium Sulphate Heptahydrate, 5.5 to 7.0, Appendix V L.

ASSAY

Dilute a volume containing 1.25 g of Magnesium Sulphate Heptahydrate to 100 ml with *water*. To 20 ml of this solution add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using 0.1 g of *mordant black 11 triturate* as indicator, until the pink tint is discharged from the blue colour. Each ml of 0.05M *disodium edetate VS* is equivalent to 12.32 mg of $MgSO_4,7H_2O$.

LABELLING

The strength is stated as the percentage w/v of Magnesium Sulphate Heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in millimoles per ml.

For a preparation containing 50% w/v of Magnesium Sulphate Heptahydrate ($MgSO_4,7H_2O$) the concentration of magnesium ions is approximately 2 millimoles per millilitre (2 mmol Mg^{2+}/ml).

Magnesium Sulphate Mixture

General Notices

Magnesium Sulphate Oral Suspension

DEFINITION

Magnesium Sulphate Mixture is an *oral suspension* containing 40% w/v of Magnesium Sulphate Heptahydrate and 5% w/v of Light Magnesium Carbonate in a suitable vehicle with a peppermint flavour.

Extemporaneous preparation

It is recently prepared according to the following formula.

Magnesium Sulphate Heptahydrate	400 g
Light Magnesium Carbonate	50 g
Concentrated Peppermint Emulsion	25 ml
Double-strength Chloroform Water	300 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium sulphate heptahydrate, $MgSO_4,7H_2O$

36.0 to 44.0% w/v.

Content of magnesium carbonate, calculated as Mg

1.14 to 1.49% w/v.

IDENTIFICATION

A. Filter 10 ml of the mixture and reserve the residue. The filtrate yields reaction A characteristic of *magnesium salts*, Appendix VI. Wash the residue with 10 ml of *water*, dissolve 25 mg in 1 ml of 1M *hydrochloric acid* and adjust the pH to 6 to 7 with 1M *sodium hydroxide*. The resulting solution yields reaction A characteristic of *magnesium salts*, Appendix VI.

B. The residue obtained in test A yields reaction A characteristic of *carbonates*, Appendix VI.

C. The filtrate obtained in test A yields reaction A characteristic of *sulphates*, Appendix VI.

ASSAY

For magnesium sulphate heptahydrate

Boil 0.7 g with 50 ml of a mixture of equal volumes of *ethanol (96%)* and *water*, cool, filter and wash the residue with successive small quantities of the diluted ethanol until the washings are free from sulphate. Reserve the residue for the Assay for magnesium carbonate. To the combined filtrate and washings add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 12.32 mg of $MgSO_4,7H_2O$. Determine the *weight per ml* of the mixture, Appendix V G, and calculate the percentage of $MgSO_4,7H_2O$, weight in volume.

For magnesium carbonate

Dissolve the residue obtained in the Assay for magnesium sulphate in 10 ml of 1M *hydrochloric acid* and wash the filter with successive small quantities of *water* until the washings are free from chloride. To the combined filtrate and washings add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Using the *weight per ml*, calculate the percentage of Mg, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Magnesium Sulphate Paste

General Notices

Morison's Paste

DEFINITION

Dried Magnesium Sulphate	A sufficient quantity
Phenol	0.5 g
Glycerol, previously heated at 120°	55 g
for 1 hour and cooled	

Extemporaneous preparation

The following directions apply.

Dry about 70 g of Dried Magnesium Sulphate at 150° for 1.5 hours or at 130° for 4 hours and allow to cool in a desiccator. Mix 45 g of the dried material in a warm mortar with the Phenol dissolved in the Glycerol.

In preparing larger quantities of the paste the period of heating the Dried Magnesium Sulphate should be increased, if necessary, to ensure that the dried material contains not less than 85% of magnesium sulphate, calculated as $MgSO_4$.

The paste complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of magnesium sulphate, $MgSO_4$

36.0 to 41.0% w/w.

Content of phenol, C_6H_6O

0.45 to 0.55% w/w.

ASSAY

For magnesium sulphate

Dissolve 5 g in sufficient *water* to produce 100 ml. To 10 ml of the resulting solution add 150 ml of *water* and 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS*, using *mordant black 11 solution* as indicator, to a full blue colour. Each ml of 0.05M *disodium edetate VS* is equivalent to 6.018 mg of $MgSO_4$.

For phenol

Dissolve 5 g in 25 ml of *water*, add 25 ml of 0.05M *bromine VS* and 5 ml of *hydrochloric acid*, stopper the flask, allow to stand for 30 minutes with occasional swirling and then allow to stand for a further 15 minutes. Add 5 ml of a 20% w/v solution of *potassium iodide*, shake thoroughly, titrate with 0.1M *sodium thiosulphate VS* until only a faint yellow colour remains, add 0.25 ml of *starch mucilage* and 10 ml of *chloroform* and complete the titration with vigorous shaking. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O.

LABELLING

The label states that the Paste should be stirred before use.

Magnesium Trisilicate Mixture

General Notices

Magnesium Trisilicate Oral Suspension; Compound Magnesium Trisilicate Mixture

DEFINITION

Magnesium Trisilicate Mixture is an *oral suspension* containing 5% w/v each of Magnesium Trisilicate, Light Magnesium Carbonate and Sodium Bicarbonate in a suitable vehicle with a peppermint flavour.

Extemporaneous preparation

It is recently prepared according to the following formula.

Magnesium Trisilicate	50 g
Light Magnesium Carbonate	50 g
Sodium Bicarbonate	50 g
Concentrated Peppermint Emulsion	25 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium, Mg

1.70 to 2.20% w/v.

Content of sodium bicarbonate, $NaHCO_3$

4.60 to 5.40% w/v.

IDENTIFICATION

A. Filter 50 ml of the mixture using a Buchner funnel, reserving the filtrate, wash the filter with 50 ml of *water* and dry the residue at 100° to 105° for 1 hour. The filtrate yields reaction B characteristic of *sodium salts* and reaction A characteristic of *bicarbonates*, Appendix VI.

B. Shake 0.5 g of the residue obtained in test A with 5 ml of 1M *hydrochloric acid* for 5 minutes, add 5 ml of 1M *sodium hydroxide* and centrifuge. The supernatant liquid yields reaction B characteristic of *magnesium salts*, Appendix VI.

C. The residue obtained in test A yields reaction A characteristic of *carbonates*, Appendix VI.

D. 30 mg of the residue obtained in test A yields the reaction characteristic of *silicates*, Appendix VI.

Neutralising capacity

To 5 g add 100 ml of *water* and heat to 37°c. Add 100 ml of 0.1M *hydrochloric acid VS* previously heated to 37°c and stir continuously using a suitable paddle stirrer rotating at a rate of about 200 revolutions per minute, maintaining the temperature at 37°c. The pH of the suspension at 37°c after 10 and 20 minutes is not less than 2.0 and not less than 2.4 respectively and at no time is it more than 4.0. Add 10 ml of 0.5M *hydrochloric acid VS* previously heated to 37°c, stir continuously for 1 hour, maintaining the temperature at 37°c, and titrate with 0.1M *sodium hydroxide VS* to pH 3.5. Subtract the volume of 0.1M *sodium hydroxide VS* from 150 to obtain the number of ml of 0.1M *hydrochloric acid VS* required for the neutralisation. Determine the *weight per ml* of the mixture, Appendix V G, and hence the volume of 0.1M *hydrochloric acid VS* required to neutralise 5 ml of the mixture. Not less than 100 ml of 0.1M *hydrochloric acid VS* is required.

ASSAY

For magnesium

To 5 g add 7 ml of *hydrochloric acid* and 7 ml of *water*, stir and heat on a water bath for 15 minutes. Add 30 ml of hot *water*, mix, filter while still hot and wash the filter with hot *water*. Cool the combined filtrate and washings and dilute to 100 ml with *water*. To 25 ml of the resulting solution add 150 ml of *water* and 5 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each ml of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Using the weight per ml of the mixture calculate the percentage of Mg, weight in volume.

For sodium

bicarbonate Boil 20 g with 100 ml of *water* for 5 minutes, filter, boil the residue with 100 ml of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 ml of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$. Using the weight per ml of the mixture calculate the percentage of $NaHCO_3$, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral suspension'.

Mannitol Intravenous Infusion

General Notices

DEFINITION

Mannitol Intravenous Infusion is a sterile solution of Mannitol in Water for Injections.
The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of mannitol, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. Evaporate to dryness on a water bath a volume containing 0.2 g of Mannitol. The *melting point* of the residue, Appendix V A, is about 167°.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *water,* 70 volumes of *propan-1-ol* and 20 volumes of *ethyl acetate* as the mobile phase but allowing the solvent front to ascend 17 cm above the line of application. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) dilute a volume of the intravenous infusion with *water* to contain 0.25% w/v of Mannitol. Solution (2) contains 0.25% w/v of *mannitol EPCRS* in *water*. After removal of the plate, allow it to dry in air and spray with a 0.2% w/v solution of *sodium periodate*. Allow the plate to dry in air for 15 minutes and spray with a 2% w/v solution of *4,4´-methylenebis-*N,N*-dimethylaniline* in a mixture of 1 volume of *glacial acetic acid* and 4 volumes of *acetone*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

C. Add 0.3 ml of a solution containing 10% w/v of Mannitol to 3 ml of a cooled mixture prepared by adding 6 ml of *sulphuric acid* to 3 ml of a freshly prepared 10% w/v solution of *catechol* while cooling in ice. Heat gently over a naked flame for about 30 seconds. A pink colour develops.

TESTS

Acidity or alkalinity

pH, 4.5 to 7.0, Appendix V L, when determined on solutions diluted, if necessary, with *water for injections* to contain 10% w/v of Mannitol and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

Reducing sugars

Add 20 ml of *cupri-citric solution* and a few glass beads to a volume of the intravenous infusion containing 5 g of Mannitol. Heat so that boiling begins after 4 minutes and continue boiling for 3 minutes. Cool rapidly and add 100 ml of a 2.4% v/v solution of *glacial acetic acid* and 20 ml of 0.025M *iodine VS*. With continuous shaking add 25 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and, when the precipitate has dissolved, titrate the excess of iodine with 0.05M *sodium thiosulphate VS* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05M *sodium thiosulphate VS* is required.

Bacterial endotoxins

The endotoxin limit concentration is 0.5 IU per ml, Appendix XIV C. Dilute infusions containing more than 10% w/v (100 g/l) of Mannitol with *water BET* to contain 10% w/v.

ASSAY

Dilute a quantity containing 0.4 g of Mannitol to 100 ml with *water*, transfer 10 ml to a stoppered flask, add 20 ml of 0.1M *sodium periodate* and 2 ml of 1M *sulphuric acid* and heat on a water bath for 15 minutes. Cool, add 3 g of *sodium hydrogen carbonate* and 25 ml of 0.1M *sodium arsenite VS*, mix, add 5 ml of a 20% w/v solution of *potassium iodide*, allow to stand for 15 minutes and titrate with 0.05M *iodine VS* until the first trace of yellow colour appears. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of iodine required. Each ml of 0.05M *iodine VS* is equivalent to 1.822 mg of $C_6H_{12}O_6$.

STORAGE

Mannitol Intravenous Infusion should be stored at a temperature of 20° to 30°. Exposure to lower temperatures may cause the deposition of crystals, which should be dissolved by warming before use.

LABELLING

The strength is stated as the percentage w/v of Mannitol.

Mebeverine Tablets

General Notices

Action and use

Smooth muscle relaxant; antispasmodic.

DEFINITION

Mebeverine Tablets contain Mebeverine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mebeverine hydrochloride, $C_{25}H_{35}NO_5$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Suspend a quantity of the powdered tablets containing 0.2 g of Mebeverine Hydrochloride in 20 ml of *water*, add 5 ml of 5M *sodium hydroxide* and extract with two 25 ml quantities of *chloroform*. Dry the combined extracts over *anhydrous sodium sulphate* and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of mebeverine *(RS 208)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum at 263 nm and a less well-defined maximum at 292 nm.

TEST

Related substances

Comply with the requirement stated under Mebeverine Hydrochloride using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.2 g of Mebeverine Hydrochloride with 10 ml of *acetone* and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *acetone*. Solution (3) contains 0.01% w/v of *veratric acid* in *acetone*.

ASSAY

Weigh and powder 20 tablets. Heat a quantity of the powdered tablets containing 0.5 g of Mebeverine Hydrochloride with 100 ml of 0.1M *hydrochloric acid* for 10 minutes on a water bath, shaking occasionally. Cool, add sufficient 0.1M *hydrochloric acid* to produce 250 ml and filter. To 10 ml of the filtrate add sufficient 0.1M *hydrochloric acid* to produce 100 ml and dilute 15 ml of the resulting solution to 100 ml with the same solvent. Measure the *absorbance* of the solution at the maximum at 263 nm, Appendix II B. Calculate the content of $C_{25}H_{35}NO_5$, HCl taking 263 as the value of A(1%, 1 cm) at the maximum at 263 nm.

STORAGE

Mebeverine Tablets should be kept in an airtight container, protected from light and stored at a temperature not exceeding 30°.

Medroxyprogesterone Injection

General Notices

Action and Use

Progestogen.

DEFINITION

Medroxyprogesterone Injection is a sterile suspension of Medroxyprogesterone Acetate in a suitable vehicle

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of medroxyprogesterone acetate, $C_{24}H_{34}O_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Dissolve a volume of the injection containing 50 mg of Medroxyprogesterone Acetate in 8 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with three 8-ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *petroleum spirit* (*boiling range, 40° to 60°*), dilute with *water* until the solution becomes turbid, allow to stand in ice for 2 hours and filter. Wash the precipitate with *water* and dry at 105°. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of medroxyprogesterone acetate (*RS 421*).

TESTS

Impurity F (6a-methyl-3,20-dioxo-5b-pregnan-17-yl acetate)

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) The injection, diluted with *dichloromethane* if necessary, to contain 2.0% w/v of Medroxyprogesterone Acetate.

(2) 2.0% w/v of *medroxyprogesterone acetate for performance test EPCRS* (containing 0.5% of impurity F) in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable)

(b) 10 volumes of *tetrahydrofuran*, 45 volumes of *1,1-dimethylethyl methyl ether* and 45 volumes of *hexane* as the mobile phase.

(c) Apply to the plate 10 µl of each of solutions (1) and (2).

(d) After removal of the plate, allow it to dry in air and carry out a second development in the same direction using a freshly prepared mobile phase.

(e) Dry the plate at 100° to 105° and allow to cool, spray with a 200 g/l solution of *toluenesulphonic acid* in *ethanol (96 per cent)*. Heat at 120 °C for 10 min, allow to cool and examine the plate in *ultraviolet light 365 nm*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1) any blue fluorescent spot with an Rf value higher than the principal spot is not more intense than the corresponding blue fluorescent spot due to impurity F in the chromatogram obtained with solution (2) (0.5%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the injection containing 40 mg of Medroxyprogesterone Acetate with sufficient of the mobile phase to produce 100 ml.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.002% w/v of *medroxyprogesterone acetate BPCRS* and 0.005% w/v of *megestrol acetate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Prodigy ODS3 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Maintain the temperature of the column at 40°.

(e) Detection wavelength of 241 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 100 volumes of *tetrahydrofuran,* 350 volumes of *acetonitrile,* 500 volumes of *water* and allowed to equilibrate and the volume adjusted to 1000 volumes with *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the two principal peaks is at least 3.3;

the *symmetry factor* of the peak due to medroxyprogesterone acetate is not more than 1.3.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

disregard any peaks with an area not greater than 0.05 times the area of the principal peak in solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) The injection, diluted if necessary with the mobile phase, to contain 0.004% w/v of Medroxyprogesterone Acetate.

(2) 0.004% w/v of *medroxyprogesterone acetate BPCRS* in the mobile phase.

(3) 0.002% w/v of *medroxyprogesterone acetate BPCRS* and 0.005% w/v of *megestrol acetate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the two principal peaks is at least 3.3;

the *symmetry factor* of the peak due to medroxyprogesterone acetate is not more than 1.3.

DETERMINATION OF CONTENT

Calculate the content of medroxyprogesterone acetate, $C_{24}H_{34}O_4$, in the injection using the declared content of $C_{24}H_{34}O_4$ in *medroxyprogesterone acetate BPCRS*.

STORAGE

Medroxyprogesterone Injection should be protected from light. On standing, solid matter may separate; it should be redissolved by heating before use.

IMPURITIES

A. 6-hydroxy-6-methyl-3,20-dioxopregn-4-en-17-yl acetate (6-hydroxymedroxyprogesterone acetate),

B. 17-hydroxy-6-methylpregn-4-ene-3,20-dione (medroxyprogesterone),

C. 6,17a-dimethyl-3,17-dioxo-*D*-homoandrost-4-en-17a-yl acetate,

D. 6-methyl-3,20-dioxopregn-4-en-17-yl acetate (6-epimedroxyprogesterone acetate),

E. 6-methylidene-3,20-dioxopregn-4-en-17-yl acetate (6-methylenehydroxyprogesterone acetate),

F. 6-methyl-3,20-dioxo-5-pregnan-17-yl acetate (4,5-dihydromedroxyprogesterone acetate),

G. 6-methyl-3,20-dioxopregna-4,6-dien-17-yl acetate (megestrol acetate).

Medroxyprogesterone Tablets

General Notices

Action and Use

Progestogen.

DEFINITION

Medroxyprogesterone Tablets contain Medroxyprogesterone Acetate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of medroxyprogesterone acetate, $C_{24}H_{34}O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Disperse a quantity of the powdered tablets containing 50 mg of Medroxyprogesterone Acetate in 8 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with three 8-ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *petroleum spirit* (*boiling range, 40° to 60°*), dilute with *water* until the solution becomes turbid, allow to stand in ice for 2 hours and filter. Wash the precipitate with water and dry at 105°. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of medroxyprogesterone acetate *(RS 421)*.

TESTS

Dissolution

Comply with the dissolution test for tablets and capsules, Appendix XII D, using apparatus 2. Use as the medium 900 ml of 0.5% w/v *sodium lauryl sulphate* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of the medium and filter.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the filtrate add sufficient of a solution of 0.5% w/v *sodium lauryl sulphate* to produce a solution expected to contain 0.0028% w/v of Medroxyprogesterone Acetate.

(2) 0.0028% w/v of *medroxyprogesterone acetate BPCRS* in a solution of 0.5% w/v *sodium lauryl sulphate*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (8 cm × 4 mm) packed with *octylsilyl silica gel for chromatography R1* (10 µm) (Zorbax C8 is suitable)

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 254 nm.

(f) Injection volume of 20µl for each solution.

MOBILE PHASE

40 volumes of *water* and 60 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of medroxyprogesterone acetate, $C_{24}H_{34}O_4$, in the medium using the declared content of $C_{24}H_{34}O_4$ in *medroxyprogesterone acetate BPCRS*.

Impurity F (6a-methyl-3,20-dioxo-5b-pregnan-17-yl acetate)

Carry out the method for *thin-layer chromatography*, Appendix III A using the following solutions.

(1) Shake a quantity of powdered tablets containing 0.2 g of Medroxyprogesterone Acetate with *dichloromethane*, add sufficient *dichloromethane* to produce 10 ml, centrifuge and use the supernatant liquid.

(2) 2.0% w/v of *medroxyprogesterone acetate for performance test EPCRS* (containing 0.5% of impurity F) in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as coating *silica gel* (Merck silica gel 60 plates are suitable)

(b) 10 volumes of *tetrahydrofuran*, 45 volumes of *1,1-dimethylethyl methyl ether* and 45 volumes of *hexane* as the mobile phase.

(c) Apply to the plate 10 µl of each of solutions (1) and (2).

(d) After removal of the plate, allow the plate to dry in air and carry out a second development in the same direction using a freshly prepared mobile phase.

(e) Dry the plate at 100° to 105° and allow to cool, spray with a 200 g/l solution of *toluenesulphonic acid* in *ethanol (96 per cent)*. Heat at 120 °C for 10 min, allow to cool and examine the plate in *ultraviolet light 365 nm*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1) any blue fluorescent spot with an Rf value higher than that of the principal spot is not more intense than the corresponding blue fluorescent spot due to impurity F in the chromatogram obtained with solution (2) (0.5%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 40 mg of Medroxyprogesterone Acetate with 50 ml of the mobile phase for 15 minutes, add sufficient of the mobile phase to produce 100 ml, mix, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.002% w/v of *medroxyprogesterone acetate BPCRS* and 0.005% w/v of *megestrol acetate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Prodigy ODS3 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Maintain the temperature of the column at 40°.

(e) Detection wavelength of 241 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 100 volumes of *tetrahydrofuran,* 350 volumes of *acetonitrile,* 500 volumes of *water* and allowed to equilibrate and the volume adjusted to 1000 volumes with *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the two principal peaks is at least 3.3;

the *symmetry factor* of the peak due to medroxyprogesterone acetate is not more than 1.3.

LIMITS

In the chromatogram obtained with solution (1):

the area of any secondary peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

disregard any peaks with an area not greater than 0.05 times the area of the principal peak in solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 40 mg of Medroxyprogesterone Acetate with 50 ml of the mobile phase for 15 minutes, add sufficient of the mobile phase to produce 100 ml, mix and filter. To 5ml of the filtrate add sufficient of the mobile phase to produce 50 ml.

(2) 0.004% w/v of *medroxyprogesterone acetate BPCRS* in the mobile phase.

(3) 0.002% w/v of *medroxyprogesterone acetate BPCRS* and 0.005% w/v of *megestrol acetate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the two principal peaks is at least 3.3;

the *symmetry factor* of the peak due to medroxyprogesterone acetate is not more than 1.3.

DETERMINATION OF CONTENT

Calculate the content of medroxyprogesterone acetate, $C_{24}H_{34}O_4$, in the tablets using the declared content of $C_{24}H_{34}O_4$ in *medroxyprogesterone acetate BPCRS*.

IMPURITIES

A. 6-hydroxy-6-methyl-3,20-dioxopregn-4-en-17-yl acetate (6-hydroxymedroxyprogesterone acetate),

B. 17-hydroxy-6-methylpregn-4-ene-3,20-dione (medroxyprogesterone),

C. 6,17a-dimethyl-3,17-dioxo-*D*-homoandrost-4-en-17a-yl acetate,

D. 6-methyl-3,20-dioxopregn-4-en-17-yl acetate (6-epimedroxyprogesterone acetate),

E. 6-methylidene-3,20-dioxopregn-4-en-17-yl acetate (6-methylenehydroxyprogesterone acetate),

F. 6-methyl-3,20-dioxo-5-pregnan-17-yl acetate (4,5-dihydromedroxyprogesterone acetate),

G. 6-methyl-3,20-dioxopregna-4,6-dien-17-yl acetate (megestrol acetate).

Mefenamic Acid Capsules

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Mefenamic Acid Capsules contain Mefenamic Acid.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of mefenamic acid, $C_{15}H_{15}NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the contents of the capsules containing 0.25 g of Mefenamic Acid with two 30-ml quantities of *ether*. Wash the combined extracts with *water*, evaporate to dryness on a water bath and dry the residue at 105°. Dissolve a sufficient quantity in the minimum volume of *absolute ethanol* and evaporate to dryness on a water bath. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of mefenamic acid *(RS 210)*.

TESTS

Disintegration

Maximum time, 15 minutes, Appendix XII A1.

2,3-Dimethylaniline

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel G plate* and a mixture of 1 volume of 18M *ammonia*, 25 volumes of *1,4-dioxan* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.25 g of Mefenamic Acid with a mixture of 7.5 ml of *dichloromethane* and 2.5 ml of *methanol*, allow the insoluble matter to settle and use the supernatant liquid. Solution (2) contains 0.00025% w/v of *2,3-dimethylaniline* in a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol*. After removal of the plate, dry it in a current of warm air and visualise by *Method I*. Any spot corresponding to 2,3-dimethylaniline in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (100 ppm).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel GF_{254} plate* and a mixture of 1 volume of *glacial acetic acid*, 25 volumes of *1,4-dioxan* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) use the supernatant liquid obtained in the test for 2,3-Dimethylaniline. For solution (2) dilute 1 volume of solution (1) to 500 volumes with a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol*. After removal of the plate, allow it to dry in air, expose to iodine vapour for 5 minutes and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Dissolve a quantity of the mixed contents of 20 capsules containing 0.5 g of Mefenamic Acid in 100 ml of warm *absolute ethanol* previously neutralised to *phenol red solution* and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 24.13 mg of $C_{15}H_{15}NO_2$.

Mefenamic Acid Tablets

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Mefenamic Acid Tablets contain Mefenamic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mefenamic acid, $C_{15}H_{15}NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.25 g of Mefenamic Acid with two 30-ml quantities of *ether*. Wash the combined extracts with *water*, evaporate to dryness on a water bath and dry the residue at 105°. Dissolve a sufficient quantity in the minimum volume of *absolute ethanol* and evaporate to dryness on a water bath. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of mefenamic acid *(RS 210)*.

TESTS

2,3-Dimethylaniline

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel G plate* and a mixture of 1 volume of 18M *ammonia*, 25 volumes of *1,4-dioxan* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 40 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Mefenamic Acid with a mixture of 7.5 ml of *dichloromethane* and 2.5 ml of *methanol* for 10 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 0.00025% w/v of *2,3-dimethyl-aniline* in a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol*. After removal of the plate, dry it in a current of warm air and visualise by *Method I*. Any spot corresponding to 2,3-dimethylaniline in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (100 ppm).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and a mixture of 1 volume of *glacial acetic acid*, 25 volumes of *1,4-dioxan* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) use the supernatant liquid obtained in the test for 2,3-Dimethylaniline. For solution (2) dilute 1 volume of solution (1) to 500 volumes with a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol*. After removal of the plate, allow it to dry in air, expose to iodine vapour for 5 minutes and examine under *ultraviolet light (254* *nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%). Disregard any spot with an Rf value of 0.04 or less.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powdered tablets containing 0.5 g of Mefenamic Acid in about 80 ml of warm *absolute ethanol* previously neutralised to *phenol red solution* alternating between heating and ultrasound to aid dissolution. Cool, add sufficient of the neutralised absolute ethanol to produce 100 ml, mix well and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 24.13 mg of $C_{15}H_{15}NO_2$.

Megestrol Tablets

General Notices

Action and use

Progestogen.

DEFINITION

Megestrol Tablets contain Megestrol Acetate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of megestrol acetate, $C_{24}H_{32}O_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 40 mg of Megestrol Acetate with 250 ml of *chloroform* for 30 minutes, filter into a separating funnel, wash the filtrate with 20 ml of *water* and evaporate the chloroform. The residue, after drying at 60° at a pressure not exceeding 0.7 kPa for 2 hours, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of megestrol acetate *(RS 211)*.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent II* and *mobile phase D*.

TESTS

Disintegration

Maximum time, 30 minutes, Appendix XII A1.

Related foreign steroids

Carry out the method for *thin-layer chromatography,* Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 0.5 volume of *water,* 8 volumes of *methanol* and 92 volumes of *1,2-dichloroethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Megestrol Acetate with 10 ml of a mixture of 1 volume of *methanol* and 9 volumes of *chloroform* for 10 minutes, centrifuge and use the clear supernatant liquid. Solution (2) contains 0.005% w/v of *megestrol BPCRS* in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform*. After removal of the plate, allow it to dry in air, spray with *ethanolic sulphuric acid (20%),* heat at 110° for 10 minutes and examine under *ultraviolet light (365 nm).* Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense that the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Prepare a 0.016% w/v solution of *propyl 4-hydroxybenzoate* (internal standard) in *acetonitrile* (solution A) and carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix 4 ml of a 0.02% w/v solution of *megestrol acetate BPCRS* in *acetonitrile* with 10 ml of solution A and dilute to 50 ml with a 40% v/v solution of *acetonitrile*. For solution (2) shake a quantity of the powdered tablets containing 0.08 g of Megestrol Acetate with 10 ml of *water* for 10 minutes, add 75 ml of *acetonitrile*, shake for 30 minutes, dilute to 100 ml with *acetonitrile*, centrifuge and dilute 10 ml of the clear supernatant liquid to 50 ml with a 40% v/v solution of *acetonitrile*; to 5 ml of this solution add 10 ml of *acetonitrile* and dilute to 50 ml with a 40% v/v solution of *acetonitrile*. Prepare solution (3) in the same manner as solution (2) but adding 10 ml of solution A in place of the 10 ml of acetonitrile.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 32 volumes of *water* and 68 volumes of *acetonitrile* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 280 nm.

The assay is not valid unless in the chromatogram obtained with solution (1) the *resolution factor* between the peaks due to propyl 4-hydroxybenzoate and megestrol acetate is at least 8.

Calculate the content of $C_{24}H_{32}O_4$ using the declared content of $C_{24}H_{32}O_4$ in *megestrol acetate BPCRS*.

Meglumine Amidotrizoate Injection

General Notices

Action and use

Organic base used in the preparation of organic acids.

DEFINITION

Meglumine Amidotrizoate Injection is a sterile solution of the Meglumine salt of Amidotrizoic Acid Dihydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of meglumine amidotrizoate, $C_{11}H_9I_3N_2O_4,C_7H_{17}NO_5$

97.0 to 103.0% of the stated amount.

CHARACTERISTICS

A colourless to pale yellow, slightly viscous liquid.

IDENTIFICATION

A. Evaporate 2 ml of the injection to dryness and heat 50 mg of the residue. Violet vapours of iodine are evolved.

B. To 20 mg of the residue obtained by evaporating the injection to dryness add 5 ml of 1M *sodium hydroxide* and boil gently under a reflux condenser for 10 minutes. Cool, add 5 ml of 2M *hydrochloric acid* and cool in ice for 5 minutes. Add 4 ml of a 1% w/v solution of *sodium nitrite*, cool in ice for 5 minutes, add 0.3 g of *sulphamic acid*, swirl gently until effervescence ceases and add 2 ml of a 0.4% w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride*. An orange-red colour is produced.

C. To a quantity containing 1 g of meglumine amidotrizoate add 50 ml of *water* and a slight excess of 2M *hydrochloric acid* and filter. Evaporate the filtrate to dryness on a water bath, dissolve the residue in a small quantity of boiling *ethanol (90%)*, filter and cool the filtrate in ice. The *melting point* of the dried precipitate is about 146°, Appendix V A.

TESTS

Acidity or alkalinity

pH, 6.0 to 7.0, Appendix V L.

Meglumine

22.9 to 25.3% of the stated content of meglumine amidotrizoate when determined by the following method. Measure the *optical rotation* of the injection, Appendix V F, using a 2-dm tube. Calculate the percentage content of meglumine using the expression 2.104*R* where *R* is the numerical value of the rotation.

Free amine

To a quantity containing 1 g of meglumine amidotrizoate in a 50 ml glass-stoppered graduated flask add sufficient *water* to produce 5 ml, 10 ml of 0.1M *sodium hydroxide* and 25 ml of *dimethyl sulphoxide*. Stopper the flask, mix the contents by gentle swirling and cool in ice, protected from light. After 5 minutes add slowly 2 ml of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 2% w/v solution of *sodium nitrite*, mix and allow to stand for 5 minutes. Add 1 ml of an 8% w/v solution of *sulphamic acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 0.1% w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride* in a 70% v/v solution of *propane-1,2-diol* and mix. Remove the flask from the ice and allow to stand in water at 22° to 25° for 10 minutes, occasionally shaking gently. Add sufficient *dimethyl sulphoxide* to produce 50 ml and mix. Within 5 minutes of diluting to 50 ml measure the *absorbance* of the resulting solution at the maximum at 470 nm, Appendix II B, using in the reference cell a solution prepared by treating 5 ml of *water* in the same manner. The absorbance is not more than 0.40.

Inorganic iodide

Dilute a quantity containing 0.80 g of meglumine amidotrizoate to 10 ml with *water*, add sufficient 2M *nitric acid* dropwise to ensure complete precipitation of the iodinated acid and add 3 ml in excess. Filter, wash the precipitate with 5 ml of *water*, add to the filtrate 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *chloroform* and shake. Any purple colour in the chloroform layer is not more intense than that obtained by adding 2 ml of *iodide standard solution (20 ppm I)* to a mixture of 3 ml of 2M *nitric acid* and sufficient *water* to equal the volume of the test solution, adding 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *chloroform* and shaking (50 ppm).

Pyrogens

Complies with the *test for pyrogens*, Appendix XIV D. Use per kg of the rabbit's weight a quantity containing 2.5 g of meglumine amidotrizoate.

ASSAY

Mix a quantity containing 0.5 g of meglumine amidotrizoate with 12 ml of 5M *sodium hydroxide* and 20 ml of *water*, add 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through absorbent cotton and wash the flask and filter with two 20 ml quantities of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with 0.05M *potassium iodate VS* until the dark brown solution becomes light brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless. Each ml of 0.05M *potassium iodate VS* is equivalent to 26.97 mg of $C_{11}H_9I_3N_2O_4,C_7H_{17}NO_5$. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of $C_{11}H_9I_3N_2O_4,C_7H_{17}NO_5$.

STORAGE

Meglumine Amidotrizoate Injection should be protected from light.

LABELLING

The strength is stated as the percentage w/v of meglumine amidotrizoate.

Meglumine Iodipamide Injection

General Notices

Action and use

Organic base used in the preparation of organic acids.

DEFINITION

Meglumine Iodipamide Injection is a sterile solution of the Meglumine salt of 3,3′-adipoyldiamino-bis(2,4,6-tri-iodobenzoic acid) (2:1) in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of meglumine iodipamide, $C_{20}H_{14}I_6N_2O_6,2C_7H_{17}NO_5$

97.0 to 103.0% of the stated amount.

CHARACTERISTICS

A colourless to pale yellow solution.

IDENTIFICATION

A. To a volume of the injection containing 0.6 g of meglumine iodipamide add 1 ml of 1M *hydrochloric acid*, stir until the precipitate becomes crystalline, add 5 ml of 1M *hydrochloric acid*, stir, filter and reserve the filtrate for test C. Wash the residue with 1M *hydrochloric acid* and then with *water* and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of iodipamide *(RS 191)*.

B. Heat 50 mg of the residue obtained in test A. Violet vapours of iodine are evolved.

C. Evaporate the filtrate reserved in test A to dryness on a water bath, dissolve the residue in a small quantity of boiling *ethanol (90%)*, filter and cool the filtrate in ice. The *melting point* of the dried precipitate is about 146°, Appendix V A.

TESTS

Acidity or alkalinity

pH, 6.0 to 7.1, Appendix V L.

Meglumine

11.8 to 13.7% of the stated content of meglumine iodipamide when determined by the following method. Measure the *optical rotation* of the injection, Appendix V G, using a 2-dm tube. Calculate the percentage content of meglumine using the expression 2.104*R* where *R* is the numerical value of the rotation.

Free amine

To a quantity containing 0.25 g of meglumine iodipamide add 25 ml of *water*, 8 ml of 1M *hydrochloric acid* and 4 ml of a 1.0% w/v solution of *sodium nitrite* and shake for 2 minutes. Add 6 ml of a 2% w/v solution of *ammonium sulphamate* and swirl gently until effervescence ceases. Add 0.4 ml of a 10% w/v solution of *1-naphthol* in *ethanol (96%)*, shake and add 3 ml of 5M *sodium hydroxide*. Dilute the solution to 50 ml with *water* and measure the *absorbance* at the maximum at 485 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but omitting the injection. The absorbance is not more than 0.17.

Inorganic iodide

Dilute a quantity containing 0.80 g of meglumine iodipamide to 10 ml with *water*, add sufficient 2M *nitric acid* dropwise to ensure complete precipitation of the iodinated acid and add 3 ml in excess. Filter, wash the precipitate with 5 ml of *water*, add to the filtrate 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *chloroform* and shake. Any purple colour in the chloroform layer is not more intense than that obtained by adding 2 ml of *iodide standard solution (20 ppm I)* to a mixture of 3 ml of 2M *nitric acid* and sufficient *water* to equal the volume of the test solution, adding 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *chloroform* and shaking (50 ppm).

Pyrogens

Complies with the *test for pyrogens*, Appendix XIV D. Use per kg of the rabbit's weight a quantity containing 1.25 g of meglumine iodipamide.

ASSAY

Mix 0.4 g with 12 ml of 5M *sodium hydroxide* and 20 ml of *water*, add 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through absorbent cotton and wash the flask and filter with two 20 ml quantities of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with 0.05M *potassium iodate VS* until the dark brown solution becomes light brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless. Each ml of 0.05M *potassium iodate VS* is equivalent to 25.50 mg of $C_{20}H_{14}I_6N_2O_6,2C_7H_{17}NO_5$. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of $C_{20}H_{14}I_6N_2O_6,2C_7H_{17}NO_5$.

LABELLING

The strength is stated as the percentage w/v of meglumine iodipamide.

Meloxicam Tablets

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Meloxicam Tablets contain Meloxicam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of meloxicam, $C_{14}H_{13}N_3O_4S_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the powdered tablets containing 50 mg of Meloxicam, add 5 ml of 0.1M *methanolic sodium hydroxide* and 20 ml of *methanol*, stir for 15 minutes and filter.

(2) Dissolve 50 mg of *meloxicam BPCRS* in 5 ml of 0.1M *methanolic sodium hydroxide* and add sufficient *methanol* to produce 25 ml of solution.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel* F_{254} *plate* (Merck HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

1 volume of 13.5M *ammonia*, 20 volumes of *methanol* and 80 volumes of *dichloromethane.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 ml of a buffer prepared by dissolving 13.61 g of *potassium dihydrogen orthophosphate* in 800 ml of *water*, adjusting the pH to 7.5 with 0.5M *sodium hydroxide*, adding sufficient *water* to produce 1000 ml, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and filter. Measure the absorbance of the filtrate, Appendix II B, diluted with the dissolution medium if necessary, at 362 nm using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a solution prepared by dissolving 30 mg of *meloxicam BPCRS* in 5 ml of *methanol*, adding 1 ml of 0.1M *sodium hydroxide* and adding sufficient dissolution medium to produce 100 ml. Dilute a volume of the resulting solution with sufficient dissolution medium to produce a solution containing 0.00075% w/v of Meloxicam.

DETERMINATION OF CONTENT

Calculate the total content of Meloxicam, $C_{14}H_{13}N_3O_4S_2$, in the medium using the declared content of $C_{14}H_{13}N_3O_4S_2$ in *meloxicam BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Moisten a quantity of powdered tablets containing 30 mg of Meloxicam with 10 ml of 1M *sodium hydroxide*, add 40 ml of *methanol* and mix with the aid of ultrasound for 5 minutes. Add a further 40 ml of *methanol*, mix for 3 hours using a magnetic stirrer and then with the aid of ultrasound for 5 minutes. Cool, add sufficient *methanol* to produce 100 ml and filter.

(2) Dilute 2 volumes of solution (1) to 100 volumes with *methanol*. Dilute 1 volume to 10 volumes with *methanol*.

(3) Dissolve 4.5 mg of *5-methylthiazole-2-ylamine* in 20 ml of 1M *sodium hydroxide* and 20 ml of *methanol*, cool and add sufficient *methanol* to produce 200 ml. Dilute 2 volumes to 100 volumes with *methanol*.

(4) Mix equal volumes of solution (1) and solution (3).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Kromasil 100 C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 ml per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

370 volumes of a mixture of 650 volumes of *methanol* and 100 volumes of *propan-2-ol* and 630 volumes of a 0.20% w/v solution of *diammonium hydrogen orthophosphate* adjusted to pH 7.0 with *dilute orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to 5-methylthiazole-2-ylamine is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.15%);

— the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— and the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Moisten a quantity of the powdered tablets containing 30 mg of Meloxicam with 10 ml of 1M *sodium hydroxide*, add 40 ml of *methanol* and mix with the aid of ultrasound for 5 minutes. Add a further 40 ml of *methanol*, mix for 3 hours using a magnetic stirrer and then with the aid of ultrasound for 5 minutes. Cool, add sufficient *methanol* to produce 100 ml and filter.

(2) Dissolve 30 mg of *meloxicam BPCRS* in 10 ml of 1M *sodium hydroxide* and 40 ml of *methanol*, cool and add sufficient *methanol* to produce 100 ml.

(3) Dissolve 4.5 mg of *2-amino-5-methylthiazole* in 20 ml of 1M *sodium hydroxide* and 20 ml of *methanol*, cool and add sufficient *methanol* to produce 200 ml. Dilute 2 volumes to 100 volumes with *methanol*.

(4) Mix equal volumes of solution (1) and solution (3).

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{13}N_3O_4S_2$ using the declared content of $C_{14}H_{13}N_3O_4S_2$ in *meloxicam BPCRS.*

Melphalan Injection

General Notices

Action and use

Cytotoxic alkylating agent.

DEFINITION

Melphalan Injection is a sterile solution of melphalan hydrochloride. It is prepared immediately before use by dissolving Melphalan for Injection in a suitable solvent and then diluting with the requisite volume of a suitable diluent in accordance with the manufacturer's instructions.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

TESTS

Acidity or alkalinity

6.0 to 7.0, Appendix V L.

Clarity of solution

Not more opalescent than *reference suspension II*, Appendix IV A.

STORAGE

Melphalan Injection deteriorates on storage and should be used immediately after preparation.

MELPHALAN FOR INJECTION

DEFINITION

Melphalan for Injection is a sterile material consisting of Melphalan with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of melphalan, $C_{13}H_{18}Cl_2N_2O_2$

90.0 to 110.0% of the stated amount of anhydrous melphalan.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.001% w/v solution in *methanol* exhibits a maximum at 260 nm and a less well-defined maximum at 310 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (1).

C. Dissolve a quantity containing the equivalent of 20 mg of anhydrous melphalan in 50 ml of *methanol* with the aid of gentle heat, add 1 ml of a 5% w/v solution of *4-(4-nitrobenzyl) pyridine* in *acetone* and evaporate to dryness. Dissolve the residue in 1 ml of hot *methanol* and add 0.1 ml of 13.5M *ammonia*. A red colour is produced.

D. Heat a quantity of the powder containing 0.1 g of anhydrous melphalan with 10 ml of 0.1M *sodium hydroxide* for 10 minutes on a water bath. The resulting solution, after acidification with 2M *nitric acid*, yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Ionisable chlorine

Dissolve a quantity containing the equivalent of 0.1 g of anhydrous melphalan in a mixture of 15 ml of *water* and 0.5 ml of *nitric acid*, allow to stand for 2 minutes and titrate with 0.02M *silver nitrate VS* determining the end point potentiometrically. Not more than 1.7 ml is required.

Uniformity of content

Sealed containers containing the equivalent of 100 mg or less of anhydrous melphalan comply with the requirements stated under Parenteral Preparations, Powders for Injections. Use the individual results obtained in the Assay.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *melphalan BPCRS* in a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid*. For solution (2) dissolve the contents of one container in a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid* and dilute with sufficient of the same solvent mixture to produce a final solution containing the equivalent of 0.01% w/v of anhydrous melphalan.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 200 volumes of a 0.375% w/v solution of *ammonium carbonate*, 180 volumes of *methanol* and 2.7 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the amount of $C_{13}H_{18}Cl_2N_2O_2$ in the sealed container using the declared content of $C_{13}H_{18}Cl_2N_2O_2$ in *melphalan BPCRS*.

Repeat the procedure with a further nine sealed containers and calculate the average content of $C_{13}H_{18}Cl_2N_2O_2$ per container from the 10 individual results thus obtained.

LABELLING

The label of the sealed container states the equivalent amount of anhydrous melphalan contained in it.

Melphalan Tablets

General Notices

Action and use

Cytotoxic alkylating agent.

DEFINITION

Melphalan Tablets contain Melphalan. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of melphalan, $C_{13}H_{18}Cl_2N_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 25 mg of Melphalan with 50 ml of hot *methanol*, filter and dilute 5 ml of the filtrate to 500 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum at 260 nm and a less well-defined maximum at 301 nm.

B. To the remainder of the filtrate obtained in test A add 1 ml of a 5% w/v solution of *4-(4-nitrobenzyl)pyridine* in *acetone* and evaporate to dryness. Dissolve the residue in 1 ml of hot *methanol* and add 0.1 ml of 13.5M *ammonia*. A red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of a 0.10% w/v solution of *melphalan BPCRS* in a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid* with sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.0002% w/v. For solution (2) dilute the filtered solution, if necessary, with 0.1M *hydrochloric acid* to give a solution expected to contain about 0.0002% w/v of Melphalan.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 2.7 volumes of *glacial acetic acid*, 180 volumes of *methanol* and 200 volumes of a 0.375% w/v solution of *ammonium carbonate* as the mobile phase with a flow rate of 2 ml per minute, (c) a detection wavelength of 254 nm and (d) a 100-µl loop injector.

Calculate the content of melphalan, $C_{13}H_{18}Cl_2N_2O_2$ in the medium using the declared content of $C_{13}H_{18}Cl_2N_2O_2$ in *melphalan BPCRS*.

Uniformity of content

Tablets containing 2 mg or less of Melphalan comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *melphalan BPCRS* in a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid*. For solution (2) add 20 ml of a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid* to one tablet, mix with the aid of ultrasound for 10 minutes or until the tablet has disintegrated, filter, discarding the first 5 ml of filtrate, and use the filtrate.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 200 volumes of a 0.375% w/v solution of *ammonium carbonate*, 180 volumes of *methanol* and 2.7 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ using the declared content of $C_{13}H_{18}Cl_2N_2O_2$ in *melphalan BPCRS*.

ASSAY

For tablets containing more than 2 mg of Melphalan

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *melphalan BPCRS* in a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid*. For solution (2) add about 300 ml of a mixture of 4 volumes of *acetonitrile* and 1 volume of 0.1M *hydrochloric acid* to 10 tablets, shake until the tablets have disintegrated (about 30 minutes), mix with the aid of ultrasound for 5 minutes, dilute to 500 ml with the same solvent mixture, filter, discarding the first 20 ml of filtrate, and use the filtrate.

The chromatographic procedure described under Uniformity of content may be used.

Calculate the content of $C_{13}H_{18}Cl_2N_2O_2$ in the tablets using the declared content of $C_{13}H_{18}Cl_2N_2O_2$ in *melphalan BPCRS*.

For tablets containing 2 mg or less of Melphalan

Use the average of the 10 individual results determined in the test for Uniformity of content.

Menadiol Phosphate Injection

General Notices

Action and use

Vitamin K analogue.

DEFINITION

Menadiol Phosphate Injection is a sterile solution of Menadiol Sodium Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of menadiol phosphate, $C_{11}H_{12}O_8P_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the injection containing the equivalent of 0.2 g of menadiol phosphate to 20 ml with *water* and add 20 ml of 1M *sulphuric acid*, 20 ml of 0.1M *cerium*(IV) *sulphate* and 2 ml of *hydrogen peroxide solution (20 vol)*. Extract with two 20 ml quantities of *chloroform*, evaporate the combined chloroform extracts to dryness on a water bath and dry the residue at 40° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of menadione *(RS 214)*.

B. To 50 mg of the residue obtained in test A add 5 ml of *water* followed by 75 mg of *sodium metabisulphite* and heat in a water bath, shaking vigorously, until an almost colourless solution is obtained. Dilute to 50 ml with *water*. To 2 ml of the resulting solution add 2 ml of a mixture of equal volumes of *ethanol (96%)* and 13.5M *ammonia*, shake and add 0.15 ml of *ethyl cyanoacetate*. A deep purplish-blue colour is produced which changes to green on the addition of 1 ml of 10M *sodium hydroxide*.

TESTS

Acidity or alkalinity

pH, 7.0 to 8.0, Appendix V L.

Related substances

A. Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 50 volumes of *propan-1-ol*, 50 volumes of a 2% w/v solution of *ammonium chloride*, 5 volumes of *butan-1-ol* and 1.5 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) evaporate a volume of the injection containing the equivalent of 0.5 g of menadiol phosphate to dryness and dissolve the residue in 10 ml of *methanol (50%)*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*. Solutions (3) and (4) contain 0.0025% w/v of *methyl 4-hydroxybenzoate* and 0.0025% w/v *of propyl 4-hydroxybenzoate* respectively in *methanol (50%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Disregard any spots corresponding to those in the chromatograms obtained with solutions (3) and (4).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 80 volumes of *cyclohexane*, 20 volumes of *ether* and 1 volume of *methanol* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. Solution (1) is the injection diluted, if necessary, with *methanol* to contain the equivalent of 1.0% w/v of menadiol phosphate. Solution (2) contains 0.0050% w/v of *2-methyl-1,4-naphthoquinone* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to 2-methyl-1,4-naphthoquinone (menadione) in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Dilute, if necessary, a volume of the injection containing the equivalent of 50 mg of menadiol phosphate to 50 ml with *water*. Dilute 5 ml of the solution to 100 ml with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B. Calculate the content of $C_{11}H_{12}O_8P_2$ taking the value of A(1%, 1 cm), for a solution of $C_{11}H_8Na_4O_8P_2$ in 0.1M *hydrochloric acid*, to be 138 at the maximum at 290 nm. Each mg of $C_{11}H_8Na_4O_8P_2$ (menadiol sodium phosphate) is equivalent to 0.792 mg of $C_{11}H_{12}O_8P_2$ (menadiol phosphate).

LABELLING

The strength is stated in terms of the equivalent amount of menadiol phosphate in a suitable dose-volume.

Menadiol Phosphate Tablets

General Notices

Action and use

Vitamin K analogue.

DEFINITION

Menadiol Phosphate Tablets contain Menadiol Sodium Phosphate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of menadiol phosphate, $C_{11}H_{12}O_8P_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 0.15 g of menadiol phosphate with 15 ml of *water*, centrifuge and filter the supernatant liquid. To 10 ml of the filtrate add 10 ml of 1M *sulphuric acid*, 10 ml of 0.1M *cerium(IV) sulphate* and 1 ml of *hydrogen peroxide solution (20 vol)* and extract with two 10 ml quantities of *chloroform*. Evaporate the combined chloroform extracts to dryness in a water bath and dry the residue at 40° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of menadione *(RS 214)*.

B. To 50 mg of the residue obtained in test A add 5 ml of *water* followed by 75 mg of *sodium metabisulphite*, heat in a water bath, shaking vigorously, until an almost colourless solution is obtained and dilute to 50 ml with *water*. To 2 ml of the resulting solution add 2 ml of a mixture of equal volumes of 13.5M *ammonia* and *ethanol (96%)*, shake and add 0.15 ml of *ethyl cyanoacetate*. A deep purplish-blue colour is produced which changes to green on the addition of 1 ml of 10M *sodium hydroxide*.

TESTS

Related substances

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 50 volumes of *propan-1-ol*, 50 volumes of a 2% w/v solution of *ammonium chloride*, 5 volumes of *butan-1-ol* and 1.5 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 0.25 g of menadiol phosphate with 10 ml of *methanol (50%)* and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*. Solution (3) contains 0.0080% w/v of *2-methyl-1,4-naphthoquinone* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3). Examine the plate under *ultraviolet light (365 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 10 mg of menadiol phosphate with 100 ml of 0.1M *hydrochloric acid* for 30 minutes. Dilute to 250 ml with 0.1M *hydrochloric acid*, filter and measure the *absorbance* of the filtrate at the maximum at 290 nm, Appendix II B. Calculate the content of $C_{11}H_{12}O_8P_2$ taking the value of A (1%, 1 cm), for a solution of $C_{11}H_8Na_4O_8P_2$ in 0.1M *hydrochloric acid*, to be 138 at the maximum at 290 nm. Each mg of $C_{11}H_8Na_4O_8P_2$ (menadiol sodium phosphate) is equivalent to 0.792 mg of $C_{11}H_{12}O_8P_2$ (menadiol phosphate).

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of menadiol phosphate.

Menotrophin Injection

General Notices

Action and use

1:1 ratio of follicle stimulating hormone and luteinizing hormone.

DEFINITION

Menotrophin Injection is a sterile solution of Menotrophin in Water for Injections. It is prepared by dissolving Menotrophin for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Menotrophin Injection should be used immediately after preparation.

MENOTROPHIN FOR INJECTION

DEFINITION

Menotrophin for Injection is a sterile material consisting of Menotrophin with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

Cause enlargement of the ovaries of immature female rats and increase the weight of the seminal vesicles and prostate gland of immature male rats when administered as directed in the Assay.

TESTS

Acidity or alkalinity

Dissolve the contents of the sealed container in 3 ml of *water* (solution A). The pH is 6.0 to 8.0, Appendix V L.

Clarity and colour of solution

Solution A is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method I.

Water

Not more than 5% w/w when determined by *gas chromatography*, Appendix III B, using throughout dry glassware which may be siliconised and the following solutions. For solution (1) dilute 15 µl of *anhydrous methanol* (internal standard) with sufficient *propan-2-ol R1* to produce 100 ml. For solution (2) dissolve 4 mg of the contents of the sealed container in 0.5

ml of *propan-2-ol R1*. For solution (3) dissolve 4 mg of the contents of the sealed container in 0.5 ml of solution (1). For solution (4) add 10 µl of *water* to 50 ml of solution (1).

The chromatographic procedure may be carried out using a stainless steel column (1 m × 2 mm) packed with porous polymer beads (60 to 80 mesh) (Chromosorb 102 is suitable), maintained at 120° with a thermal conductivity detector maintained at 150° and using *helium* as the carrier gas.

From the chromatograms obtained and taking into account any water detectable in solution (1), calculate the percentage content of water taking 0.9972 g as its weight per ml at 20°.

Pyrogens

Comply with the *test for pyrogens*, Appendix XIV D. Use per kg of the rabbit's weight 1 ml of a solution in *sodium chloride injection* containing 5 IU of follicle stimulating hormone activity per ml.

ASSAY

Carry out the *biological assay of menotrophin* described under Menotrophin. The estimated potency for each component is not less than 80% and not more than 125% of the stated potency. The fiducial limits of error are not less than 64% and not more than 156% of the stated potency.

STORAGE

The sealed container should be protected from light. The contents may be expected to retain their potency for not less than 3 years.

LABELLING

The label of the sealed container states the number of IU (Units) of follicle-stimulating hormone activity, the number of IU (Units) of luteinising hormone activity and, where applicable, the number of IU (Units) of chorionic gonadotrophin activity contained in it.

Menthol and Benzoin Inhalation

General Notices

DEFINITION

Menthol and Benzoin Inhalation is an *inhalation vapour, solution.*

Racementhol or Levomenthol	20 g
Benzoin Inhalation	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Racementhol or the Levomenthol in a portion of the Benzoin Inhalation, add sufficient Benzoin Inhalation to produce 1000 ml and mix.
The inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

Content of total balsamic acids

Not less than 2.8% w/v, calculated as cinnamic acid, $C_9H_8O_2$.

Total solids

9.0 to 12.0% w/v when determined by drying at 105° for 4 hours, Appendix XI A. Use 2 ml.

ASSAY

Boil 10 ml with 25 ml of *ethanolic potassium hydroxide solution* under a reflux condenser for 1 hour. Evaporate the ethanol, disperse the residue in 50 ml of hot *water*, cool, add 80 ml of *water* and 1.5 g of *magnesium sulphate* dissolved in 50 ml of *water*. Mix thoroughly and allow to stand for 10 minutes. Filter, wash the residue on the filter with 20 ml of *water*, acidify the combined filtrate and washings with *hydrochloric acid* and extract with four 40 ml quantities of *ether*. Discard the aqueous solution, combine the ether extracts and extract with successive quantities of 20, 20, 10, 10 and 10 ml of *sodium hydrogen carbonate solution*, washing each aqueous extract with the same 20 ml of *ether*. Discard the ether layers, carefully acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 ml of *chloroform*, filtering each extract through *anhydrous sodium sulphate* supported on absorbent cotton. Distil the chloroform from the combined filtrates until 10 ml remains and remove the remainder in a current of air. Dissolve the residue, with the aid of gentle heat, in 10 ml of *ethanol (96%)*, previously neutralised to *phenol red solution*, cool and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 14.82 mg of total balsamic acids, calculated as cinnamic acid, $C_9H_8O_2$.

LABELLING

The label indicates the pharmaceutical form as 'inhalation vapour'.

Meptazinol Injection

General Notices

Action and use

Opioid receptor partial agonist; analgesic.

DEFINITION

Meptazinol Injection is a sterile solution of Meptazinol Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of meptazinol, $C_{15}H_{23}NO$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 330 nm of the solution obtained in the Assay exhibits a maximum at 273 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of 18M *ammonia*, 20 volumes of *absolute ethanol* and 79 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following two solutions. For solution (1) dilute the injection, if necessary, with *ethanol (96%)* to contain the equivalent of 0.05% w/v of meptazinol. Solution (2) contains 0.05% w/v of *meptazinol hydrochloride BPCRS* in *ethanol (96%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds in intensity, position and size to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 6.0, Appendix V L.

Colour of solution

The injection is not more intensely coloured than *reference solution* Y_5, Appendix IV B, Method II.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of 18M *ammonia*, 30 volumes of *chloroform* and 70 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute a volume of the injection with *water* to produce a solution containing the equivalent of 1.0% w/v of meptazinol. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *water*. For solution (3) dilute a volume of solution (2) with an equal volume of *water*. After removal of the plate, allow it to dry in air, examine under *ultraviolet light (254 nm)*, expose to iodine vapour for 2 hours and examine again. By each method of visualisation, any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Dilute a suitable volume of the injection with sufficient *water* to produce a solution containing the equivalent of 0.01% w/v of meptazinol and measure the *absorbance* at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{15}H_{23}NO$ from the *absorbance* obtained using a 0.01% w/v solution of *meptazinol hydrochloride BPCRS* and from the declared content of $C_{15}H_{23}NO$ in *meptazinol hydrochloride BPCRS*.

LABELLING

The label of the sealed container states the quantity of active ingredient contained in it in terms of the equivalent amount of meptazinol.

Meptazinol Tablets

General Notices

Action and use

Opioid receptor partial agonist; analgesic.

DEFINITION

Meptazinol Tablets contain Meptazinol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of meptazinol, $C_{15}H_{23}NO$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 330 nm of the solution obtained in the Assay exhibits a maximum at 273 nm.

B. Comply with the test described under Meptazinol Injection but preparing solution (1) and solution (2) in the following manner. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 50 mg of meptazinol with 5 ml of *ethanol (96%)*, centrifuge and dilute 1 volume of the supernatant liquid to 50 volumes with *ethanol (96%)*. Solution (2) contains 0.02% w/v of *meptazinol hydrochloride BPCRS* in *ethanol (96%)*.

TEST

Related substances

Comply with the test described under Meptazinol Injection but using the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 0.2 g of meptazinol with 20 ml of *ethanol (96%)*, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *ethanol (96%)*. For solution (3) dilute a volume of solution (2) with an equal volume of *ethanol (96%)*.

ASSAY

To a quantity of the powdered tablets containing the equivalent of 0.2 g of meptazinol add 40 ml of 0.06M *hydrochloric acid*, shake, dilute to 50 ml with the same solvent, filter through a glass-fibre paper (Whatman GF/C paper is suitable); dilute 5 ml of the filtrate to 250 ml with 0.06M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{15}H_{23}NO$ from the *absorbance* obtained using a 0.0080% w/v solution of *meptazinol hydrochloride BPCRS* in 0.06M *hydrochloric acid* and from the declared content of $C_{15}H_{23}NO$ in *meptazinol hydrochloride BPCRS*.

LABELLING

The label states the quantity of active ingredient in terms of the equivalent amount of meptazinol.

Mepyramine Tablets

General Notices

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Mepyramine Tablets contain Mepyramine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mepyramine maleate, $C_{17}H_{23}N_3O,C_4H_4O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Mepyramine Maleate with 10 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of mepyramine maleate *(RS 216)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) is similar in position and size to that in the chromatogram obtained with solution (4).

C. Dissolve a quantity of the powdered tablets containing 0.2 g of Mepyramine Maleate, freed as far as possible from any sugar coating, in 3 ml of *water*, add 2 ml of 5M *sodium hydroxide* and shake with three 3 ml quantities of *ether*. Warm the aqueous layer in a water bath for 10 minutes with 2 ml of *bromine solution*, heat to boiling, cool and add 0.2 ml to a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid*. A bluish-black colour is produced on heating for 15 minutes in a water bath.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 2 volumes of *diethylamine* and 100 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions prepared immediately before use. For solution (1) shake a quantity of the powdered tablets containing 0.4 g of Mepyramine Maleate with 10 ml of *chloroform* and filter. For solution (2) dilute 1 volume of solution (1) to 10 volumes with *chloroform*. Solutions (3), (4), (5) and (6) contain 4% w/v, 0.4% w/v, 0.008% w/v and 0.004% w/v of *mepyramine maleate EPCRS* in *chloroform* respectively. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (5) (0.2%). The test is not valid unless the Rf values of the principal spots in the chromatograms obtained with solutions (1) and (3) are at least 0.2 and unless the spot in the chromatogram obtained with solution (6) is clearly visible. Disregard the spot due to maleic acid on the line of application.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.1 g of Mepyramine Maleate add 75 ml of *water* and 5 ml of 2M *hydrochloric acid*, shake vigorously for 15 minutes and dilute to 100 ml with *water*. Centrifuge and dilute 10 ml of the clear, supernatant liquid to 100 ml with *water*. To 10 ml add 10 ml of 0.1M *hydrochloric acid* and dilute to 100 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 316 nm, Appendix II B. Calculate the content of $C_{17}H_{23}N_3O,C_4H_4O_4$ taking 206 as the value of A(1%, 1 cm) at the maximum at 316 nm.

Mercaptopurine Oral Suspension

General Notices

NOTE: There are currently no licensed formulations in the United Kingdom.

Action and use

Thiopurine cytotoxic.

DEFINITION

Mercaptopurine Oral Suspension is a suspension of Mercaptopurine in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of mercaptopurine, $C_5H_4N_4S,H_2O$

90.0 to 110.0% of the stated amount.

Shake the oral suspension vigorously before carrying out the following tests.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing 50 mg of Mercaptopurine with a mixture of 20 ml of *water* and 0.5 ml of 5M *sodium hydroxide* for not more than 5 minutes, add sufficient *water* to produce 100 ml, mix and filter. Dilute a portion of the filtrate with sufficient 0.1M *hydrochloric acid* to give a final concentration of 0.0005% w/v of Mercaptopurine. The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum at 325 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 6.0, Appendix V L.

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions, using 900 ml of 0.1M h*ydrochloric acid* as the dissolution medium and rotating the paddle at 50 revolutions per minute. Use a volume of the oral suspension containing one dose.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 10 ml of a mixture of equal volumes of *methanol* and *water* to a weighed quantity of the oral suspension containing 15 mg of Mercaptopurine, mix with the aid of ultrasound for

15 minutes, shake for 1 hour and add sufficient of the mixture of equal volumes of *methanol* and *water* to produce 100 ml.

(2) 0.015% w/v of *mercaptopurine BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with *end-capped base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS 5 µm is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 328 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *water* containing 0.1% w/v of *sodium heptanesulphonate monohydrate* and 0.3% w/v of *sulphuric acid*.

DETERMINATION OF CONTENT

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_5H_4N_4S,H_2O$, weight in volume, using the declared content of $C_5H_4N_4S,H_2O$ in *mercaptopurine BPCRS*.

STORAGE

Mercaptopurine Oral Suspension should be protected from light.

Mercaptopurine Tablets

General Notices

Action and use

Thiopurine cytotoxic.

DEFINITION

Mercaptopurine Tablets contain Mercaptopurine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mercaptopurine, $C_5H_4N_4S,H_2O$

90.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 50 mg of Mercaptopurine with 20 ml of *absolute ethanol*, filter and evaporate to dryness under reduced pressure. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of mercaptopurine *(RS 426)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using the following conditions.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 0.1M *hydrochloric acid* as the dissolution medium at a temperature of 37°.

Withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium, if necessary, at the maximum at 325 nm using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *mercaptopurine BPCRS* in the dissolution medium using the declared content of $C_5H_4N_4S,H_2O$ in *mercaptopurine BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add a quantity of the powdered tablets containing 0.25 g of Mercaptopurine to 80 ml of 0.02M *methanolic sodium hydroxide* in a 100 ml volumetric flask, mix with the aid of ultrasound for 10 minutes, dilute to 100 ml and filter through a GF/F filter (Whatman Autotop

is suitable). Dilute 1 volume of the resulting solution to 20 volumes with 0.1% v/v of *anhydrous formic acid* .

(2) Dilute 1 volume of solution (1) to 100 volumes with 0.1% w/v of *anhydrous formic acid* and further dilute 1 volume of the resulting solution to 10 volumes with 0.1% w/v of *anhydrous formic acid* .

(3) 0.025% w/v of *hypoxanthine* in 0.02M *methanolic sodium hydroxide* diluted to 0.00025% w/v with 0.1% v/v of *anhydrous formic acid* .

(4) 0.03% w/v of *bis-(1,7-dihydro-6*H*-purine)-6,6-disulphide BPCRS* in 0.02M *methanolic sodium hydroxide* and dilute to 0.0003% w/v with 0.1% v/v of *anhydrous formic acid* .

(5) Dissolve 25 mg of *mercaptopurine impurity standard BPCRS* in 10 ml of 0.02M *methanolic sodium hydroxide.* Dilute 1 volume to 50 volumes with 0.1% v/v of *anhydrous formic acid* .

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *polar endcapped ether linked phenyl groups* (4 µm) (Phenomenex Synergi Polar RP is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use ambient column temperature.

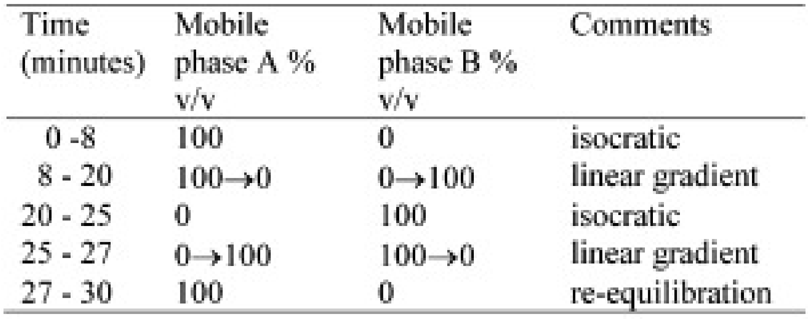
(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µl of each solution and prepare the samples immediately before injection.

MOBILE PHASE

Mobile phase A 2 volumes of *methanol* and 98 volumes of 0.1% v/v of *anhydrous formic acid* .

Mobile phase B 50 volumes of *methanol* and 50 volumes of 0.1% v/v of *anhydrous formic acid* .



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comments
0 -8	100	0	isocratic
8 - 20	100→0	0→100	linear gradient
20 - 25	0	100	isocratic
25 - 27	0→100	100→0	linear gradient
27 - 30	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless there is baseline resolution between the principal peaks corresponding to thioguanine, hypoxanthine and adenine in the chromatogram obtained with solution (5).

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to hypoxanthine is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2.0%);

— the area of any peak corresponding to bis-(1,7-dihydro-6*H*-purine)-6,6-disulphide is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (2.5%);

— the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add a quantity of the powdered tablets, containing 50 mg of Mercaptopurine in 100 ml of 0.02M *methanolic sodium hydroxide*, mix with the aid of ultrasound for 10 minutes and filter through a GF/F filter (Whatman Autotop is suitable). Dilute 1 volume to 20 volumes with 0.1% v/v *anhydrous formic acid*.

(2) 0.50% w/v of *mercaptopurine BPCRS* in 0.02M *methanolic sodium hydroxide* diluted to 0.0025% w/v with 0.1% v/v of *anhydrous formic acid*.

(3) Dissolve 25 mg of *mercaptopurine impurity standard BPCRS* in 10 ml of 0.02M *methanolic sodium hydroxide*. Dilute 1 volume to 50 volumes with 0.1% v/v of *anhydrous formic acid*. The chromatographic procedure described under Related substances may be used.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but with isocratic elution and the mobile phase described below.

MOBILE PHASE

2 volumes of *methanol* and 98 volumes of 0.1% v/v of *anhydrous formic acid*.

SYSTEM SUITABILITY

The test is not valid unless there is baseline resolution between the principal peaks corresponding to thioguanine, hypoxanthine and adenine in the chromatogram obtained with solution (5).

DETERMINATION OF CONTENT

Calculate the total content of mercaptopurine, $C_5H_4N_4S$,H2O, in the tablets using the chromatogram obtained and the declared content of $C_5H_4N_4S,H_2O$ in *mercaptopurine BPCRS*.

STORAGE

Mercaptopurine Tablets should be protected from light.

Metaraminol Injection

General Notices

Action and use

Adrenoceptor agonist.

DEFINITION

Metaraminol Injection is a sterile solution of Metaraminol Tartrate in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of metaraminol, $C_9H_{13}NO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (5).

B. Dilute a volume containing the equivalent of 5 mg of metaraminol to 10 ml with *water* and extract with four 15 ml quantities of *chloroform*. To 0.5 ml of the aqueous layer add 0.5 ml of *phosphomolybdotungstic reagent* and 5 ml of *dilute sodium carbonate solution* and allow to stand for 5 minutes. An intense blue colour is produced.

C. To 4 ml of the aqueous layer obtained in test B add 5 ml of *borate buffer pH 9.6* and 1 ml of a freshly prepared 0.5% w/v solution of *sodium 1,2-naphthoquinone-4-sulphonate* and allow to stand for 1 minute. Add 0.2 ml of a 2% v/v solution of *benzalkonium chloride solution* and 5 ml of *toluene* and shake. A mauve colour is produced immediately in the toluene layer (distinction from phenylephrine).

TESTS

Acidity

pH, 3.2 to 4.5, Appendix V L.

Related substances

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 10 volumes of 13.5M *ammonia*, 80 volumes of *chloroform* and 80 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) evaporate a volume of the injection containing the equivalent of 20 mg of metaraminol to dryness, dissolve the residue as completely as possible in 2 ml of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 20 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *methanol*. Solution (4) contains 0.1% w/v of *methyl 4-hydroxybenzoate* in *methanol*. Solution (5) contains 0.050% w/v of *metaraminol tartrate BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and spray with a solution prepared in the following manner. Mix 25 ml of a 0.45% w/v solution of *sulphanilic acid* in 1M *hydrochloric acid* with 1.5 ml of a 5% w/v solution of *sodium nitrite*, allow to stand for 5 minutes and mix cautiously with 25 ml of 2M *sodium carbonate*. Any *secondary spot* in the chromatogram obtained with solution (1), other than any spot corresponding to methyl 4-hydroxybenzoate, is not more intense than the spot in the chromatogram obtained with solution (3) (1%).

ASSAY

To a quantity containing the equivalent of 10 mg of metaraminol add sufficient *water* to produce 200 ml. Wash 25 ml with four 25 ml quantities of *chloroform*, discard the washings and filter the aqueous solution. Measure the *absorbance* of the filtrate at the maximum at 272 nm, Appendix II B. Calculate the content of $C_9H_{13}NO_2$ taking 111 as the value of A(1%, 1 cm) at the maximum at 272 nm.

STORAGE

Metaraminol Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of metaraminol in a suitable dose-volume.

Metformin Tablets

General Notices

Action and use

Biguanide; treatment of diabetes mellitus.

DEFINITION

Metformin Tablets contain Metformin Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of metformin hydrochloride, $C_4H_{11}N_5$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 20 mg of Metformin Hydrochloride with 20 ml of *absolute ethanol* , filter, evaporate the filtrate to dryness on a water bath and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metformin hydrochloride (*RS 217*).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of a 0.68% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 6.8 by the addition of 1M *sodium hydroxide* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Filter, dilute 10 ml of the filtrate to 100 ml with *water* and dilute 10 ml of the resulting solution to 100 ml with *water*. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 233 nm, Appendix II B. Calculate the total content of metformin hydrochloride, $C_4H_{11}N_5$,HCl, in the medium taking 806 as the value of *A* (1%, 1 cm) at the maximum at 233 nm.

1-Cyanoguanidine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.50 g of Metformin Hydrochloride with 100 ml of the mobile phase, filter and use the filtrate. For solution (2) dissolve 20 mg of *1-cyanoguanidine* in *water*, dilute to 100 ml with *water* and dilute 1 ml of the resulting solution to 200 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with a regular, porous silica gel to which benzene sulphonic acid groups have been chemically bonded (5 µm) (Partisphere 5 µ SCX is suitable), (b) a 1.7% w/v solution of *ammonium dihydrogen orthophosphate* adjusted to pH 3.0 with *orthophosphoric* *acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 218 nm.

Inject 20 µl of solution (2). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is not less 50% of the full scale of the recorder.

Inject separately 20 µl of solutions (1) and (2). In the chromatogram obtained with solution (1) the area of any peak corresponding to 1-cyanoguanidine is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of Metformin Hydrochloride with 70 ml of *water* for 15 minutes, dilute to 100 ml with *water* and filter, discarding the first 20 ml. Dilute 10 ml of the filtrate to 100 ml with *water* and dilute 10 ml of the resulting solution to 100 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 232 nm, Appendix II B. Calculate the content of the $C_4H_{11}N_5$,HCl taking 798 as the value of A(1%, 1 cm) at the maximum at 232 nm.

Methadone Linctus

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Methadone Linctus is an *oral solution* containing 0.04% w/v of Methadone Hydrochloride in a suitable vehicle with a tolu flavour.

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of methadone hydrochloride, $C_{21}H_{27}NO,HCl$

0.036 to 0.044% w/v.

IDENTIFICATION

To 50 ml add 30 ml of *water* and add 1M *sulphuric acid* until the solution is acidic to *litmus paper*. Extract with two 20 ml quantities of *petroleum spirit (boiling range, 40° to 60°)*, discarding the extracts, and add 5M *sodium hydroxide* until the solution is alkaline to *litmus paper*. Add 4 g of *sodium chloride*, shake to dissolve, extract with two 25 ml quantities of *ether* and wash the combined ether extracts with five 20 ml quantities of *water*. Dry with *anhydrous sodium sulphate*, filter, evaporate to dryness and dry the residue over *phosphorus pentoxide* at a pressure of 2 kPa. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of methadone *(RS 218)*.

B. To 5 mg add 0.05 ml of *dinitrobenzene solution* and 0.05 ml of a 50% w/v solution of *sodium hydroxide*. A purple colour is produced which changes slowly to dark brown.

ASSAY

To 30 g add 1 ml of *glacial acetic acid* and dilute to 100 ml with *water*. To 10 ml of the resulting solution add 10 ml of a 0.4% w/v solution of *picric acid* and 10 ml of *phosphate buffer pH 4.9*, extract with three 15 ml quantities of *chloroform* and dilute the combined chloroform extracts to 50 ml with *chloroform*. To 10 ml add sufficient *chloroform* to produce 20 ml and measure the *absorbance* of the resulting solution, Appendix II B, at the maximum at 350 nm using in the reference cell a solution prepared in the same manner but using 10 ml of a 1% v/v solution of *glacial acetic acid* and beginning at the words 'add 10 ml…'. Calculate the content of $C_{21}H_{27}NO,HCl$ taking 448 as the value of *A* (1%, 1 cm) at the maximum at 350 nm. Determine the *weight per ml*, Appendix V G, and calculate the content of $C_{21}H_{27}NO,HCl$, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Methadone Oral Solution (1 mg per ml)

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Methadone Oral Solution (1 mg per ml) contains 0.1% w/v of Methadone Hydrochloride in a suitable aqueous vehicle. It is supplied as a ready-to-use solution or it is prepared from Methadone Hydrochloride Oral Concentrate in accordance with the manufacturer's instructions.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of methadone hydrochloride, $C_{21}H_{27}NO,HCl$

0.090 to 0.110 % w/v.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel plates are suitable) and a mixture of 1.5 volumes of *concentrated ammonia R1* and 100 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add to 50 ml of the oral solution 30 ml of *water* and sufficient 1M *sulphuric acid* to make the solution acid to *litmus paper*. Extract with two 20 ml quantities of *petroleum spirit* (*boiling range, 40° to 60°),* discarding the extracts. Make the solution alkaline to *litmus paper* with 5M *sodium hydroxide*, add 4 g of *sodium chloride*, shake to dissolve, extract with two 25 ml quantities of *ether* and wash the combined extracts with five 20 ml quantities of *water*. Shake the ether extract with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at a pressure of 2 kPa. Prepare a solution containing 0.5% w/v of the residue in *ethanol (96%)*. Solution (2) contains 0.55% w/v of *methadone hydrochloride BPCRS* in *ethanol (96%).* After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 1 volume of the oral solution to 10 volumes with the mobile phase. Solution (2) contains 0.01% w/v of *methadone hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm

× 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 10µ is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 50 volumes of *acetonitrile* and 50 volumes of 0.02M *potassium dihydrogen orthophosphate*, the mixture adjusted to pH 5.5 with 2M *orthophosphoric acid* or 2M *sodium hydroxide* and (c) a detection wavelength of 220 nm.

Calculate the content of $C_{21}H_{27}NO,HCl$ in the oral solution from the chromatograms obtained and using the declared content of $C_{21}H_{27}NO,HCl$ in *methadone hydrochloride BPCRS*.

METHADONE HYDROCHLORIDE ORAL CONCENTRATE

DEFINITION

Methadone Hydrochloride Oral Concentrate is a solution of Methadone Hydrochloride in a suitable aqueous vehicle.

The concentrate complies with the requirements stated under Oral Liquids and with the following requirements.

Content of methadone hydrochloride, $C_{21}H_{27}NO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel plates are suitable) and a mixture of 1.5 volumes of *concentrated ammonia R1* and 100 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add to 5 ml of the oral concentrate 30 ml of *water* and sufficient 1M *sulphuric acid* to make the solution acid to *litmus paper*. Extract with two 20 ml quantities of *petroleum spirit* (*boiling range, 40° to 60°),* discarding the extracts. Make the solution alkaline to *litmus paper* with 5M *sodium hydroxide*, add 4 g of *sodium chloride*, shake to dissolve, extract with two 25 ml quantities of *ether* and wash the combined extracts with five 20 ml quantities of *water*. Shake the ether extract with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at a pressure of 2 kPa. Prepare a solution containing 0.5% w/v of the residue in *ethanol (96%)*. Solution (2) contains 0.55% w/v of *methadone hydrochloride BPCRS* in *ethanol (96%).* After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the concentrate with the mobile phase to produce a solution containing 0.01% w/v of Methadone Hydrochloride. Solution (2) contains 0.01% w/v of *methadone hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 10µ is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 50 volumes of *acetonitrile* and 50 volumes of 0.02M *potassium dihydrogen orthophosphate*, the mixture adjusted to pH 5.5 with 2M *orthophosphoric acid* or 2M *sodium hydroxide* and (c) a detection wavelength of 220 nm.

Calculate the content of $C_{21}H_{27}NO,HCl$ in the concentrate from the chromatograms obtained and using the declared content of $C_{21}H_{27}NO,HCl$ in *methadone hydrochloride BPCRS*.

LABELLING

The label states the directions for use of the concentrate.

At the specific request of the prescriber, the concentrate may be diluted to a concentration other than 0.1% w/v in accordance with the manufacturer's instructions.

Methadone Tablets

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Methadone Tablets contain Methadone Hydrochloride.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of methadone hydrochloride, $C_{21}H_{27}NO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Methadone Hydrochloride with 20 ml of *water* and centrifuge. Make the supernatant liquid alkaline with 5M *sodium hydroxide*, stir with a glass rod until the precipitate solidifies, filter, wash with *water* and dry over *phosphorus pentoxide* at room temperature at a pressure of 2 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of methadone *(RS 218)*.

B. Extract a quantity of the powdered tablets containing 0.1 g of Methadone Hydrochloride with 10 ml of *water*, filter and wash the residue with sufficient *water* to bring the volume of the filtrate to 10 ml. Add to the filtrate 0.125 g of *picrolonic acid* dissolved in 50 ml of boiling *water*, stir and allow to stand for 2 hours. The *melting point* of the residue, after recrystallisation from *ethanol (20%)*, washing with *ethanol (20%)* and drying at 105°, is about 160° or about 180°, Appendix V A.

C. Extract a quantity of the powdered tablets containing 5 mg of Methadone Hydrochloride with 5 ml of *ethanol (96%)*, filter and evaporate the filtrate to dryness. To the residue add 0.05 ml of *dinitrobenzene solution* and 0.05 ml of a 50% w/v solution of *sodium hydroxide*. A purple colour is produced which changes slowly to dark brown.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 50 mg of Methadone Hydrochloride add 60 ml of *water* and 5 ml of *glacial acetic acid*, heat on a water bath for 5 minutes, mix with the aid of ultrasound for 10 minutes and dilute to 100 ml with water. Filter through a glass fibre paper, discarding the first 10 ml of filtrate, and dilute 20 ml to 100 ml with *water*. To 10 ml of the resulting solution add 10 ml of *phosphate buffer pH 4.9* and 5 ml of a 0.4% w/v solution of *picric acid*. Extract with three 15 ml quantities of *chloroform* and dilute the combined chloroform extracts to 50 ml with *chloroform*. To 10 ml add sufficient *chloroform* to produce 20 ml and measure the *absorbance* of the resulting solution, Appendix II B, at the maximum at 350 nm using in the reference cell a solution prepared in the same manner but using a 5% v/v solution of *glacial acetic acid* and beginning at the words 'Filter through a glass fibre paper…'. Calculate the content of $C_{21}H_{27}NO,HCl$ taking 448 as the value of *A* (1%, 1 cm) at the maximum at 350 nm.

Methotrexate Injection

General Notices

Action and use

Dihydrofolate reductase inhibitor; cytostatic.

DEFINITION

Methotrexate Injection is a sterile solution of Methotrexate in Water for Injections containing Sodium Hydroxide.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of methotrexate, $C_{20}H_{22}N_8O_5$

95.0 to 110.0% of the stated amount.

CHARACTERISTICS

A yellowish solution.

IDENTIFICATION

A. Dilute a suitable volume of the injection with 0.1M *sodium hydroxide* to produce a solution containing 0.001% w/v of Methotrexate. The *light absorption* of the resulting solution, Appendix II B, exhibits three maxima, at 258 nm, 303 nm and 371 nm.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

TESTS

Alkalinity

pH, 7.0 to 9.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the injection, if necessary, to produce a solution containing 0.01% w/v of Methotrexate.

(2) 0.00002% w/v of *methotrexate EPCRS.*

(3) 0.0003% w/v of *methotrexate impurity C EPCRS*.

(4) 0.0003% w/v each of *methotrexate EPCRS* and *methotrexate impurity D EPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS 5 µm is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µl of each solution.

(g) Continue the chromatography for three times the retention time of methotrexate.

MOBILE PHASE

7 volumes of *acetonitrile* and 93 volumes of a citro-phosphate buffer solution prepared by dissolving 7.8 g of *citric acid* and 17.9 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to methotrexate and methotrexate impurity D is at least 2.0.

LIMITS

The approximate retention times relative to methotrexate are: impurity A, 0.2; impurity B, 0.3; impurity C, 0.4; impurity D, 0.8; impurity E, 2.3.

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to impurity C is not greater that the area of the principal peak in the chromatogram obtained with solution (3) (3%);

— the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the injection, if necessary, to produce a solution containing 0.01% w/v of Methotrexate.

(2) 0.01% w/v of *methotrexate EPCRS.*

(3) 0.01% w/v each of the substance being examined and *methotrexate impurity D EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but using 302 nm as the detection wavelength.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to methotrexate and methotrexate impurity D is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{22}N_8O_5$ in the injection using the declared content of $C_{20}H_{22}N_8O_5$ in *methotrexate EPCRS*.

STORAGE

Methotrexate Injection should be protected from light.

LABELLING

When an antimicrobial preservative is present the label states that the contents are not intended for intrathecal injection.

Methotrexate Tablets

General Notices

Action and use

Dihydrofolate reductase inhibitor; cytostatic.

DEFINITION

Methotrexate Tablets contain Methotrexate or methotrexate sodium prepared by the interaction of Methotrexate with Sodium Hydroxide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of methotrexate, $C_{20}H_{22}N_8O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 10 mg of Methotrexate with sufficient 0.1M *sodium hydroxide* to produce 100 ml, filter and dilute 10 ml of the filtrate to 100 ml with 0.1M *sodium hydroxide*. The *light absorption* of the resulting solution, Appendix II B in the range 230 to 400 nm, exhibits three maxima, at 258, 303 and 371 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Disintegration

Maximum time, 30 minutes, Appendix XII A1.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 ml of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 ml sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 303 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *methotrexate EPCRS* in the dissolution

medium using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of methotrexate, $C_{20}H_{22}N_8O_5$, in the medium from the *absorbances* obtained and from the declared content of $C_{20}H_{22}N_8O_5$ in *methotrexate EPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the powdered tablets containing 10 mg of Methotrexate in 70 ml with the aid of ultrasound for 5 minutes and dilute to 100 ml. Mix and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.00002% w/v of *methotrexate EPCRS.*

(3) 0.0003% w/v of *methotrexate impurity C EPCRS*.

(4) 0.0003% w/v each of *methotrexate EPCRS* and *methotrexate impurity D EPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS 5 µm is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 265 nm.

(f) Inject 20 µl of each solution.

(g) Continue the chromatography for three times the retention time of methotrexate.

MOBILE PHASE

7 volumes of *acetonitrile* and 93 volumes of a citro-phosphate buffer solution prepared by dissolving 7.8 g of *citric acid* and 17.9 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to methotrexate and methotrexate impurity D is at least 2.0.

LIMITS

The approximate retention times relative to methotrexate are: impurity A, 0.2; impurity B, 0.3; impurity C, 0.4; impurity D, 0.8; impurity E, 2.3.

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to impurity C is not greater that the area of the principal peak in the chromatogram obtained with solution (3) (3%);

— the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— the sum of the areas of any other *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the powdered tablets containing 10 mg of Methotrexate in 70 ml with the aid of ultrasound for 5 minutes and dilute to 100 ml. Mix and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.01% w/v of *methotrexate EPCRS.*

(3) 0.01% w/v each of *methotrexate EPCRS* and *methotrexate impurity D EPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but using 302 nm as the detection wavelength.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to methotrexate and methotrexate impurity D is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{22}N_8O_5$ in the tablets using the declared content of $C_{20}H_{22}N_8O_5$ in *methotrexate EPCRS*.

STORAGE

Methotrexate Tablets should be protected from light.

LABELLING

When the active ingredient is methotrexate sodium, the quantity is expressed in terms of the equivalent amount of Methotrexate.

Methoxamine Injection

General Notices

Action and use

Adrenoceptor agonist.

DEFINITION

Methoxamine Injection is a sterile solution containing 2% w/v of Methoxamine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of methoxamine hydrochloride, $C_{11}H_{17}NO_3$,HCl

1.90 to 2.10% w/v.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. The *light absorption* of the solution obtained in the Assay, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 290 nm.

B. Dilute 1 ml with 1 ml of *water*, add 5 ml of *diazotised nitroaniline solution* and 1 ml of *dilute sodium carbonate solution*, allow to stand for 2 minutes and add 1 ml of 1M *sodium hydroxide*. A deep red colour is produced which is extractable with *butan-1-ol*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 86 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) use the injection being examined. Solution (2) contains 0.010% w/v of *2,5-dimethoxybenzaldehyde* in *methanol*. For solution (3) dilute 1 volume of the injection to 100 volumes with *water*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (365 nm)*. Any spot corresponding to 2,5-dimethoxybenzaldehyde in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Spray the plate with a 0.3% w/v solution of *ninhydrin* in *butan-1-ol* containing 3% v/v of *glacial acetic acid* and heat at 105° for 5 minutes. Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Dilute 1 ml to 100 ml with *water*, further dilute 20 ml of this solution to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B. Calculate the content of $C_{11}H_{17}NO_3$,HCl taking 137 as the value of A(1%, 1 cm) at the

maximum at 290 nm.

Methyl Salicylate Liniment

General Notices

DEFINITION

Methyl Salicylate is a *cutaneous emulsion*. It contains 25% v/v of Methyl Salicylate in Arachis Oil or other suitable fixed oil.

The liniment complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of methyl salicylate, $C_8H_8O_3$

23.0 to 26.5% v/v.

CHARACTERISTICS

The liniment has a characteristic odour.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as that due to methyl salicylate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using three solutions in *petroleum spirit (boiling range, 80° to 100°)* containing (1) 1% w/v of *benzyl alcohol* (internal standard) and 1% w/v of *methyl salicylate*, (2) 4% w/v of the liniment and (3) 4% w/v of the liniment and 1% w/v of the internal standard.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *diatomaceous support* (60 to 80 mesh) coated with 10% w/w of polyethylene glycol 1540 and maintained at 110°.

Determine the *weight per ml* of the liniment, Appendix V G, and calculate the content of $C_8H_8O_3$, volume in volume, taking the content of $C_8H_8O_3$ in *methyl salicylate* to be 100.0% and its *weight per ml* to be 1.18 g.

LABELLING

The label indicates the pharmaceutical form as 'cutaneous emulsion'.

Methyl Salicylate Ointment

General Notices

Strong Methyl Salicylate Ointment

DEFINITION

Methyl Salicylate Ointment contains 50% w/w of Methyl Salicylate in a suitable water-emulsifying basis.

Extemporaneous preparation

The following formula and directions apply.

Methyl Salicylate	500 g
White Beeswax	250 g
Hydrous Wool Fat	250 g

Melt together the White Beeswax and the Hydrous Wool Fat, cool, add the Methyl Salicylate and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of methyl salicylate, $C_8H_8O_3$

45.0 to 52.5% w/w.

CHARACTERISTICS

The ointment has a characteristic odour.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as that due to methyl salicylate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using three solutions in *petroleum spirit (boiling range, 80° to 100°)* containing (1) 1% w/v of *benzyl alcohol* (internal standard) and 1% w/v of *methyl salicylate*, (2) 2% w/v of the ointment and (3) 2% w/v of the ointment and 1% w/v of the internal standard.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *diatomaceous support* (60 to 80 mesh) coated with 10% w/w of polyethylene glycol 1540 and maintained at 110°.

Calculate the content of $C_8H_8O_3$ taking 100.0% as the content of $C_8H_8O_3$ in *methyl salicylate*.

STORAGE

Certain plastic containers, such as those made from polystyrene, are unsuitable for Methyl Salicylate Ointment.

Methylcellulose Granules

General Notices

DEFINITION

Methylcellulose	64 g
Amaranth, food grade of commerce	20 mg
Saccharin Sodium	100 mg
Vanillin	200 mg
Acacia	4 g
Lactose	Sufficient to produce 100 g

Extemporaneous preparation

The following directions apply.

Mix the ingredients, in powder, add sufficient Water to form a coherent mass suitable for granulation, pass the mass through a sieve with a nominal mesh aperture of 2.8 mm, place the granules on a sieve with a nominal mesh aperture of 710 µm, discard the material passing through the sieve and dry the granules at a temperature not exceeding 60°.

The granules comply with the requirements stated under Granules and with the following requirements.

TESTS

Kinematic viscosity of aqueous solution

Not less than 2000 $mm^2 s^{-1}$ when determined by the following method. To 3.25 g in a wide-necked bottle add 100 ml of *water* previously heated to 85° to 90°, close the bottle with a device fitted with a stirrer, stir for 10 minutes, place the bottle in ice, continue stirring until the solution is of uniform consistency, remove the bottle from the ice and allow the solution to attain ambient temperature. Determine the *kinematic viscosity* of the solution, Appendix V H, Method II, using a suspended-level viscometer (size 4).

STORAGE

Methylcellulose Granules should be kept in a wide-mouthed, airtight container.

Methylcellulose Tablets

General Notices

DEFINITION

Methylcellulose Tablets contain Methylcellulose 450 in a suitable flavoured basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

IDENTIFICATION

A. Whilst stirring, introduce a quantity of the powdered tablets containing 1.0 g of Methylcellulose 450 into 50 ml of *carbon dioxide-free water* heated at 90°. Allow to cool, dilute to 100 ml with the same solvent and continue stirring until solution is complete (solution A). Heat 10 ml of solution A in a water bath, with stirring. At temperatures above 50° either the solution becomes cloudy or a flocculent precipitate is produced. The solution becomes clear on cooling.

B. Mix thoroughly a quantity of the powdered tablets containing 1 g of Methylcellulose 450 with 2 g of finely powdered *manganese(II) sulphate* in a test-tube about 16 cm long. Impregnate a strip of filter paper with a freshly prepared mixture of 1 volume of a 20% v/v solution of *diethanolamine* and 11 volumes of a 5% w/v solution of *sodium nitroprusside* adjusted to pH 9.8 with 1M *hydrochloric acid*. Insert the strip to a depth of 2 cm into the upper part of the tube, immerse the tube to a depth of 8 cm in a silicone oil bath and heat at 190° to 200°. The filter paper does not become blue within 10 minutes. Carry out a blank test.

TESTS

Kinematic viscosity

For tablets containing 500 mg of Methylcellulose 450, at 20°, 350 to 550 $mm^2 s^{-1}$, when determined by the following method. Place 2.6 g of the powdered tablets in a wide-mouthed bottle, add 100 ml of *water* heated to 85° to 90°, close the bottle with a stopper fitted with a stirrer and stir for 10 minutes. Cool in ice and continue stirring until the solution is of uniform consistence. Remove the ice and allow the solution to attain room temperature. Determine the *kinematic viscosity* of the solution, Appendix V H, Method II, using a suspended-level viscometer (size 3).

Disintegration

The requirement for Disintegration does not apply to Methylcellulose Tablets.

LABELLING

The label states that the tablets should be broken in the mouth before swallowing.

Methyldopa Tablets

General Notices

Action and use

Alpha$_2$-adrenoceptor agonist; treatment of hypertension.

DEFINITION

Methyldopa Tablets contain Methyldopa. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous methyldopa, $C_{10}H_{13}NO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Remove the coating from a suitable number of tablets by washing with *chloroform*. To a quantity of the powdered tablet cores containing the equivalent of 5 g of anhydrous methyldopa add 35 ml of a mixture of equal volumes of *chloroform* and *methanol* and shake for 3 minutes. Centrifuge and discard the supernatant liquid. Repeat the operation with a further 35 ml of a mixture of equal volumes of *chloroform* and *methanol*. Dry the residue in a current of nitrogen, add 20 ml of *methanol* and 15 ml of 2M *hydrochloric acid*, shake for 2 minutes and filter. Adjust the pH of the filtrate to 4.9 with 5M *ammonia*, allow to stand for several hours at 2° to 8° and filter. Wash the precipitate with 15 ml of *water* and dry it at 50° at a pressure not exceeding 0.7 kPa for 3 hours. Reserve a portion of the residue for the test for Optical rotation. The remainder of the residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of methyldopa *(RS 223)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *microcrystalline cellulose* as the coating substance and a mixture of 50 volumes of *butan-1-ol*, 25 volumes of *glacial acetic acid* and 25 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of two solutions in 1M *hydrochloric acid* containing (1) 1% w/v of the residue and (2) 1% w/v of *methyldopa BPCRS*. After removal of the plate, dry it in a current of warm air and spray with a freshly prepared mixture of equal volumes of a 10% w/v solution of *iron(III) chloride hexahydrate* and a 5% w/v solution of *potassium hexacyanoferrate(III)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Add 0.1 ml of *iron(III) chloride solution R1* to 5 ml of a 0.4% w/v solution in 0.1M *hydrochloric acid*; a green colour is produced. To half of the solution add an excess of 5M *ammonia*; a purple colour is produced. To the remainder of the solution add an excess of 5M *sodium hydroxide*; a red colour is produced.

Optical rotation

Determine the content of $C_{10}H_{13}NO_4$ in the residue reserved in the test for Identification by carrying out Method I for *non-aqueous titration*, Appendix VIII A, using 0.2 g of the residue and *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 21.12 mg of $C_{10}H_{13}NO_4$. Dissolve a quantity of the residue containing 0.39 g of $C_{10}H_{13}NO_4$ in sufficient *aluminium chloride solution* to produce 10 ml. The *optical rotation* of the resulting solution at 25° is –0.98° to –1.09°, Appendix V F.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing the equivalent of 0.1 g of anhydrous methyldopa as completely as possible in sufficient 0.05M *sulphuric acid* to produce 100 ml and filter. To 5 ml of the filtrate add 2 ml of *iron(II) sulphate–citrate solution*, 8 ml of *glycine buffer solution* and sufficient *water* to produce 100 ml. Measure the *absorbance* of the resulting solution at the maximum at 545 nm, Appendix II B. Repeat the procedure using 5 ml of a 0.10% w/v solution of *methyldopa BPCRS* in place of 5 ml of the filtrate, beginning at the words 'add 2 ml of…'. Calculate the content of $C_{10}H_{13}NO_4$ using the declared content of $C_{10}H_{13}NO_4$ in *methyldopa BPCRS*.

STORAGE

Methyldopa Tablets should be protected from light.

LABELLING

The quantity of active ingredient is expressed in terms of the equivalent amount of anhydrous methyldopa.

Methyldopate Injection

General Notices

Action and use

Alpha$_2$-adrenoceptor agonist; treatment of hypertension.

DEFINITION

Methyldopate Injection is a sterile solution prepared by dissolving Methyldopate Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of methyldopate hydrochloride and methyldopa calculated as $C_{12}H_{17}NO_4$,HCl

The equivalent of 92.5 to 107.5% of the stated amount of Methyldopate Hydrochloride.

IDENTIFICATION

A. Dilute with 0.1M *hydrochloric acid* to produce a solution containing 0.004% w/v of Methyldopate Hydrochloride. The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum only at 280 nm.

B. Dilute with 0.1M *hydrochloric acid* to produce a solution containing 2% w/v of Methyldopate Hydrochloride. The *optical rotation* of the resulting solution, measured at 25° in a 2-dm tube, is –0.28° to –0.35°, Appendix V F.

C. Yields reaction A characteristic *of chlorides*, Appendix VI.

TESTS

Acidity

pH, 3.0 to 4.2, Appendix V L.

Methyldopa

Not more than 10% of the declared content of Methyldopate Hydrochloride when determined as described in the Assay and calculated as $C_{12}H_{17}NO_4$,HCl.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.1% w/v of *methyldopate hydrochloride BPCRS* and 0.01% w/v of *methyldopa BPCRS* in the mobile phase. For solution (2) dilute a volume of the injection being examined with the mobile phase to contain 0.1% w/v of Methyldopate Hydrochloride.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) a 0.3% w/v solution of *sodium dihydrogen orthophosphate* in a mixture of 155 volumes of *water* and 45 volumes of *methanol*, the mixture containing 0.1% v/v of *orthophosphoric acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 280 nm.

Determine the content of methyldopa, expressed as methyldopate hydrochloride, $C_{12}H_{17}NO_4$,HCl, using the declared content of $C_{10}H_{13}NO_4$ in *methyldopa BPCRS* and taking each mg of $C_{10}H_{13}NO_4$ as equivalent to 1.305 mg of $C_{12}H_{17}NO_4$,HCl. Determine the content of $C_{12}H_{17}NO_4$,HCl from the declared content of $C_{12}H_{17}NO_4$,HCl in *methyldopate hydrochloride BPCRS*. Calculate the total content of methyldopate hydrochloride and methyldopa as $C_{12}H_{17}NO_4$,HCl as the sum of the two determinations.

STORAGE

Methyldopate Injection should be protected from light.

Methylphenobarbital Tablets

General Notices

Action and use

Barbiturate.

DEFINITION

Methylphenobarbital Tablets contain Methylphenobarbital.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of methylphenobarbital, $C_{13}H_{14}N_2O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Transfer a quantity of the finely powdered tablets containing 0.20 g of Methylphenobarbital to a long-stemmed, sintered glass filter (ISO 4793, porosity grade 3, is suitable), wash with 15 ml of *petroleum ether (boiling range 40° to 60°)*, stir for 2 to 3 minutes and filter; repeat the extraction with two 15 ml quantities of *petroleum ether (boiling range 40° to 60°)*. Discard the filtrates, extract the residues with two 15 ml quantities of *dichloromethane*, combine the extracts, evaporate to dryness on a water bath and dry the residue at 105° for 30 minutes to 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of methylphenobarbital *(RS 388)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2 and rotating the paddle at 75 revolutions per minute. Use as the medium 900 ml of a borate buffer of pH 10.0 prepared by dissolving 3.093 g of *boric acid*, 3.730 g of *potassium chloride* and 1.75 g of *sodium hydroxide* in 200 ml of *water* and diluting the solution to 1000 ml with *water*. Withdraw a sample of 20 ml of the medium and filter. Dilute the filtrate, if necessary, with the dissolution medium to give a solution expected to contain about 0.002% w/v of Methylphenobarbital. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 242 nm using dissolution medium in the reference cell. Calculate the total content of methylphenobarbital, $C_{13}H_{14}N_2O_3$, in the medium from the absorbance obtained from a 0.0020% w/v solution of *methylphenobarbital BPCRS* in dissolution medium and using the declared content of $C_{13}H_{14}N_2O_3$ in *methylphenobarbital BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 120 ml of *methanol* to a quantity of the powdered tablets containing 30 mg of Methylphenobarbital, mix with the aid of ultrasound for 10 minutes, add 50 ml of *water*, cool and dilute to 200 ml with *methanol*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol (75%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with particles of silica 5 µm in diameter the surface of which has been modified with chemically bonded hexyl groups (Spherisorb Hexyl is suitable) and maintained at 40°, (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 55 volumes of 0.045M *disodium hydrogen orthophosphate* adjusted to pH 6.5 with *orthophosphoric acid* and 45 volumes of *methanol*, adjusted to pH 6.0 with *orthophosphoric acid* and (c) a detection wavelength of 235 nm.

Inject 20 µl of each solution. In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 120 ml of *methanol* to a quantity of the powdered tablets containing 30 mg of Methylphenobarbital, mix with the aid of ultrasound for 10 minutes, add 50 ml of *water*, cool and dilute to 200 ml with *methanol*. Prepare solution (2) in the same manner as solution (1) but using 30 mg of *methylphenobarbital BPCRS* in place of the powdered tablets.

The chromatographic procedure described under the test for Related substances may be used.

Inject 10 µl of each solution. Calculate the content of $C_{13}H_{14}N_2O_3$ using the declared content of $C_{13}H_{14}N_2O_3$ in *methylphenobarbital BPCRS*.

Methylprednisolone Acetate Injection

General Notices

Action and use

Glucocorticoid.

DEFINITION

Methylprednisolone Acetate Injection is a sterile suspension of Methylprednisolone Acetate in Water for Injections. It is prepared using aseptic technique.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of methylprednisolone acetate, $C_{24}H_{32}O_6$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A white suspension which settles on standing but readily disperses on shaking. On examination under a microscope, the particles are seen to be crystalline and rarely exceed 20 µm in diameter.

IDENTIFICATION

Dilute a volume containing 0.1 g of Methylprednisolone Acetate to 5 ml with *water*, centrifuge and discard the supernatant liquid. Wash the residue with five 5 ml quantities of *water*, resuspending the residue in the *water* each time, centrifuging and discarding the washings. The residue, after drying at 105° for 3 hours, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of methylprednisolone acetate *(RS 226)*.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase A*.

TESTS

Acidity or alkalinity

pH, 3.5 to 7.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Mix 0.12 g of *prednisone BPCRS* (internal standard) with 0.6 ml of *glacial acetic acid*, slowly add *chloroform* with the aid of ultrasound, shake to dissolve and dilute with sufficient *chloroform* to produce 20 ml (solution A). For solution (1) add 10 ml of solution A to a quantity of the injection containing 40 mg of Methylprednisolone Acetate, add sufficient *chloroform* to produce 25 ml and shake for 15 minutes or until the aqueous layer is clear; to 4 ml of the chloroform layer, add 30 ml of *chloroform* and 0.4 g of *anhydrous sodium sulphate*, shake for 5 minutes and use the clear solution. For solution (2) dissolve 20 mg of *methylprednisolone acetate BPCRS* in 5 ml of solution A and add sufficient *chloroform* to produce 100 ml.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4 mm) packed with *silica gel for chromatography* (5 to 10 µm), (b) a mixture of 30 volumes of *glacial acetic acid*, 35 volumes of *methanol*, 70 volumes of *tetrahydrofuran*, 475 volumes of water-saturated *1-chloro-butane* and 475 volumes of *1-chlorobutane* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

The assay is not valid unless the *resolution factor* between the peaks due to methylprednisolone acetate and the internal standard is at least 2.5.

Calculate the content of $C_{24}H_{32}O_6$ from the declared content of $C_{24}H_{32}O_6$ in *methylprednisolone acetate BPCRS*.

STORAGE

Methylprednisolone Acetate Injection should be protected from light and stored at a temperature not exceeding 30°. It should not be allowed to freeze.

LABELLING

The label states (1) that the preparation is not to be given by intravenous injection; (2) that the container should be shaken gently before a dose is withdrawn.

Methylprednisolone Tablets

General Notices

Action and use

Glucocorticoid.

DEFINITION

Methylprednisolone Tablets contain Methylprednisolone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of methylprednisolone, $C_{22}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 50 mg with 100 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of methylprednisolone *(RS 225)*.

B. Complies with test B described under Methylprednisolone.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of *water* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 5 ml of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample at the maximum at 256 nm, Appendix II B. Calculate the total content of methylprednisolone, $C_{22}H_{30}O_{5,}$ in the medium taking 400 as the value of *A* (1%, 1 cm) at the maximum at 256 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using as the coating substance a suitable silica gel containing a fluorescent indicator with an optimal intensity at 254 nm and a mixture of 1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Methylprednisolone for 15 minutes with 2 ml of a mixture of 1 volume of *methanol* and 9 volumes of *chloroform*, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of the supernatant liquid to 50 volumes with the same solvent mixture. For solution (3) dilute 1 volume of solution (2) to 4 volumes with the same solvent mixture. For solution (4) dissolve 1 mg of *hydrocortisone* in a mixture of 0.1 ml of solution (1) and 0.9 ml of *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (2%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%). The test is not valid unless the chromatogram obtained with solution (4) shows two principal spots that are close together but separated.

ASSAY

Weigh and powder 20 tablets. Suspend a quantity of the powder containing 10 mg of Methylprednisolone in 10 ml of *water* and extract with successive quantities of 100, 50, 50 and 40 ml of *chloroform*. Wash each extract with the same 10 ml quantity of *water*, filter and dilute the combined filtrates to 250 ml with *chloroform*. Evaporate 25 ml just to dryness, dissolve the residue in sufficient *aldehyde-free ethanol (96%)* to produce a solution containing between 390 and 410 µg of Methylprednisolone in 10 ml and complete the *tetrazolium assay of steroids*, Appendix VIII J, beginning at the words 'Transfer 10 ml…'.

Dissolve a quantity of *methylprednisolone BPCRS* in sufficient *aldehyde-free ethanol (96%)* to produce a solution containing between 390 and 410 µg in 10 ml and complete the tetrazolium assay beginning at the words 'Transfer 10 ml…'. From the *absorbances* so obtained, and using the declared content of $C_{22}H_{30}O_5$ in *methylprednisolone BPCRS,* calculate the content of $C_{22}H_{30}O_5$ in the tablets.

STORAGE

Methylprednisolone Tablets should be protected from light.

Methylthioninium Injection

General Notices

Action and use

Reducing agent; antidote to methaemoglobinaemia.

DEFINITION

Methylthioninium Injection is a sterile solution of Methylthioninium Chloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of methylthioninium chloride, $C_{16}H_{18}ClN_3S,3H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 240 to 800 nm of a solution diluted, if necessary, with *dilute hydrochloric acid* to contain 0.0005% w/v of Methylthioninium Chloride exhibits maxima at 255 to 260 nm, 285 to 290 nm, 675 to 685 nm and 740 to 750 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck plates are suitable) and a mixture of 20 volumes of *anhydrous formic acid* and 80 volumes of *propan-1-ol* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) use the injection diluted, if necessary, with *methanol* to produce a solution containing 0.01% w/v of Methylthioninium Chloride. Solution (2) contains 0.01% w/v of *methylthioninium chloride EPCRS* in *methanol*. After removal of the plate, allow it to dry in air protected from light and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). A *secondary spot* may appear above the principal spot in both chromatograms.

TESTS

Acidity

pH, 3.0 to 4.5, Appendix V L.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing 1% w/v of Methylthioninium Chloride (solution A). The endotoxin limit concentration of solution A is 2.5 IU of endotoxin per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

To a weighed quantity of the injection containing 0.3 g of Methylthioninium Chloride add 50 ml of *potassium dichromate solution R1*, dilute to 100 ml with *water* and allow to stand for 10 minutes. Filter and discard the first 20 ml of the filtrate. To 50 ml of the filtrate add 50 ml of 1M *sulphuric acid* and 8 ml of *potassium iodide solution*. Allow to stand protected from light for 5 minutes. Add 80 ml of *water* and titrate with 0.1M *sodium thiosulphate VS* using 2 ml of starch solution as indicator. Repeat the procedure without the preparation being examined. The difference between the titrations represents the amount of sodium thiosulphate required. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 12.45 mg of $C_{16}H_{18}ClN_3S,3H_2O$. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage of $C_{16}H_{18}ClN_3S,3H_2O$, weight in volume.

Methysergide Tablets

General Notices

Action and use

Non-selective 5HT receptor antagonist.

DEFINITION

Methysergide Tablets contain Methysergide Maleate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of methysergide, $C_{21}H_{27}N_3O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (8).

B. To 5 ml of solution A obtained in the Assay add 10 ml of *dimethylaminobenzaldehyde solution R6*. A violet-blue colour is produced.

TESTS

Dissolution

Carry out the following procedure protected from light. The tablets comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 500 ml of 0.1M *hydrochloric acid* and rotating the basket at 120 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter through a membrane filter having a nominal pore size not greater than 0.45 µm, discarding the first 10 ml of filtrate. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light. For solution (1) dissolve 15 mg of *methysergide maleate BPCRS* in 500 ml of 0.1M *hydrochloric acid* and dilute 10 ml to 100 ml with 0.1M *hydrochloric acid*. Solution (2) is the filtrate from the dissolution vessel.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Spherisorb C8 is suitable), (b) a mixture of 65 volumes of 0.01M *diammonium hydrogen orthophosphate* and 35 volumes of *acetonitrile* as the mobile phase with a flow rate of 2 ml per minute and (c) a fluorimetric detector with an excitation wavelength of 325 nm and an emission wavelength of 430 nm.

Calculate the total content of methysergide, $C_{21}H_{27}N_3O_2$, in the medium using the declared content of $C_{21}H_{27}N_3O_2$ in *methysergide maleate BPCRS*.

Related substances

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using a suspension of *silica gel G* in 0.1M *sodium hydroxide* to prepare the plate and a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) place a quantity of the powdered tablets containing the equivalent of 5.0 mg of methysergide in a sintered-glass filter, add 10 ml of *petroleum spirit (boiling range, 40° to 60°)*, stir for 2 minutes and filter. Repeat the washing with two further 10 ml quantities of the petroleum spirit and discard the washings. Extract with four 20 ml quantities of a solution prepared by shaking 100 ml of *chloroform* vigorously with 0.15 ml of 13.5M *ammonia*. Evaporate the filtrate to dryness at room temperature at a pressure of 2 kPa and dissolve the residue in 1 ml of a mixture of 1 volume of 13.5M *ammonia* and 100 volumes of *methanol*. Solutions (2), (3), (4), (5), (6) and (7) contain the equivalent of 0.0025% w/v, 0.005% w/v, 0.01% w/v, 0.015% w/v, 0.02% w/v and 0.025% w/v respectively of methysergide and are prepared by diluting appropriate volumes of solution (8) with a mixture of 1 volume of 13.5M *ammonia* and 100 volumes of *methanol*. For solution (8) dissolve 14 mg of *methysergide maleate BPCRS* in a mixture of 1 ml of *ethanol (96%)* and 19 ml of a 1% w/v solution of *(+)-tartaric acid*. Make alkaline by the addition of 0.15 ml of 13.5M *ammonia* and extract with successive quantities of 20, 10, 10 and 10 ml of *chloroform*. Filter the combined extracts and evaporate to dryness at room temperature at a pressure of 2 kPa. Dissolve the residue in 2 ml of a mixture of 1 volume of 13.5M *ammonia* and 100 volumes of *methanol*.

After removal of the plate, allow it to dry in air and examine under *ultraviolet light (365 nm)*. Assess the intensities of any *secondary spots* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with solutions (2) to (7), making allowance for area in assessing the intensities of spots with different Rf values and disregarding any spots less intense than the spot in the chromatogram obtained with solution (2). The sum of the intensities so assessed does not exceed 5% of the intensity of the principal spot in the chromatogram obtained with solution (1).

Uniformity of content

Tablets containing less than the equivalent of 2 mg of methysergide comply with the requirements stated under Tablets using the following method of analysis protected from light. To one tablet add 50 ml of a 1% w/v solution of *(+)-tartaric acid*, shake for 30 minutes and centrifuge. Measure the *absorbance* of the supernatant liquid at the maximum at 322 nm, Appendix II B. Calculate the content of $C_{21}H_{27}N_3O_2$ taking 227 as the value of A(1%, 1 cm) at the maximum at 322 nm.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 20 mg of methysergide add 50 ml of a 1% w/v solution of *(+)-tartaric acid* and 0.2 ml of a 20% w/v solution of *benzalkonium chloride* and shake for 30 minutes. Dilute with the tartaric acid solution to 100 ml, mix and filter, discarding the first few ml. To 10 ml of the filtrate add sufficient of the tartaric acid solution to produce 100 ml and measure the *absorbance* at the maximum at 322 nm, Appendix II B. Calculate the content of $C_{21}H_{27}N_3O_2$ taking 227 as the value of A(1%, 1 cm) at the maximum at 322 nm.

STORAGE

Methysergide Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of methysergide.

Metipranolol Eye Drops

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Metipranolol Eye Drops are a sterile solution in Purified Water of metipranolol hydrochloride prepared by the interaction of Metipranolol with Hydrochloric Acid.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of metipranolol, $C_{17}H_{27}NO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the eye drops containing 5 mg of Metipranolol with sufficient *water* to produce 50 ml. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a broad maximum between 273 nm and 282 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the eye drops, if necessary, with sufficient *methanol* to produce a solution containing 0.10% w/v of Metipranolol. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.002% w/v of *desacetylmetipranolol BPCRS* in *methanol*. Solution (4) contains 0.02% w/v of *metipranolol BPCRS* and 0.02% w/v of *desacetylmetipranolol BPCRS* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 1 volume of *perchloric acid*, 45 volumes of *methanol* and 54 volumes of *water*, the pH of the mixture being adjusted to 3.0 with 13.5M *ammonia* and (c) a detection wavelength of 275 nm. For solution (1) allow the chromatography to proceed for at least 3 times the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution*

factor between the two principal peaks is at least 5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to desacetylmetipranolol is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2%) and the sum of the areas of any other *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the eye drops, if necessary, with sufficient *methanol* to produce a solution containing 0.10% w/v of Metipranolol. Solution (2) is a 0.10% w/v solution of *metipranolol BPCRS* in *methanol*. Solution (3) contains 0.02% w/v of *metipranolol BPCRS* and 0.02% w/v of *desacetylmetipranolol BPCRS* in *methanol*.

The chromatographic procedure described under Related substances may be used.

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 5.

Calculate the content of $C_{17}H_{27}NO_4$ in the eye drops using the declared content of $C_{17}H_{27}NO_4$ in *metipranolol BPCRS*.

STORAGE

Metipranolol Eye Drops should be protected from light. The eye drops should not be allowed to freeze.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Metipranolol.

Metoclopramide Injection

General Notices

Action and use

Dopamine receptor antagonist; antiemetic.

Metoclopramide Hydrochloride formulations should reflect the Hydrochloride salt.

DEFINITION

Metoclopramide Injection is a sterile solution of Metoclopramide Hydrochloride in Water for Injections free from dissolved air.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2,HCl$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. In the test for Related substances the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (3).

B. To a volume containing the equivalent of 50 mg of anhydrous metoclopramide hydrochloride add 5 ml of *water* and 5 ml of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in 1M *hydrochloric acid*. A yellowish-orange colour is produced.

TESTS

Acidity

pH, 3.0 to 5.0, Appendix V L.

Related substances

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing the equivalent of 0.1% w/v of anhydrous metoclopramide hydrochloride. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. Solution (3) contains 0.0005% w/v of *metoclopramide hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS

1 is suitable), (b) 0.01M *sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*, as the mobile phase with a flow rate such that the retention time of the principal peak is about 8 minutes (1.8 ml per minute may be suitable) and (c) a detection wavelength of 265 nm.

The area of any *secondary peak* in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peaks with a retention time relative to the principal peak of 0.5 or less.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection with sufficient *water* to produce a solution containing the equivalent of 0.01% w/v of anhydrous metoclopramide hydrochloride. Solution (2) contains 0.01% w/v of *metoclopramide hydrochloride BPCRS* in *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 20 volumes of a solution prepared by dissolving 2.25 g of *sodium octanesulphonate* and 0.3 g of *sodium acetate* in sufficient *water* to produce 1000 ml and adjusting the pH, if necessary, to 3.8 with *glacial acetic acid* and 80 volumes of *methanol* and (c) a detection wavelength of 305 nm.

Calculate the content of $C_{14}H_{22}ClN_3O_2,HCl$ in the injection using the declared content of $C_{14}H_{22}ClN_3O_2,HCl$ in *metoclopramide hydrochloride BPCRS*.

STORAGE

Metoclopramide Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous metoclopramide hydrochloride.

Metoclopramide Oral Solution

General Notices

Action and use

Dopamine receptor antagonist; antiemetic.

Metoclopramide Hydrochloride formulations should reflect the Hydrochloride salt.

DEFINITION

Metoclopramide Oral Solution is a solution of Metoclopramide Hydrochloride in a suitable flavoured vehicle.
The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, of the final solution obtained in the Assay exhibits a maximum at 534 nm.

B. In the test for Related substances the retention time of the principal peak in the chromatogram obtained with solution (2) is similar to the retention time of the principal peak in the chromatogram obtained with solution (3).

Related substances

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the oral solution containing the equivalent of 10 mg of anhydrous metoclopramide hydrochloride with sufficient of the mobile phase to produce 10 ml and filter (Whatman GF/C filter paper is suitable). For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. Solution (3) contains 0.0005% w/v of *metoclopramide hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) 0.01M *sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*, as the mobile phase with a flow rate such that the retention time of the principal peak is about 8 minutes (1.8 ml per minute may be suitable) and (c) a detection wavelength of 265 nm.

The area of any *secondary peak* in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peaks with a retention time relative to the principal peak of 0.5 or less.

ASSAY

Protect the solutions from light. Dilute a quantity of the oral solution containing the equivalent of 10 mg of anhydrous metoclopramide hydrochloride to 100 ml with *water*. To 5 ml of this solution add 5 ml of 1M *hydrochloric acid*, mix, add 5 ml of a freshly prepared solution containing 1% w/v of *sodium nitrite*, mix and allow to stand for 10 minutes. Add 5 ml of a freshly prepared solution containing 5% w/v of *ammonium sulphamate*, mix and allow to stand for 25 minutes. Add 5 ml of a freshly prepared solution containing 0.5% w/v of N*-(1-naphthyl)ethylenediamine dihydrochloride* in 1M *hydrochloric acid*, mix, add sufficient *water* to produce 100 ml, mix and allow to stand for 5 minutes. Measure the *absorbance* of the resulting solution at the maximum at 534 nm, Appendix II B, using *water* in the reference cell. Calculate the content of $C_{14}H_{22}ClN_3O_2,HCl$ from the *absorbance* obtained by repeating the procedure using 5 ml of a 0.01% w/v solution of *metoclopramide hydrochloride BPCRS* in place of the solution being examined, beginning at the words 'add 5 ml of 1M *hydrochloric acid*… ', and using the declared content of $C_{14}H_{22}ClN_3O_2,HCl$ in *metoclopramide hydrochloride BPCRS*.

STORAGE

Metoclopramide Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous metoclopramide hydrochloride.

Metoclopramide Tablets

General Notices

Action and use

Dopamine receptor antagonist; antiemetic.

Metoclopramide Hydrochloride formulations should reflect the Hydrochloride salt.

DEFINITION

Metoclopramide Tablets contain Metoclopramide Hydrochloride.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous metoclopramide hydrochloride, $C_{14}H_{22}ClN_3O_2,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (3).

B. Shake a quantity of the powdered tablets containing the equivalent of 50 mg of anhydrous metoclopramide hydrochloride with 5 ml of *water*, filter and add to the filtrate 5 ml of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in 1M *hydrochloric acid*. A yellowish-orange colour is produced.

Related substances

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 0.1 g of anhydrous metoclopramide hydrochloride with 20 ml of *methanol* for 5 minutes, filter (Whatman GF/C filter paper is suitable) and add sufficient of the mobile phase to produce 100 ml. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. Solution (3) contains 0.0005% w/v of *metoclopramide hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) 0.01M *sodium hexanesulphonate* in a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*, adjusted to pH 4.0 with *glacial acetic acid*, as the mobile phase with a flow rate such that the retention time of the principal peak is about 8 minutes (1.8 ml per minute may be suitable) and (c) a detection wavelength of 265 nm.

The area of any *secondary peak* in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 20 mg of anhydrous metoclopramide hydrochloride with 80 ml of *water* with the aid of ultrasound for 10 minutes and then continue shaking mechanically for 20 minutes. Add sufficient *water* to produce 200 ml, filter and use the filtrate. Solution (2) contains 0.01% w/v of *metoclopramide hydrochloride BPCRS* in *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 20 volumes of a solution prepared by dissolving 2.25 g of *sodium octanesulphonate* and 0.3 g of *sodium acetate* in sufficient *water* to produce 1000 ml and adjusting the pH, if necessary, to 3.8 with *glacial acetic acid* and 80 volumes of *methanol* and (c) a detection wavelength of 305 nm.

Calculate the content of $C_{14}H_{22}ClN_3O_2,HCl$ in the tablets using the declared content of $C_{14}H_{22}ClN_3O_2,HCl$ in *metoclopramide hydrochloride BPCRS*.

STORAGE

Metoclopramide Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous metoclopramide hydrochloride.

Metoprolol Injection

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Metoprolol Injection is a sterile solution of Metoprolol Tartrate in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of metoprolol tartrate, $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume of the injection containing 20 mg of Metoprolol Tartrate add 2 ml of 5M *ammonia*, mix, extract with 30 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate* and evaporate the filtrate to dryness using a rotary evaporator with gentle heating if necessary. Cool the residue to –18° for 30 minutes and allow to warm to room temperature. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metoprolol *(RS 228)*.

B. In the test for Related substances, the chromatogram obtained with solution (2) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (4).

C. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection being examined diluted, if necessary, with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Metoprolol Tartrate. Solution (2) contains 0.2% w/v of *potassium sodium (+)-tartrate* in the mobile phase. For solution (3) mix 1 volume of solution (2) and 2 volumes of a solution containing 0.005% w/v of *fumaric acid* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with particles of silica the surface of which has been modified by chemically bonded amine groups (10 µm) (Lichrosorb NH_2 is suitable), (b) a solution containing 1% w/v of *sodium chloride* in a mixture of 25 volumes of *methanol* and 75 volumes of *water* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 210 nm.

The chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated peaks.

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) evaporate a volume of the injection containing 10 mg of Metoprolol Tartrate to dryness at a temperature not exceeding 40° and dissolve the residue in 2 ml of the mobile phase. For solution (2) dilute 6 volumes of solution (1) to 100 volumes with the mobile phase and further dilute 10 volumes of this solution to 100 volumes with the mobile phase. For solution (3) dilute 10 volumes of solution (2) to 20 volumes with the mobile phase. Solution (4) contains 0.0030% w/v of *metoprolol tartrate EPCRS* in the mobile phase. Solution (5) contains 0.0025% w/v of *metoprolol tartrate EPCRS* and 0.0015% w/v of *metoprolol impurity D EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable) maintained at a temperature of 40°, (b) as the *mobile phase* with a flow rate of 1 ml per minute a mixture of 2 volumes of *triethylamine*, 3 volumes of *orthophosphoric acid*, 10 volumes of *glacial acetic acid*, 190 volumes of *acetonitrile* and 810 volumes of a 0.48% w/v solution of *ammonium acetate* and (c) a detection wavelength of 275 nm. Equilibrate the column with the mobile phase with a flow rate of 1 ml per minute until a stable baseline is obtained (at least 20 minutes).

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of solution (3) is not less than 50% of the full scale of the recorder.

Inject 10 µl of solution (5). When the chromatograms are recorded under the prescribed conditions, the retention times are metoprolol, about 10 minutes and metoprolol impurity D, about 13.5 minutes. The test is not valid unless the *resolution factor* between the peaks corresponding to metoprolol impurity D and metoprolol is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 10 µl of solution (1) and 10 µl of solution (3). Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%) and the sum of the areas of any such peaks is not greater than 1.7 times the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). If any of the above limits are exceeded and if a secondary peak occurs with a retention time of about 5 minutes (metoprolol impurity C), prepare solution (6) in a fume cupboard in the following manner. Place an evaporating dish 10 cm in diameter containing 10 ml of a 0.1% w/v solution of *metoprolol tartrate EPCRS* in 0.1M *hydrochloric acid* so that the surface of the solution is 5 cm from a lamp emitting ultraviolet light at 254 nm for 6 hours. Dilute 1 volume of this solution to 50 volumes with the mobile phase (solution (6)).

In the chromatogram obtained with solution (1): divide the area of the peak corresponding to the principal peak in the chromatogram obtained with solution (6) (metoprolol impurity C) by 10: this divided area is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%); the sum of this divided area and the areas of any other *secondary peaks* is not greater than 1.7 times the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.06%).

ASSAY

Dilute a volume of the injection containing 3 mg of Metoprolol Tartrate to 20 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 274 nm, Appendix II B. Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ from the *absorbance* obtained with a 0.015% w/v solution of *metoprolol tartrate BPCRS* and from the declared content of $(C_{15}H_{25}NO_3)_2, C_4H_6O_6$ in *metoprolol tartrate BPCRS*.

Metoprolol Tartrate Tablets

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Metoprolol Tartrate Tablets contain Metoprolol Tartrate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of metoprolol tartrate, $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Mix a quantity of the powdered tablets containing 50 mg of Metoprolol Tartrate with 25 ml of *water*, add 2 ml of 5M *ammonia*, extract with 20 ml of *dichloromethane*, filter the dichloromethane layer through *anhydrous sodium sulphate*, wash the filter with 10 ml of *dichloromethane* and evaporate the combined filtrate and washings to dryness using a rotary evaporator, using gentle heat if necessary. Cool the residue to –18° for 30 minutes and allow to warm to room temperature. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metoprolol *(RS 228).*

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel H precoated plate (Analtech Uniplate plates are suitable) and a mixture of 40 volumes of *anhydrous formic acid* and 140 volumes of *ether* as the mobile phase, but allowing the solvent front to ascend 5 cm above the line of application. Pre-wash the plate with the mobile phase and allow to dry in air for at least 1 hour before use. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.5 g of Metoprolol Tartrate with 15 ml of *methanol* for 1 hour, add sufficient *methanol* to produce 25 ml and mix. Filter through a glass microfibre filter (Whatman GF/F is suitable) and use the filtrate. Solution (2) contains 2.0% w/v of *metoprolol tartrate BPCRS* in *methanol*. Solution (3) contains 0.5% w/v of *(+)-tartaric acid* in *methanol*. For solution (4) mix 1 volume of solution (1) with 1 volume of solution (3). After removal of the plate, allow it to dry in air for about 10 minutes, dry in an oven at 100° for 20 minutes and spray the plate with a solution prepared in the following manner. Dissolve 75 mg of *bromocresol green* and 25 mg of *bromophenol blue* in 100 ml of *absolute ethanol* (solution A); dissolve 0.25 g of *potassium permanganate* and 0.5 g of *sodium carbonate* in 100 ml of *water* (solution B); mix 9 volumes of solution A and 1 volume of solution B and use immediately. The chromatogram obtained with solution (1) closely resembles the chromatogram obtained with solution (2). In the chromatogram obtained with solution (1) the spot with the higher Rf value corresponds to the spot in the chromatogram obtained with solution (3). The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated principal spots; the spot of low Rf value is purple and the spot of high Rf value, which is a single, compact spot, is yellow.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Metoprolol Tartrate with 10 ml of *chloroform* for 10 minutes, centrifuge, remove and retain the supernatant layer. Extract the residue with a further 10 ml quantity of *chloroform*, centrifuge and remove the supernatant layer. Evaporate the combined chloroform extracts to dryness at a temperature not exceeding 40°, add sufficient mobile phase to produce 50 ml, mix and filter. Solution (2) contains 0.0025% w/v of *metoprolol tartrate EPCRS* and 0.0015% w/v of *metoprolol impurity D EPCRS* in the mobile phase. For solution (3) dilute 3 volumes of solution (1) to 100 volumes with the mobile phase and further dilute 10 volumes of this solution to 100 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable) maintained at a temperature of 40°, (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 2 volumes of *triethylamine*, 3 volumes of *orthophosphoric acid*, 10 volumes of *glacial acetic acid*, 190 volumes of *acetonitrile* and 810 volumes of a 0.48% w/v solution of *ammonium acetate* and (c) a detection wavelength of 275 nm. Equilibrate the column with the mobile phase at a flow rate of 1 ml per minute until a stable baseline is obtained (at least 20 minutes).

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of solution (3) is not less than 50% of the full scale of the recorder.

Inject 10 µl of solution (2). When the chromatograms are recorded under the prescribed conditions, the retention times are metoprolol, about 10 minutes and metoprolol impurity D, about 13.5 minutes. The test is not valid unless the *resolution factor* between the peaks corresponding to metoprolol impurity D and metoprolol is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 10 µl of solution (1) and 10 µl of solution (3). Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%) and the sum of the areas of any such peaks is not greater than 1.7 times the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). If any of the above limits are exceeded and if a secondary peak occurs with a retention time of about 5 minutes (metoprolol impurity C), prepare solution (4) in a fume cupboard in the following manner. Place an evaporating dish 10 cm in diameter containing 10 ml of a 0.1% w/v solution of *metoprolol tartrate EPCRS* in 0.1M *hydrochloric acid* so that the surface of the solution is 5 cm from a lamp emitting ultraviolet light at 254 nm for 6 hours. Dilute 1 volume of this solution to 50 volumes with the mobile phase (solution (4)).

In the chromatogram obtained with solution (1): divide the area of the peak corresponding to the principal peak in the chromatogram obtained with solution (4) (metoprolol impurity C) by 10: this divided area is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%); the sum of this divided area and the areas of any other *secondary peaks* is not greater than 1.7 times the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (3) (0.06%).

ASSAY

Weigh and powder 20 tablets. Add to a quantity of the powdered tablets containing 75 mg of

Metoprolol Tartrate 150 ml of *absolute ethanol*, shake with the aid of ultrasound for 15 minutes, allow to cool, add sufficient *absolute ethanol* to produce 200 ml and filter (Whatman GF/C paper is suitable). To 20 ml of the filtrate add sufficient *absolute ethanol* to produce 50 ml and measure the *absorbance* of the resulting solution at the maximum at 274 nm, Appendix II B. Calculate the content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ from the *absorbance* obtained with a 0.015% w/v solution of *metoprolol tartrate BPCRS* in *absolute ethanol* and from the declared content of $(C_{15}H_{25}NO_3)_2,C_4H_6O_6$ in *metoprolol tartrate BPCRS*.

Metronidazole Gel

General Notices

Action and use

Imidazole antibacterial.

DEFINITION

Metronidazole Gel contains Metronidazole in a suitable water-soluble basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of metronidazole, $C_6H_9N_3O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 6.0, Appendix V L.

Nitrite

Disperse 1.0 g of the gel in sufficient *water* to produce 100 ml. To 40 ml of the solution add 2 ml of *sulphanilic acid solution*, 2 ml of *aminonaphthalenesulphonic acid solution* and sufficient *water* to produce 50 ml. Allow to stand at room temperature for 1 hour. Measure the *absorbance* of the resulting solution at the maximum at 524 nm, Appendix II B, using in the reference cell a solution prepared by treating 40 ml of *water* in the same manner, beginning at the words 'add 2 ml of *sulphanilic acid solution*...'. The *absorbance* is not greater than that obtained by repeating the procedure using 1 ml of *nitrite standard solution (20 ppm)* diluted to 40 ml with *water* and treated at the same time and in the same manner, beginning at the words 'add 2 ml of *sulphanilic acid solution*...' (50 ppm, calculated with reference to the gel).

2-Methyl-5-nitroimidazole

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and as the mobile phase a mixture of 1 volume of *water*, 10 volumes of *ethanol (96%)*, 10 volumes of *diethylamine* and 80 volumes of *dichloromethane*. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake for 1 hour a quantity of the gel containing 45 mg of Metronidazole with 150 ml of *methanol*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of a mixture of equal volumes of *dichloromethane* and *methanol*. Solution

(2) contains 0.0023% w/v of *2-methyl-5-nitroimidazole* in a mixture of equal volumes of *dichloromethane* and *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray with *titanium(III) chloride solution* and heat at 110° until the blue-grey colour disappears, cool and spray with a 1% w/v solution of *fast blue B salt* followed by a mixture of 5 volumes of *ethanol (96%)*, 3 volumes of *water* and 2 volumes of 18M *ammonia*. Any *secondary spot* corresponding to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the gel in 10 ml of *methanol (8%)* to produce a solution containing 0.030% w/v of Metronidazole. For solution (2) dissolve 37.5 mg of *metronidazole BPCRS* in 10 ml of *methanol (8%)* and dilute 2 ml of this solution to 25 ml with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2) is suitable, (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 3 volumes of *methanol* and 97 volumes of 0.005M *potassium dihydrogen orthophosphate*, the pH of the mixture being adjusted to 4.0 with *orthophosphoric acid*, and (c) a detection wavelength of 240 nm.

Calculate the content of $C_6H_9N_3O_3$ in the gel using the declared content of $C_6H_9N_3O_3$ in *metronidazole BPCRS*.

Metronidazole Intravenous Infusion

General Notices

Action and use

Imidazole antibacterial.

DEFINITION

Metronidazole Intravenous Infusion is a sterile solution of Metronidazole in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of metronidazole, $C_6H_9N_3O_3$

95.0 to 110.0% of the stated amount.

CHARACTERISTICS

An almost colourless to pale yellow solution.

IDENTIFICATION

Shake a volume of the intravenous infusion containing 0.1 g of Metronidazole with 9 g of *sodium chloride* for 5 minutes, add 20 ml of *acetone*, shake for a further 5 minutes and allow to separate. Evaporate the upper layer to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metronidazole *(RS 229)*.

TESTS

Acidity

pH, 4.5 to 6.0, Appendix V L.

Related substances

Carry out the test described under Metronidazole Tablets but preparing solution (2) in the following manner. Dilute a suitable volume of the intravenous infusion with sufficient mobile phase to produce a solution containing 0.1% w/v of Metronidazole.

In the chromatogram obtained with solution (2) the area of any *secondary peak* is not greater than the area of the peak due to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (1) (0.5%).

Nitrite

To a volume of the infusion containing 2.5 mg of Metronidazole add 40 ml of *water*, 2 ml of *sulphanilic acid solution*, 2 ml of *aminonaphthalenesulphonic acid solution* and sufficient *water* to produce 50 ml. Allow to stand at room temperature for 1 hour. Measure the *absorbance* of the resulting solution at the maximum at 524 nm, Appendix II B, using in the reference cell a solution prepared by treating 1 ml of *water* in the same manner, beginning at the words 'add 40 ml…'. The *absorbance* is not greater than that obtained by repeating the procedure using 1 ml of *nitrite standard solution (20 ppm)* treated at the same time and in the same manner, beginning at the words 'add 40 ml of *water* …' (0.8%, calculated with reference to the content of metronidazole).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the intravenous infusion, if necessary, with *water BET* to give a solution containing 5 mg per ml (solution A). The endotoxin limit concentration of solution A is 3.5 IU per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Dilute a volume of the infusion containing 50 mg of Metronidazole to 100 ml with 0.1M *hydrochloric acid*. Dilute 10 ml of the resulting solution to 250 ml with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 277 nm, Appendix II B. Calculate the content of $C_6H_9N_3O_3$ taking 375 as the value of A(1%, 1 cm) at the maximum at 277 nm.

STORAGE

Metronidazole Intravenous Infusion should be protected from light.

LABELLING

The label states that solutions containing visible solid particles must not be used.

Metronidazole Oral Suspension

General Notices

Action and use

Imidazole antibacterial.

DEFINITION

Metronidazole Oral Suspension is a suspension of Metronidazole Benzoate in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of metronidazole, $C_6H_9N_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a volume of the oral suspension containing the equivalent of 200 mg of metronidazole with 20 ml of *water*, filter under partial vacuum and wash the residue with three 10-ml quantities of *water* (Whatman GF/C filter paper is suitable). Dissolve the residue as completely as possible in 10 ml of *acetone*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue after drying at 60°, Appendix II A, is concordant with the *reference spectrum* of metronidazole benzoate (*RS 408*). Examine as discs prepared using potassium bromide.

TESTS

Acidity

pH, 5.0 to 6.5, Appendix V L.

Metronidazole

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the oral suspension containing the equivalent of 200 mg of metronidazole with 150 ml of *methanol*, add sufficient *water*, with mixing and cooling, to produce 250 ml, mix and centrifuge. For solution (2) dissolve 20 mg of *metronidazole BPCRS* in 150 ml of *methanol* and add sufficient *water*, with mixing and cooling, to produce 250 ml. Dilute 1 volume to 10 volumes with *methanol (60%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 40 volumes of a 1.25% w/v solution of *ammonium acetate*, adjusted to pH 7.0 with *dilute acetic acid* or *dilute ammonia R1*, as appropriate, and 60 volumes of *methanol* and (c) a detection wavelength of 310 nm.

In the chromatogram obtained with solution (1) the area of any peak corresponding to metronidazole is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the oral suspension containing the equivalent of 200 mg of metronidazole with 150 ml of *methanol*, add sufficient *water*, with mixing and cooling, to produce 250 ml, mix and centrifuge. Dilute 1 volume to 10 volumes with *methanol (60%)*. For solution (2) dissolve 62.5 mg of *metronidazole benzoate BPCRS* in 1 ml of *dimethylformamide* and 30 ml of *methanol* and add sufficient *water*, with mixing and cooling, to produce 50 ml. Dilute 1 volume to 10 volumes with *methanol (60%)*.

The chromatographic procedure described under the test for Metronidazole may be used.

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_6H_9N_3O_3$, weight in volume, using the declared content of $C_6H_9N_3O_3$ in *metronidazole benzoate BPCRS*.

STORAGE

Metronidazole Oral Suspension should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of metronidazole.

Metronidazole Suppositories

General Notices

Action and use

Imidazole antibacterial.

DEFINITION

Metronidazole Suppositories contain Metronidazole in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of metronidazole, $C_6H_9N_3O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Dissolve a quantity of the suppositories containing 0.5 g of Metronidazole as completely as possible by heating with 30 ml of *petroleum spirit (boiling range, 40° to 60°)* on a water bath. Filter, wash the residue with the same solvent and dry at 100°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metronidazole *(RS 229)*.

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) melt a quantity of the suppositories containing 0.25 g of Metronidazole using gentle heat, allow to cool and dissolve as completely as possible in 20 ml of *petroleum spirit (boiling range, 40° to 60°)* by warming on a water bath. Filter, wash the residue with *petroleum spirit (boiling range, 40° to 60°)*, dry in a current of air and dissolve in 250 ml of the mobile phase. Solutions (2) and (3) contain 0.00050% w/v of *2-methyl-5-nitroimidazole BPCRS* in the mobile phase and in solution (1) respectively.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 30 volumes of *methanol* and 70 volumes of 0.01M *potassium dihydrogen orthophosphate* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 315 nm. Record the chromatogram for 3 times the retention time of the principal peak in the chromatogram obtained with solution (2).

Adjust the sensitivity so that the height of the peak due to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (3) is about 50% of full-scale deflection on the chart paper. Measure the height *(a)* of the peak due to 2-methyl-5-nitroimidazole and the height (*b*) of the lowest part of the curve separating this peak from the principal peak. The test is not valid unless *a* is greater than 10*b*.

The area of any *secondary peak* in the chromatogram obtained with solution (1) is not greater than the area of the peak due to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh five suppositories, melt together by warming and allow to cool, stirring continuously until the mass is set. To a quantity containing 0.5 g of Metronidazole add 60 ml of *anhydrous acetic acid*, previously neutralised to *1-naphtholbenzein solution* with 0.1M *perchloric acid VS*, warm at 30° for 30 minutes and shake for 5 minutes. Cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *1-naphtholbenzein solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 17.12 mg of $C_6H_9N_3O_3$.

STORAGE

Metronidazole Suppositories should be protected from light.

Metronidazole Tablets

General Notices

Action and use

Imidazole antibacterial.

DEFINITION

Metronidazole Tablets contain Metronidazole.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of metronidazole, $C_6H_9N_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Metronidazole with 40 ml of *chloroform* for 15 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of metronidazole *(RS 229)*.

B. Shake a quantity of the powdered tablets containing 0.2 g of Metronidazole with 4 ml of 0.5M *sulphuric acid* and filter. To the filtrate add 10 ml of *picric acid solution R1* and allow to stand. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 150°, Appendix V A.

C. Heat a quantity of the powdered tablets containing 10 mg of Metronidazole on a water bath with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml of *hydrochloric acid* for 5 minutes, cool in ice, add 0.5 ml of *sodium nitrite solution* and remove the excess of nitrite with *sulphamic acid*. Add 0.5 ml of *2-naphthol solution* and 2 ml of 5M *sodium hydroxide*. An orange-red colour is produced.

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.00050% w/v of *2-methyl-5-nitroimidazole BPCRS* in the mobile phase. For solution (2) shake a quantity of the powdered tablets containing 0.2 g of Metronidazole with 100 ml of the mobile phase for 5 minutes, dilute to 200 ml with the mobile phase, filter and use the filtrate. Solution (3) contains 0.00050% w/v of *2-methyl-5-nitroimidazole BPCRS* in solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 30 volumes of *methanol* and 70 volumes of 0.01M *potassium dihydrogen orthophosphate* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 315 nm. Record the chromatograms for 3 times the retention time of the principal peak in the chromatogram obtained with solution (2).

Adjust the sensitivity so that the height of the peak due to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (3) is about 50% of full-scale deflection. Measure the height (*a*) of the peak due to 2-methyl-5-nitroimidazole and the height (*b*) of the lowest part of the curve separating this peak from the principal peak. The test is not valid unless *a* is greater than 10*b*.

The area of any *secondary peak* in the chromatogram obtained with solution (2) is not greater than the area of the peak due to 2-methyl-5-nitroimidazole in the chromatogram obtained with solution (1).

ASSAY

Weigh and powder 20 tablets. Transfer a quantity of the powder containing 0.2 g of Metronidazole to a sintered-glass crucible and extract with six 10 ml quantities of hot *acetone*. Cool, add to the combined extracts 50 ml of *acetic anhydride* and 0.1 ml of a 1% w/v solution of *brilliant green* in *anhydrous acetic acid* and titrate with 0.1M *perchloric acid VS* to a yellowish-green end point. Repeat the operation without the powdered tablets. The difference between the titrations represents the amount of perchloric acid required. Each ml of 0.1M *perchloric acid VS* is equivalent to 17.12 mg of $C_6H_9N_3O_3$.

Metyrapone Capsules

General Notices

Action and use

11-Beta hydroxylase inhibitor; inhibition of the formation of corticosteroids.

DEFINITION

Metyrapone Capsules contain Metyrapone.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of metyrapone, $C_{14}H_{14}N_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum* of the contents of the capsules, Appendix II A, is concordant with *reference spectrum 2* of metyrapone *(RS 231)*.

B. To a quantity of the contents of the capsules containing 50 mg of Metyrapone add 5 ml of 0.5M *sulphuric acid* and 0.2 ml of *potassium tetraiodomercurate solution*. A cream precipitate is produced.

TEST

Related substances

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of 13.5M *ammonia,* 5 volumes of *water* and 90 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dissolve a quantity of the contents of the capsules containing 0.5 g of Metyrapone in 10 ml of *chloroform*. For solution (2) dilute 1 volume of solution (1) to 500 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Weigh 10 capsules. Open the capsules carefully without loss of shell material, express as much of the contents as possible and reserve the expressed material. Wash the shells with *ether*, discard the washings, allow the shells to stand at room temperature for about 5 minutes and weigh. The difference between the weights represents the weight of the total contents. Dissolve a quantity of the contents containing 0.1 g of Metyrapone in 40 ml of 0.1M *hydrochloric acid* and add sufficient 0.1M *hydrochloric acid* to produce 100 ml. Dilute 5 ml to 50 ml with 0.1M *hydrochloric acid* and dilute 5 ml of this solution to 50 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 260 nm, Appendix II B. Calculate the content of $C_{14}H_{14}N_2O$ taking 500 as the value of A(1%, 1 cm) at the maximum at 260 nm.

STORAGE

Metyrapone Capsules should be protected from light.

Mexenone Cream

General Notices

Action and use

Sunscreen.

DEFINITION

Mexenone Cream is a dispersion of Mexenone in a suitable basis.
The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of mexenone, $C_{15}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *butan-2-one* and 100 volumes of *toluene* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) disperse a quantity of the cream containing 0.1 g of Mexenone in 50 ml of *water*, add 5 g of *sodium chloride*, extract with two 25 ml quantities of *chloroform*, wash the combined extracts with 50 ml of *water* and filter the chloroform solution through *kieselguhr*. Solution (2) contains 0.2% w/v of *mexenone BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

Acidity

pH of a dispersion prepared by mixing 4 g with 20 ml of *carbon dioxide-free water*, 4.0 to 5.0, Appendix V L.

ASSAY

To a quantity containing 20 mg of Mexenone add 20 ml of *methanol*, warm to disperse, dilute to 100 ml with *methanol* and filter, discarding the first portion of the filtrate. Dilute 20 ml of the clear filtrate to 100 ml with *methanol*, further dilute 20 ml of this solution to 100 ml with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 287 nm, Appendix II B. Calculate the content of $C_{15}H_{14}O_3$ taking 640 as the value of A(1%, 1 cm) at the maximum at 287 nm.

Mexiletine Capsules

General Notices

Action and use

Class I antiarrhythmic.

DEFINITION

Mexiletine Capsules contain Mexiletine Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of mexiletine hydrochloride, $C_{11}H_{17}NO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 50 mg of Mexiletine Hydrochloride with 10 ml of *methanol* for 15 minutes, filter (Whatman GF/C filter paper is suitable), evaporate to dryness on a rotary evaporator and dry the residue at 105° for 2 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of mexiletine hydrochloride *(RS 233)*.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) has the same retention time as that of the principal peak in the chromatogram obtained with solution (3).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix, with the aid of ultrasound for 10 minutes, a quantity of the contents of the capsules containing 0.2 g of Mexiletine Hydrochloride with 10 ml of the mobile phase, filter through a 0.4-µm glass microfibre filter (Whatman GF/C is suitable) and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 10 volumes with the mobile phase. For solution (3) dissolve 2 mg of *mexiletine impurity C EPCRS* and 16 mg of *2,6-dimethylphenol* in the mobile phase and add sufficient mobile phase to produce 20 ml. Mix 1 volume of this solution with 2 volumes of solution (2) and add sufficient mobile phase to produce 100 volumes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil is suitable), (b) as mobile phase with a flow rate of 1 ml per minute a mixture of 35 volumes of solution A described below and 65 volumes of *methanol R2* and (c) a detection wavelength of 262 nm. For solution (A) dissolve 11.5 g of *anhydrous sodium acetate* in 500 ml of *water*, add 3.2 ml of *glacial acetic acid*, mix and allow to cool. Adjust the pH to 4.8 with *glacial acetic acid* and add sufficient *water* to produce 1000 ml. For solution (1) allow the chromatography to proceed for 5.5 times the retention time of mexiletine.

When the chromatograms are recorded in the prescribed conditions, the retention time of mexiletine is about 4 minutes and retention times relative to mexiletine are about 0.7 for mexiletine impurity C (1,1′-[(3,3′,5,5′-tetramethylbiphenyl-4,4′-diyl)bisoxy]dipropan-2-amine) and about 1.8 for mexiletine impurity A (2,6-dimethylphenol).

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to mexiletine and impurity C is at least 5.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to impurity A is not greater than 2.5 times the area of the peak due to *2,6-dimethylphenol* in the chromatogram obtained with solution (3) (0.1%), the area of any peak corresponding to impurity C is not greater than 20 times the area of the peak due to impurity C in the chromatogram obtained with solution (3) (0.1%), the area of any other *secondary peak* is not greater than half the area of the peak due to mexiletine in the chromatogram obtained with solution (3) (0.1%) and the sum of the areas of all the peaks is not greater than 2.5 times the area of the peak due to mexiletine in the chromatogram obtained with solution (3) (0.5%). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 50 mg of Mexiletine Hydrochloride with 50 ml of 0.01M *hydrochloric acid* for 30 minutes. Dilute to 100 ml with 0.01M *hydrochloric acid* and centrifuge. Measure the *absorbance* of the supernatant liquid at the maximum at 260 nm, Appendix II B. Calculate the content of $C_{11}H_{17}NO,HCl$ taking 11.6 as the value of A(1%, 1 cm) at the maximum at 260 nm.

Mexiletine Injection

General Notices

Action and use

Class I antiarrhythmic.

DEFINITION

Mexiletine Injection is a sterile solution of Mexiletine Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of mexiletine hydrochloride, $C_{11}H_{17}NO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) has the same retention time as that of the principal peak in the chromatogram obtained with solution (3).

B. A volume containing 2.5 mg of Mexiletine Hydrochloride diluted to 2 ml yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Related substances

Complies with the test described under Mexiletine Capsules but using a solution prepared in the following manner as solution (1). Dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing 2.0% w/v of Mexiletine Hydrochloride.

ASSAY

Dilute a volume containing 0.125 g of Mexiletine Hydrochloride to 250 ml with 0.01M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 260 nm, Appendix II B. Calculate the content of $C_{11}H_{17}NO,HCl$ taking 11.6 as the value of A(1%, 1 cm) at the maximum at 260 nm.

Mianserin Tablets

General Notices

Action and use

Monoamine reuptake inhibitor; tetracyclic antidepressant.

DEFINITION

Mianserin Tablets contain Mianserin Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mianserin hydrochloride, $C_{18}H_{20}N_2,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 20 mg of Mianserin Hydrochloride with 10 ml of *methanol*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of mianserin hydrochloride *(RS 234)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as that due to mianserin in the chromatogram obtained with solution (1).

C. The residue obtained in test A yields the reactions characteristic of *chlorides*, Appendix VI.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *methanol* and 90 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) triturate a quantity of the powdered tablets containing 40 mg of Mianserin Hydrochloride with 2 ml of a mixture of 4 volumes of *methanol* and 1 volume of 13.5M *ammonia* and centrifuge. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent mixture. For solution (3) dilute 1 volume of solution (1) to 500 volumes with the same solvent mixture. After removal of the plate, allow it to dry in a current of cold air for 5 minutes and then expose to iodine vapour for 20 minutes. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.2%). Disregard any spot with an Rf value lower than 0.15.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) add 3 ml of 1M *sodium hydroxide* and 10 ml of *toluene* containing 0.2% w/v of *triphenylamine* (internal standard) to 10 ml of a solution containing 0.2% w/v of *mianserin hydrochloride BPCRS* in 0.2M *hydrochloric acid*, mix for 5 minutes with a vortex mixer, centrifuge and use the clear upper layer. For solution (2) shake a quantity of the powdered tablets containing 60 mg of Mianserin Hydrochloride with 30 ml of 0.2M *hydrochloric acid* for 1 hour and filter. To 10 ml of the filtrate add 3 ml of 1M *sodium hydroxide* and 10 ml of *toluene*, mix for 5 minutes with a vortex mixer, centrifuge and use the clear upper layer. For solution (3) treat a further 10 ml of the filtrate obtained under solution (2) in the same manner as for solution (1) beginning at the words 'add 3 ml of 1M *sodium hydroxide…*'.

The chromatographic procedure may be carried out using a glass column (1.0 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenylmethyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 255°.

Calculate the content of $C_{18}H_{20}N_2$,HCl using the declared content of $C_{18}H_{20}N_2$,HCl in *mianserin hydrochloride BPCRS*.

STORAGE

Mianserin Tablets should be protected from light.

Miconazole and Hydrocortisone Acetate Cream

General Notices

Action and use

Antifungal azole.

DEFINITION

Miconazole and Hydrocortisone Acetate Cream contains Miconazole Nitrate and Hydrocortisone Acetate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using a precoated silica gel F_{254} plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *ammonium acetate,* 40 volumes of *dioxan* and 40 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) disperse a quantity of the cream containing 0.15 g of Miconazole Nitrate by shaking with 25 ml of *methanol* for about 30 minutes, dilute to 50 ml with *methanol,* filter and use the filtrate. Solution (2) contains 0.3% w/v of *miconazole nitrate BPCRS* in *methanol.* Solution (3) contains 0.15% w/v of *hydrocortisone acetate BPCRS* in *methanol.* Solution (4) contains 0.15% w/v of *hydrocortisone BPCRS* and 0.15% w/v of *hydrocortisone acetate BPCRS* in *methanol.* After removal of the plate, allow it to dry in air, expose to iodine vapour until spots appear and examine in daylight. The principal spots in the chromatogram obtained with solution (1) are similar in position, colour and size to those in the chromatograms obtained with solutions (2) and (3). The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

B. In the Assay for miconazole nitrate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to miconazole nitrate in the chromatogram obtained with solution (2).

C. In the Assay for hydrocortisone acetate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a 10% w/v dispersion in *carbon dioxide-free water*, 3.5 to 4.5, Appendix V L.

Related substances

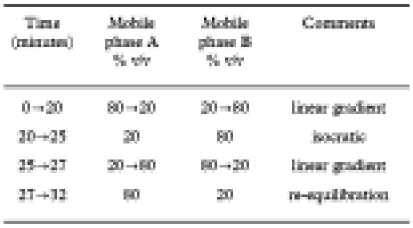
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 25 mg of Miconazole Nitrate with 30 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 50 ml and filter (Whatman GF/F is suitable). For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.02% w/v each of *miconazole impurity A EPCRS* and *2,4-dichlorobenzenemethanol* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil BDS is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 235 nm.

Inject 20 µl of each solution.

Mobile phase A A solution containing 0.01M *ammonium dihydrogen orthophosphate* adjusted to pH 6.0 with *dilute ammonia R1*.

Mobile phase B A mixture of 10 volumes of *tetrahydrofuran* and 90 volumes of *acetonitrile*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comments
0→20	80→20	20→80	linear gradient
20→25	20	80	isocratic
25→27	20→80	80→20	linear gradient
27→32	80	20	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention times are: hydrocortisone acetate, about 8 minutes; miconazole, about 18 minutes.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is greater than 5.0.

In the chromatogram obtained with solution (1), the area of any peak other than those of Hydrocortisone acetate and Miconazole is not greater than the area of the miconazole peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any such peaks is not greater than five times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%). Disregard any peak due to nitrate ion and any peak with an area less than 0.2 times the area of the peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

For miconazole nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 50 mg of Miconazole Nitrate with 50 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter if necessary. Solution (2) contains 0.050% w/v of *miconazole nitrate BPCRS* in *methanol*. Solution (3) contains 0.02% w/v each of *miconazole impurity A EPCRS* and *2,4-dichlorobenzenemethanol*.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is greater than 5.0.

Calculate the content of $C_{18}H_{14}Cl_4N_2O$ in the preparation being examined using the declared content of $C_{18}H_{14}Cl_4N_2O.HNO_3$ in *miconazole nitrate BPCRS.*

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 25 mg of Hydrocortisone Acetate with 50 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter if necessary. Solution (2) contains 0.025% w/v of *hydrocortisone acetate BPCRS* in *methanol*. Solution (3) contains 0.02% w/v each of *miconazole impurity A EPCRS* and *2,4-dichlorobenzenemethanol*.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is greater than 5.0.

Calculate the content of $C_{23}H_{32}O_6$ in the preparation being examined using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Miconazole Nitrate and the following:

2,4-dichlorobenzenemethanol,

2,4-dichloro-β-[2,4-dichlorophenyl)-methoxy]benzene ethanamine,

N-[2-(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)-methoxy]ethyl]formamide.

Miconazole and Hydrocortisone Cream

General Notices

Action and use

Antifungal azole.

DEFINITION

Miconazole and Hydrocortisone Cream contains Miconazole Nitrate and Hydrocortisone in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using a precoated silica gel F_{254} plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *ammonium acetate,* 40 volumes of *dioxan* and 40 volumes of *methanol* as the mobile phase. For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 25 mg of Hydrocortisone with 50 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter if necessary. Solution (2) contains 0.025% w/v of *hydrocortisone BPCRS* in *methanol*. Solution (3) contains 0.02% w/v each of *miconazole impurity A EPCRS* and *2,4-dichlorobenzenemethanol* in *methanol*.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is greater than 5.0.

Calculate the content of $C_{21}H_{30}O_5$ in the preparation being examined using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS.*

STORAGE

Miconazole and Hydrocortisone Cream should be stored at a temperature of 2° to 8°.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Miconazole Nitrate and the following:

2,4-dichlorobenzenemethanol,

2,4-dichloro-β-[2,4-dichlorophenyl)-methoxy]benzene ethanamine,

N-[2-(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)-methoxy]ethyl]formamide.

Miconazole and Hydrocortisone Ointment

General Notices

Action and use

Antifungal azole.

DEFINITION

Miconazole and Hydrocortisone Ointment contains Miconazole Nitrate and Hydrocortisone in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using a precoated silica gel F_{254} plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *ammonium acetate,* 40 volumes of *dioxan* and 40 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) disperse a quantity of the ointment containing 0.15 g of Miconazole Nitrate by shaking with 25 ml of *tetrahydrofuran* for about 30 minutes, dilute to 50 ml with *methanol,* filter and use the filtrate. Solution (2) contains 0.3% w/v of *miconazole nitrate BPCRS* in equal volumes of *methanol* and *tetrahydrofuran.* Solution (3) contains 0.15% w/v of *hydrocortisone BPCRS* in equal volumes of *methanol* and *tetrahydrofuran.* Solution (4) contains 0.15% w/v of *hydrocortisone BPCRS* and 0.15% w/v of *hydrocortisone acetate BPCRS* in equal volumes of *methanol* and *tetrahydrofuran.* After removal of the plate, allow it to dry in air and expose to iodine vapour until spots appear and examine in daylight. The principal spots in the chromatogram obtained with solution (1) are similar in position, colour and size to those in the chromatograms obtained with solutions (2) and (3). The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

B. In the Assay for miconazole nitrate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to miconazole nitrate in the chromatogram obtained with solution (2).

C. In the Assay for hydrocortisone, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the ointment containing 50 mg of Miconazole Nitrate with 50 ml of *tetrahydrofuran* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter (Whatman GF/F is suitable). For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.02% w/v each of *miconazole impurity A EPCRS* and *2, 4-dichlorobenzenemethanol* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil BDS is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 235 nm.

Inject 20 µl of each solution.

Mobile phase A A solution containing 0.01M *ammonium dihydrogen orthophosphate* adjusted to pH 6.0 with *dilute ammonia R1*.

Mobile phase B A mixture of 10 volumes of *tetrahydrofuran* and 90 volumes of *acetonitrile*.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is greater than 5.0.

Calculate the content of $C_{21}H_{30}O_5$ in the preparation being examined using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Miconazole Nitrate and the following:

2,4-dichlorobenzenemethanol,

2,4-dichloro-β-[2,4-dichlorophenyl)-methoxy]benzene ethanamine,

N-[2-(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)-methoxy]ethyl]formamide.

Miconazole Cream

General Notices

Action and use

Antifungal azole.

DEFINITION

Miconazole Cream contains Miconazole Nitrate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of miconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Mix a quantity containing 40 mg of Miconazole Nitrate with 20 ml of a mixture of 1 volume of 1M *sulphuric acid* and 4 volumes of *methanol* and shake with two 50 ml quantities of *hexane*, discarding the organic layers. Make the aqueous phase alkaline with 2M *ammonia* and extract with two 40 ml quantities of *chloroform*. Combine the chloroform extracts, shake with 5 g of *anhydrous sodium sulphate*, filter and dilute the filtrate to 100 ml with *chloroform*. Evaporate 50 ml to dryness and dissolve the residue in 50 ml of a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits maxima at 264, 272 and 280 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to miconazole in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 50 mg of Miconazole Nitrate with 30 ml of a mixture of equal volumes of *methanol* and *tetrahydrofuran* for 30 minutes, add sufficient of the same solvent mixture to produce 50 ml and filter through a glass microfibre filter (Whatman GF/C is suitable). For solution (2) dilute 5 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *methanol* and *tetrahydrofuran* and 5 volumes of the resulting solution to 100 volumes with the same solvent mixture. Solution (3) contains 0.0025% w/v of *miconazole nitrate BPCRS* and 0.0025% w/v of *econazole nitrate BPCRS* in a mixture of equal volumes of *methanol* and *tetrahydrofuran*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil 3 ODS is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a

0.6% w/v solution of *ammonium acetate* in a mixture of 300 volumes of *acetonitrile*, 320 volumes of *methanol* and 380 volumes of *water* and (c) a detection wavelength of 235 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to miconazole and econazole is at least 10. If necessary adjust the composition of the mobile phase.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%) and the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the cream containing 50 mg of Miconazole Nitrate with 30 ml of a mixture of equal volumes of *methanol* and *tetrahydrofuran* for 30 minutes, add sufficient of the same solvent mixture to produce 50 ml and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) contains 0.1% w/v of *miconazole nitrate BPCRS* in a mixture of equal volumes of *methanol* and *tetrahydrofuran.* Solution (3) contains 0.0025% w/v of *miconazole nitrate BPCRS* and 0.0025% w/v of *econazole nitrate BPCRS* in a mixture of equal volumes of *methanol* and *tetrahydrofuran*.

The chromatographic procedure described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to miconazole and econazole is at least 10. If necessary adjust the composition of the mobile phase.

Calculate the content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in the cream using the declared content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in *miconazole nitrate BPCRS*.

STORAGE

If Miconazole Cream is kept in aluminium tubes, their inner surfaces should be coated with a suitable lacquer.

Miconazole Oromucosal Gel

General Notices

Action and use

Antifungal azole.

DEFINITION

Miconazole Oromucosal Gel is a suspension of Miconazole, in *very fine powder*, in a suitable water-miscible basis. It may be flavoured.

The oromucosal gel complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of miconazole, $C_{18}H_{14}Cl_4N_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the gel containing 20 mg of Miconazole with sufficient *methanol* to produce a 0.05% w/v solution. The *light absorption* of this solution, Appendix II B, in the range 250 to 350 nm exhibits two maxima at 272 and 280 nm and a broad shoulder at about 263 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the gel containing 50 mg of Miconazole with 25 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 50 ml and filter through a glass microfibre filter (Whatman GF/C is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 5 volumes of the resulting solution to 20 volumes with *methanol*. Solution (3) contains 0.0025% w/v each of *miconazole nitrate BPCRS* and *econazole nitrate BPCRS* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a 0.6% w/v solution of *ammonium acetate* in a mixture of 300 volumes of *acetonitrile*, 320 volumes of *methanol* and 380 volumes of *water* and (c) a detection wavelength of 235 nm.

Inject 10 µl of solution (3). The test is not valid unless the *resolution factor* between the peaks due to miconazole and econazole is at least 10.

Inject separately 10 µl each of solution (1) and solution (2). For solution (1) continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%) and the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the gel containing 50 mg of Miconazole with 25 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 50 ml and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) contains 0.12% w/v of *miconazole nitrate BPCRS* in *methanol*. Solution (3) contains 0.0025% w/v each of *miconazole nitrate BPCRS* and *econazole nitrate BPCRS* in *methanol*.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to miconazole and econazole is at least 10.

Calculate the content of $C_{18}H_{14}Cl_4N_2O$ in the gel using the declared content of $C_{18}H_{14}Cl_4N_2O$ in *miconazole nitrate BPCRS*.

STORAGE

Miconazole Oromucosal Gel should be protected from light.

Midazolam Injection

General Notices

Action and use

Benzodiazepine.

DEFINITION

Midazolam Injection is a sterile solution of Midazolam in Water for Injections containing Hydrochloric Acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of midazolam, $C_{18}H_{13}ClFN_3$

95.0% to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume of the injection containing 20 mg of Midazolam add sufficient 5M *ammonia* to make the solution just alkaline, extract with two 10 ml quantities of *dichloromethane*, dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of midazolam *(RS 235)*.

B. In the test for Related substances, the chromatogram obtained with solution (1) shows a peak with the same retention time as that due to Midazolam in the chromatogram obtained with solution (3).

TESTS

Acidity

pH, 2.9 to 3.7, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Allow all the solutions to stand protected from light for at least 2 hours before testing. For solution (1) dilute a volume of the injection containing 10 mg of Midazolam to 20 ml with the mobile phase. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the mobile phase. Solution (3) contains 0.001% w/v each of N-*desalkylflurazepam BPCRS* and *midazolam BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher RP-18 non-endcapped is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 28 volumes of solution A prepared as described below and 72 volumes of *methanol* and (c) a detection wavelength of 220 nm. Maintain the temperature of the column at 40°. To prepare solution A mix equal volumes of 0.1M *orthophosphoric acid* and 0.03M *triethylamine* and adjust the pH to 3.5 by the addition of 0.1M *sodium hydroxide*.

For solution (1) allow the chromatography to continue for 3 times the retention time of the principal peak. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to midazolam and *N*-desalkylflurazepam is at least 3.0.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Allow all the solutions to stand protected from light for at least 2 hours before testing. For solution (1) dilute a volume of the injection containing 10 mg of Midazolam to 100 ml with the mobile phase. Solution (2) contains 0.01% w/v of *midazolam BPCRS* in the mobile phase. Solution (3) contains 0.001% w/v each of N-*desalkylflurazepam BPCRS* and *midazolam BPCRS* in the mobile phase.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to midazolam and *N*-desalkylflurazepam is at least 3.0.

Calculate the content of $C_{18}H_{13}ClFN_3$ in the injection using the declared content of $C_{18}H_{13}ClFN_3$ in *midazolam BPCRS*.

STORAGE

Midazolam Injection should be protected from light.

Minocycline Tablets

General Notices

Action and use

Tetracycline antibacterial.

DEFINITION

Minocycline Tablets contain Minocycline Hydrochloride Dihydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of minocycline, $C_{23}H_{27}N_3O_7$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing the equivalent of 10 mg of minocycline with 20 ml of *methanol*, centrifuge and use the supernatant liquid.

(2) 0.05% w/v of *minocycline hydrochloride EPCRS* in *methanol*.

(3) 0.05% w/v of each of *minocycline hydrochloride EPCRS* and *doxycycline hyclate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel GF*$_{254}$ as the coating substance. Adjust the pH of a 10.0% w/v solution of *disodium edetate* to 9.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 ml for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Dry the plate at 110° for 1 hour immediately before use.

(b) The mobile phase is a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane.*

(c) Develop to 15 cm.

(d) Application volume of 2 µl for each solution.

(e) After removal of the plate, dry it in a current of air and examine under *ultraviolet light (254 nm)*.

VALIDITY

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Shake a quantity of the powdered tablets containing the equivalent of 50 mg of minocycline with 5 ml of *water* and filter. The filtrate yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter, discarding the first few ml of filtrate. Dilute the filtered solution, if necessary, with 0.1M *hydrochloric acid* to give a solution expected to contain the equivalent of about 0.001% w/v of minocycline. Measure the *absorbance* of the solution at the maximum at 348 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of minocycline, $C_{23}H_{27}N_3O_7$, in the medium from the *absorbance* obtained from a 0.001% w/v solution of *minocycline hydrochloride EPCRS* in 0.1M *hydrochloric acid* and using the declared content of $C_{23}H_{27}N_3O_7$,HCl in *minocycline hydrochloride EPCRS*. Each mg of $C_{23}H_{27}N_3O_7$,HCl is equivalent to 0.9261 mg of $C_{23}H_{27}N_3O_7$.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light. Store the solutions at a temperature of 2° to 8° and use within 3 hours of preparation.

(1) Shake a quantity of the powdered tablets containing the equivalent of 25 mg of minocycline with 50 ml of *water*, dilute to 100 ml with the same solvent and filter.

(2) Dilute 1 volume of solution (1) to 50 volumes with *water*.

(3) Dilute 1.2 volumes of solution (1) to 100 volumes with *water*.

(4) Dissolve 10 mg of *minocycline hydrochloride EPCRS* in *water* and evaporate to dryness on a water bath. Dissolve the residue in 10 ml of mobile phase and add sufficient mobile phase to produce 25 ml.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (20 cm × 4.6 mm) packed with end-capped *octylsilyl silica gel for chromatography* (5 µm) (Nucleosil C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 280 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 25 volumes of a 0.4% w/v solution of *sodium edetate*, 27 volumes of *dimethylformamide* and 50 volumes of a 2.8% w/v solution of *ammonium oxalate*, adjusted to pH 7.0 using a 10.4% w/v solution of *tetrabutylammonium hydroxide*.

For solution (1) allow the chromatography to proceed for 1.5 times the retention time of minocycline.

When the chromatograms are recorded using the prescribed conditions the retention time of minocycline is about 15 minutes. The chromatogram obtained with solution (3) shows a peak with a retention time relative to minocycline of about 0.8 [4-epiminocycline (Ph.Eur. impurity A)].

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to minocycline and 4-epiminocycline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak due to 4-epiminocycline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%);

— the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1.2%);

— the sum of the areas of any such peaks is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, protected from light. Store the solutions at a temperature of 2° to 8° and use within 3 hours of preparation.

(1) Shake a quantity of the powdered tablets containing the equivalent of 25 mg of minocycline with 50 ml of water, dilute to 100 ml with the same solvent, filter and dilute 10 ml of the filtrate to 20 ml with water.

(2) 0.0125% w/v of *minocycline hydrochloride EPCRS* in *water*.

(3) Dissolve 10 mg of *minocycline hydrochloride EPCRS* in *water* and evaporate to dryness on a water bath. Dissolve the residue in 10 ml of mobile phase and add sufficient mobile phase to produce 25 ml.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

When the chromatograms are recorded using the prescribed conditions the retention time of minocycline is about 15 minutes. The chromatogram obtained with solution (3) shows a peak with a retention time relative to minocycline of about 0.8 [4-epiminocycline (Ph.Eur. impurity A)].

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{27}N_3O_7$ in the tablets from the chromatograms obtained and using the declared content of $C_{23}H_{27}N_3O_7$,HCl in *minocycline hydrochloride EPCRS*. Each mg of $C_{23}H_{27}N_3O_7$,HCl is equivalent to 0.9261 mg of $C_{23}H_{27}N_3O_7$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of minocycline.

Minoxidil Scalp Application

General Notices

Action and use

Vasodilator; treatment of hypertension; male pattern baldness.

DEFINITION

Minoxidil Scalp Application is a *cutaneous solution* of Minoxidil in a suitable ethanolic solvent. *The scalp application complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.*

Content of minoxidil, $C_9H_{15}N_5O$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

Evaporate a volume of the scalp application containing about 50 mg of Minoxidil to dryness at a temperature of about 50^{c} under a stream of nitrogen. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of minoxidil *(RS 376)*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of the scalp application with the mobile phase to produce a solution containing 0.025% w/v of Minoxidil. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) add 1 ml of solution (1) to 10 ml of a 0.0025% w/v solution of *deoxyminoxidil EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 10 µm is suitable), (b) as the mobile phase at a flow rate of 1 ml per minute, 3.0 g of *docusate sodium* in a mixture of 10 ml of *glacial acetic acid*, 300 ml of *water* and 700 ml of *methanol*, adjusting the pH of the resulting solution to 3.0 with *perchloric acid* and (c) a detection wavelength of 240 nm. Record the chromatogram obtained with solution (1) for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to minoxidil and deoxyminoxidil is at least 2.0.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) prepare a solution containing 0.025% w/v of Minoxidil by serial dilution of the scalp application with the mobile phase. Solution (2) contains 0.025% w/v of *minoxidil BPCRS* in the mobile phase. Solution (3) contains 0.025% w/v of *deoxyminoxidil EPCRS* in solution (1).

The chromatographic procedure may be carried out as described under Related substances but using a detection wavelength of 254 nm.

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to minoxidil and deoxyminoxidil is at least 2.0.

Calculate the content of $C_9H_{15}N_5O$ in the scalp application using the declared content of $C_9H_{15}N_5O$ in *minoxidil BPCRS*.

LABELLING

The label indicates the pharmaceutical form as 'cutaneous solution'.

Mitobronitol Tablets

General Notices

Action and use

Cytotoxic.

DEFINITION

Mitobronitol Tablets contain Mitobronitol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of mitobronitol, $C_6H_{12}Br_2O_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.5 g of Mitobronitol with 10 ml of hot *methanol*, filter and allow the filtrate to cool. The crystalline precipitate, after filtering and drying at 105° for 2 hours, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of mitobronitol *(RS 236)*.

B. Dissolve 0.1 g in 10 ml of 1M *sodium hydroxide*, boil, cool, acidify with 2M *nitric acid* and add 1 ml of *silver nitrate solution*. A pale yellow, curdy precipitate is produced.

TESTS

Ionic halide

Shake a quantity of powdered tablets containing 1 g of Mitobronitol with 50 ml of *water* for 15 minutes, dilute to 100 ml with *water* and filter. To 50 ml of the filtrate add 10 ml of 2M *nitric acid* and 5 ml of 0.01M *silver nitrate VS* and mix. Titrate the excess of silver nitrate with 0.01M *ammonium thiocyanate VS* using *ammonium iron(III) sulphate solution R2* as indicator. Not more than 3.2 ml of 0.01M *silver nitrate VS* is required.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.2 g of Mitobronitol add 40 ml of 0.5M *sodium hydroxide*, heat to boiling, cool, add 25 ml of 0.1M *silver nitrate VS*, acidify with 5 ml of 5M *nitric acid* and titrate the excess of silver nitrate with 0.1M *ammonium thiocyanate VS* determining the end point potentiometrically. Each ml of 0.1M *silver nitrate VS* is equivalent to 15.40 mg of $C_6H_{12}Br_2O_4$.

STORAGE

Mitobronitol Tablets should be protected from light.

Mitoxantrone Intravenous Infusion

General Notices

Action and use

Cytotoxic.

DEFINITION

Mitoxantrone Intravenous Infusion is a sterile solution of Mitoxantrone Hydrochloride. It is prepared immediately before use by diluting Sterile Mitoxantrone Concentrate with a suitable diluent in accordance with the manufacturer's instructions.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the intravenous infusion, if necessary, with *water BET* to give a solution containing the equivalent of 2 mg of mitoxantrone per ml (solution A). The endotoxin limit concentration of solution A is 10 IU per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

LABELLING

The strength is stated in terms of the equivalent amount of mitoxantrone in a suitable dose-volume.

STERILE MITOXANTRONE CONCENTRATE

DEFINITION

Sterile Mitoxantrone Concentrate is a sterile solution of Mitoxantrone Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of mitoxantrone, $C_{22}H_{28}N_4O_6$

90.0 to 105.0% of the stated amount.

CHARACTERISTICS

A dark blue solution.

IDENTIFICATION

A. Dilute a volume of the concentrate containing the equivalent of 2 mg of mitoxantrone to about 100 ml with *water* and add 20 ml of 1M *hydrochloric acid* and sufficient *water* to produce 200 ml. The *light absorption* of the solution, Appendix II B, in the range 220 nm to

350 nm shows a maximum at about 240 nm and a shoulder at 274 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a solution diluted, if necessary, with *water* to contain the equivalent of 0.2% w/v of mitoxantrone, 3.0 to 4.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the concentrate containing the equivalent of 20 mg of mitoxantrone to 50 ml with the mobile phase. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.2% w/v of *mitoxantrone impurity A EPCRS* and 0.04% w/v of *mitoxantrone hydrochloride EPCRS* in the mobile phase. For solution (4) dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with particles of silica the surface of which has been coated with chemicallybonded phenyl groups (10 µm) (µBondapak Phenyl is suitable), (b) as the mobile phase with a flow rate of 3 ml per minute a mixture of 750 volumes of *water*, 250 volumes of *acetonitrile* and 25 volumes of a solution prepared by dissolving 22 g of *sodium heptanesulphonate* in about 150 ml of *water*, filtering through a 0.45-µm filter, washing the filter with *water,* adding 32 ml of *glacial acetic acid* to the combined filtrate and washings and diluting to 250 ml with *water* and (c) a detection wavelength of 254 nm.

Inject separately 50 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

Record the chromatogram obtained with solution (1) for three times the retention time of the principal peak. In the chromatogram obtained, the area of any peak with a retention time of 1.69 relative to mitoxantrone (impurity D) is not greater than three times the area of the peak in the chromatogram obtained with solution (2) (3%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any *secondary peaks* other than any peak corresponding to mitoxantrone impurity D is not greater than five times the area of the peak in the chromatogram obtained with solution (2) (5%). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the concentrate containing the equivalent of 20 mg of mitoxantrone to 50 µl with the mobile phase. Solution (2) contains 0.04% w/v of *mitoxantrone hydrochloride EPCRS* in the mobile phase. Solution (3) contains 0.2% w/v of *mitoxantrone impurity A EPCRS* in solution (2).

The chromatographic procedure described under Related substances may be used.

Inject separately 50 µl of each solution. The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

Calculate the content of $C_{22}H_{28}N_4O_6$ from the peak areas in the chromatograms obtained using the declared content of $C_{22}H_{30}Cl_2N_4O_6$ in *mitoxantrone hydrochloride EPCRS* and taking each mg of $C_{22}H_{30}Cl_2N_4O_6$ to be equivalent to 0.8951 mg of $C_{22}H_{28}N_4O_6$.

LABELLING

The label states the concentration in terms of the equivalent amount of mitoxantrone in a suitable volume.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Mitoxantrone Hydrochloride.

Mometasone Aqueous Nasal Spray

General Notices

Action and use

Glucocorticoid.

DEFINITION

Mometasone Aqueous Nasal Spray is an aqueous suspension of Mometasone Furoate in a suitable pressurised container fitted with an appropriate nasal delivery system.

The nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of mometasone furoate, $C_{27}H_{30}Cl_2O_6$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. In the test for Related substances the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to the peak due to mometasone furoate in the chromatogram obtained with solution (5).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Discharge the container a sufficient number of times to obtain 1 mg of Mometasone Furoate, add 4 ml of *acetone*, mix with the aid of ultrasound and filter. Evaporate the filtrate to dryness and dissolve in 1 ml of *acetone*.

(2) 0.002% w/v of *mometasone furoate BPCRS* in *acetone*.

(3) Dilute 1 volume of solution (2) to 2 volumes with *acetone*.

(4) Dilute 1 volume of solution (2) to 4 volumes with *acetone*.

(5) 0.1% w/v of *mometasone furoate BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) 3 volumes of *methanol* and 97 volumes of *1,2-dichloroethane* as the mobile phase.

(c) Application volume of 50 µl for each solution.

(d) After removal of the plate, allow it to dry in air, spray with *alkaline tetrazolium blue solution* and heat at 50° for 5 minutes. Cool and spray again with *alkaline tetrazolium blue solution*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (4) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) discharge the container a sufficient number of times to obtain 1 mg of Mometasone Furoate, add 20 ml of hot *methanol (90%)* and add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80%)*. Repeat the extraction of the *2,2,4-trimethylpentane* layer with two further 10 ml quantities of *methanol (80%)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80%)* to produce 50 ml. Flter through a 0.45 µm nylon filter (Millipore Millex-HN is suitable).

(2) 0.002% w/v of *mometasone furoate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC PROCEDURE

(a) Stainless steel column (10 cm × 5 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 60°.

(e) Detection wavelength of 238 nm.

(f) Injection volume of 20 µl.

MOBILE PHASE

A mixture of 45 volumes of *water* and 55 volumes of *methanol*.

SYSTEM SUITABILITY

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to mometasone furoate is about 9 minutes.

The test is not valid unless the *symmetry factor* of the peak due to mometasone furoate is not more than 1.2.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the preparation being examined using the declared content of $C_{27}H_{30}Cl_2O_6$ in *mometasone furoate BPCRS*.

LABELLING

The label states the amount of active ingredient delivered by each actuation of the valve and the number of deliveries available from the container.

Mometasone Cream

General Notices

Action and use

Glucocorticoid.

DEFINITION

Mometasone Cream contains Mometasone Furoate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of mometasone furoate, $C_{27}H_{30}Cl_2O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the cream containing 0.5 mg of Mometasone Furoate in 20 ml of *methanol (80%)* by heating on a water bath until the solution begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *dichloromethane*, shake vigorously, allow the layers to separate, evaporate the *dichloromethane* layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 ml of *dichloromethane*.

(2) 0.025% w/v of *mometasone furoate BPCRS* in *dichloromethane*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase.

(c) Application volume of 10 µl for each solution.

(d) After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and, while hot, spray with *alcoholic sulphuric acid solution* and heat at 105° for a further 5 minutes.

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to mometasone furoate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing 1 mg of Mometasone Furoate in 20 ml of hot *methanol (90%)*, add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80%)*. Repeat the extraction of the *2,2,4-trimethylpentane* layer with two further 10 ml quantities of *methanol (80%)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80%)* to produce 50 ml. Flter through a 0.45 µm nylon filter (Millipore Millex-HN is suitable).

(2) 0.002% w/v of *mometasone furoate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC PROCEDURE

(a) Stainless steel column (10 cm × 5 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 60°.

(e) Detection wavelength of 238 nm.

(f) Injection volume of 20 µl.

MOBILE PHASE

A mixture of 45 volumes of *water* and 55 volumes of *methanol*.

SYSTEM SUITABILITY

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to mometasone furoate is about 9 minutes.

The test is not valid unless the *symmetry factor* of the peak due to mometasone furoate is not more than 1.2.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the preparation being examined using the declared content of $C_{27}H_{30}Cl_2O_6$ in *mometasone furoate BPCRS*.

STORAGE

Mometasone Cream should be protected from light.

Mometasone Ointment

General Notices

Action and use

Glucocorticoid.

DEFINITION

Mometasone Ointment contains Mometasone Furoate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of mometasone furoate, $C_{27}H_{30}Cl_2O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing 0.5 mg of Mometasone Furoate in 20 ml of *methanol (80%)* by heating on a water bath until the solution begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *dichloromethane*, shake vigorously, allow the layers to separate, evaporate the *dichloromethane* layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 ml of *dichloromethane*.

(2) 0.025% w/v of *mometasone furoate BPCRS* in *dichloromethane*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase.

(c) Apply to the plate 10 µl of solutions (1), (2) and (3).

(d) After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and, while hot, spray with *alcoholic sulphuric acid solution* and heat at 105° for a further 5 minutes.

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to mometasone furoate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 1 mg of Mometasone Furoate in 20 ml of hot *methanol (90%)*, add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80%)*. Repeat the extraction of the *2,2,4-trimethylpentane* layer with two further 10 ml quantities of *methanol (80%)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80%)* to produce 50 ml. Flter through a 0.45 µm nylon filter (Millipore Millex-HN is suitable).

(2) 0.002% w/v of *mometasone furoate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (10 cm × 5 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 60°.

(e) Detection wavelength of 238 nm

(f) Injection volume of 20 µl.

MOBILE PHASE

A mixture of 45 volumes of *water* and 55 volumes of *methanol*.

SYSTEM SUITABILITY

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to mometasone furoate is about 9 minutes.

The test is not valid unless the *symmetry factor* of the peak due to mometasone furoate is not more than 1.2.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the preparation being examined using the declared content of $C_{27}H_{30}Cl_2O_6$ in *mometasone furoate BPCRS*.

STORAGE

Mometasone Ointment should be protected from light.

Mometasone Scalp Application

General Notices

Action and use

Glucocorticoid.

DEFINITION

Mometasone Scalp Application is a cutaneous suspension of Mometasone Furoate in a suitable liquid basis.

The scalp application complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of mometasone furoate, $C_{27}H_{30}Cl_2O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the scalp application containing 0.5 mg of Mometasone Furoate in 20 ml of *methanol (80%)* by heating on a water bath until the solution begins to boil. Shake vigorously, cool in ice for 30 minutes and centrifuge. Mix 10 ml of the supernatant liquid with 3 ml of *water* and 5 ml of *dichloromethane*, shake vigorously, allow the layers to separate, evaporate the *dichloromethane* layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 1 ml of *dichloromethane*.

(2) 0.025% w/v of *mometasone furoate BPCRS* in *dichloromethane*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) 5 volumes of *absolute ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase.

(c) Application volume of 10 µl for each solution.

(d) After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and, while hot, spray with *alcoholic sulphuric acid solution* and heat at 105° for a further 5 minutes.

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to mometasone furoate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the scalp application containing 1 mg of Mometasone Furoate in 20 ml of hot *methanol (90%)*, add 25 ml of *2,2,4-trimethylpentane*, cool, shake the mixture and filter the lower methanol layer through a small plug of absorbent cotton previously washed with *methanol (80%)*. Repeat the extraction of the *2,2,4-trimethylpentane* layer with two further 10 ml quantities of *methanol (80%)*, filtering the extracts through the absorbent cotton. Combine the extracts and add sufficient *methanol (80%)* to produce 50 ml.

(2) 0.002% w/v of *mometasone furoate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC PROCEDURE

(a) Stainless steel column (10 cm × 5 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Column temperature of 60°.

(e) Detection wavelength of 238 nm.

(f) Injection volume of 20 µl.

MOBILE PHASE

A mixture of 45 volumes of *water* and 55 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to mometasone furoate is about 9 minutes.

SYSTEM SUITABILITY

The test is not valid unless the *symmetry factor* of the peak due to mometasone furoate is not more than 1.2.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{30}Cl_2O_6$ in the preparation being examined using the declared content of $C_{27}H_{30}Cl_2O_6$ in *mometasone furoate BPCRS*.

STORAGE

Mometasone Scalp Application should be protected from light.

LABELLING

The label indicates the pharmaceutical form as 'cutaneous suspension'.

Morphine and Atropine Injection

General Notices

Action and use

Opioid receptor agonist; analgesic; anticholinergic.

DEFINITION

Morphine and Atropine Injection is a sterile isotonic solution containing 1.0% w/v of Morphine Sulphate and 0.06% w/v of Atropine Sulphate in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$

0.054 to 0.066% w/v.

Content of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$

0.92 to 1.07% w/v.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 3 volumes of 13.5M *ammonia* and 200 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add 1 ml of 5M *ammonia* to 1 ml of the injection, extract with two 5 ml quantities of *chloroform*, filter the combined extracts through *anhydrous sodium sulphate*, evaporate to dryness in a current of warm air and dissolve the residue in 0.5 ml of *chloroform*. For solution (2) treat 1 ml of a 0.06% w/v solution of *atropine sulphate BPCRS* in the same manner as for solution (1). For solution (3) treat 1 ml of a 1% w/v solution of *morphine sulphate BPCRS* in the same manner as for solution (1). After removal of the plate, allow it to dry in a current of air and spray with *dilute potassium iodobismuthate solution*. The spots in the chromatogram obtained with solution (1) correspond to the spots in the chromatograms obtained with solutions (2) and (3).

B. In the Assay for atropine sulphate, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

C. In the Assay for morphine sulphate, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel plates are suitable) and a freshly prepared mixture of 2.5

volumes of 18M *ammonia*, 32.5 volumes of *acetone*, 35 volumes of *ethanol (70%)* and 35 volumes of *toluene* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute the injection, if necessary, with a mixture of equal volumes of *ethanol (96%)* and *water* to produce a solution containing 1% w/v of Morphine Sulphate. For solution (2) dissolve 50 mg of *codeine phosphate* in 5 ml of solution (1) and dilute 1 volume of the resulting solution to 200 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*. Solution (4) contains 0.06% w/v of *atropine sulphate* in a mixture of equal volumes of *ethanol (96%)* and *water*. After removal of the plate, dry it in a current of air, spray with *potassium iodobismuthate solution*, dry for 15 minutes in a current of air and spray with *hydrogen peroxide solution (10 vol)*. Examine the plates immediately. In the chromatograms obtained with solutions (1) and (2) the spots due to codeine are bluish-grey and the spots due to morphine are pinkish. In the chromatogram obtained with solution (1) any spot corresponding to codeine is not more intense than the spot due to codeine in the chromatogram obtained with solution (2) (0.5%), any other *secondary spot* is not more intense than the spot due to morphine in the chromatogram obtained with solution (2) (0.5%) and not more than two such spots are more intense than the spot due to morphine in the chromatogram obtained with solution (3) (0.2%). Disregard the spot in the chromatogram obtained with solution (1) which corresponds to the spot for atropine sulphate in the chromatogram obtained with solution (4). The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

ASSAY

For atropine sulphate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection being examined. Solution (2) contains 0.06% w/v of *atropine sulphate BPCRS* in *methanol (60%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 0.01M *sodium acetate* and 0.005M *dioctyl sodium sulphosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid* and (c) a detection wavelength of 257 nm.

Calculate the content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ using the declared content of $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in *atropine sulphate BPCRS*.

For morphine sulphate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 1 volume of the injection to 10 volumes with *methanol (60%)*. Solution (2) contains 0.1% w/v of *morphine sulphate BPCRS* in *methanol (60%)*.

The chromatographic procedure described under Assay for atropine sulphate may be used but with a detection wavelength of 285 nm.

Calculate the content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ using the declared content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ in *morphine sulphate BPCRS*.

Morphine Sulphate Injection

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Morphine Sulphate Injection is a sterile solution of Morphine Sulphate in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$

92.5 to 107.5% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

B. Evaporate a volume containing 5 mg of Morphine Sulphate to dryness on a water bath. Dissolve the residue in 5 ml of *water* and add 0.15 ml of *dilute potassium hexacyanoferrate (III) solution* and 0.05 ml of *iron(III) chloride solution R1*. A bluish-green colour is produced immediately, which changes rapidly to blue.

C. Yields reaction A characteristic of *sulphates*, Appendix VI.

TESTS

Related substances

Complies with the test described under Morphine Suppositories but using the following solutions. For solution (1) dilute the injection, if necessary, with a mixture of equal volumes of *ethanol (96%)* and *water* to produce a solution containing 1% w/v of Morphine Sulphate. For solution (2) dissolve 50 mg of *codeine phosphate* in 5 ml of solution (1) and dilute 1 volume of the resulting solution to 200 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*.

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots. Disregard any spot with an Rf value of less than 0.1.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For solution (1) dilute the injection to contain 0.1% w/v of Morphine Sulphate with *methanol (60%)*. Solution (2) contains 0.1% w/v of *morphine sulphate BPCRS* in *methanol (60%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 0.01M *sodium acetate* and 0.005M *dioctyl sodium sulphosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid* and (c) a detection wavelength of 285 nm.

Calculate the content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ using the declared content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ in *morphine sulphate BPCRS*.

STORAGE

Morphine Sulphate Injection should be protected from light.

Morphine Suppositories

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Morphine Suppositories contain Morphine Hydrochloride or Morphine Sulphate in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of morphine

As the hydrochloride, $C_{17}H_{19}NO_3,HCl,3H_2O$, or as the sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$, 95.0 to 105.0% of the stated amount.

IDENTIFICATION

Dissolve a quantity of the suppositories containing 90 mg of Morphine Hydrochloride or Morphine Sulphate in 25 ml of *chloroform*, extract with 50 ml of 0.01M *hydrochloric acid* and wash the aqueous layer with two 20 ml quantities of *chloroform*. Make the aqueous layer alkaline with *ammonia buffer pH 10.0* and extract with two 40 ml quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol* . Dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of morphine *(RS 237)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck plates are suitable) and a mixture of 2.5 volumes of 13.5M *ammonia*, 32.5 volumes of *acetone*, 35 volumes of *ethanol (70%)* and 35 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) disperse a quantity of the mixed suppositories prepared for the Assay containing 0.1 g of Morphine Hydrochloride or Morphine Sulphate in 10 ml of hot *water*, mix vigorously, allow to cool until the mass sets and filter the lower, aqueous layer. For solution (2) dissolve 50 mg of *codeine phosphate* in 5 ml of solution (1) and dilute 1 volume of the resulting solution to 200 volumes with *water*. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with *water*. After removal of the plate, dry it in a current of air, spray with *potassium iodobismuthate solution*, dry for 15 minutes in a current of air and spray with *hydrogen peroxide solution (10 vol)*. The spot due to codeine is bluish-grey and the spot due to morphine is pinkish. In the chromatogram obtained with solution (1) any spot corresponding to codeine is not more intense than the spot due to codeine in the chromatogram obtained with solution (2) (0.5%), any other *secondary spot* is not more intense than the spot due to morphine in the chromatogram obtained with solution (2) (0.5%) and not more than two such spots are more intense than the spot due to morphine in the chromatogram obtained with solution (3) (0.2%).

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 30 mg of *morphine sulphate BPCRS* in 60 ml of 0.01M *hydrochloric acid*, add 20 ml of 0.3M *dipotassium hydrogen orthophosphate* and dilute to 100 ml with *water*. For solution (2) weigh 10 suppositories, melt together by warming and allow to cool, stirring continuously until the mass has set. Dissolve a quantity containing 30 mg of Morphine Hydrochloride or Morphine Sulphate in 25 ml of *chloroform*, extract with two quantities of 40 ml and 20 ml of 0.01M *hydrochloric acid*, wash the combined aqueous layers with two 20 ml quantities of *chloroform*, add 20 ml of 0.3M *dipotassium hydrogen orthophosphate* and dilute to 100 ml with *water*. Solution (3) contains 0.03% w/v of *morphine sulphate BPCRS* and 0.04% w/v of *codeine phosphate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute, a solution containing 0.22% w/v of *dioctyl sodium sulphosuccinate* and 0.14% w/v of *sodium acetate* in a mixture of 60 volumes of *methanol* and 40 volumes of *water*, the pH of the solution being adjusted to 5.5 with *glacial acetic acid*, and (c) a detection wavelength of 285 nm.

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to morphine and codeine is at least 2.0.

Calculate the content of $C_{17}H_{19}NO_3,HCl,3H_2O$ or $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$, as appropriate, using the declared content of $C_{17}H_{19}NO_3$ in *morphine sulphate BPCRS*. Each g of $C_{17}H_{19}NO_3$ is equivalent to 1.317 g of $C_{17}H_{19}NO_3,HCl,3H_2O$ or 1.330 g of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

LABELLING

The label states the quantity of Morphine Hydrochloride or of Morphine Sulphate in each suppository.

Morphine Tablets

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Morphine Tablets contain Morphine Sulphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 20 mg of Morphine Sulphate with 5 ml of *water*, filter and add to the filtrate 0.05 ml of *iron(III) chloride solution R1*. A blue colour is produced.

B. Extract a quantity of the powdered tablets containing 10 mg of Morphine Sulphate with 10 ml of *water*, filter and to 5 ml of the filtrate add 0.15 ml of *dilute potassium hexacyanoferrate (III) solution* and 0.05 ml of *iron(III) chloride solution R1*. A bluish-green colour is produced immediately which changes rapidly to blue.

C. The powdered tablets yield the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *phosphate buffer pH 6.5* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.001% w/v of *morphine sulphate BPCRS* in *phosphate buffer pH 6.5*. Solution (2) is the filtered dissolution medium, diluted with *phosphate buffer pH 6.5*, if necessary, to produce a solution containing about 0.001% w/v of Morphine Sulphate.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) a mixture of 50 volumes of *methanol* and 50 volumes of 0.01M *sodium heptanesulphonate* in 0.1M *acetic acid* as the mobile phase with a flow rate of 2.0 ml per minute and (c) a detection wavelength of 211 nm.

Inject 50 µl of each solution. Calculate the total content of morphine sulphate, $(C_{17}H_{19}NO_3)_2$, $H_2SO_4,5H_2O$, in the medium using the declared content of $C_{17}H_{19}NO_3$ in *morphine sulphate*

BPCRS. Each g of $C_{17}H_{19}NO_3$ is equivalent to 1.330 g of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

Related substances

Complies with the test described under Morphine Suppositories but using 50 µl of each of the following solutions. For solution (1) remove any coating from the tablets and shake a quantity of the powdered tablet cores containing 10 mg of Morphine Sulphate with 10 ml of a mixture of *ethanol (96%)* and *water* for 10 minutes and filter. For solution (2) dissolve 5 mg of *codeine phosphate* in 5 ml of solution (1) and dilute 1 volume of the resulting solution to 200 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*.

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots. Disregard any spot with an Rf value of less than 0.1.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of Morphine Sulphate with 25 ml of *water* and 5 ml of 1M *sodium hydroxide*, add 1 g of *ammonium sulphate*, shake to dissolve, add 20 ml of *ethanol (96%)* and extract with successive quantities of 40, 20, 20 and 20 ml of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol (96%)*. Wash each extract with the same 5 ml of *water*, filter and evaporate the solvent. Dissolve the residue in 10 ml of 0.05M *hydrochloric acid VS*, boil, cool, add 15 ml of *water* and titrate the excess of acid with 0.05M *sodium hydroxide VS* using *methyl red solution* as indicator. Each ml of 0.05M *hydrochloric acid VS* is equivalent to 18.97 mg of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$.

STORAGE

Morphine Tablets should be protected from light.

Moxisylyte Tablets

General Notices

Action and use

Alpha-adrenoceptor antagonist.

DEFINITION

Moxisylyte Tablets contain Moxisylyte Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of moxisylyte, $C_{16}H_{25}NO_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing the equivalent of 20 mg of moxisylyte with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of moxisylyte hydrochloride *(RS 238)*.

B. Dilute 20 ml of a 0.03% w/v solution to 100 ml with *water* (solution A). Dilute a further 20 ml of the same solution to 100 ml with 0.1M *sodium hydroxide* (solution B). The ratio of the *absorbance* of solution B at 302 nm, measured 30 minutes after preparation, to that of solution A at 275 nm is about 1.7, Appendix II B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0040% w/v of *2-(6-hydroxythymoxy)ethyldimethylamine hydrochloride BPCRS* and 0.00050% w/v of *2-thymoxyethyldimethylamine hydrochloride BPCRS* in the mobile phase. For solution (2) shake a quantity of the powdered tablets containing the equivalent of 0.18 g of moxisylyte with 100 ml of the mobile phase for 15 minutes, centrifuge and use the clear supernatant liquid. For solution (3) dilute 1 volume of solution (2) to 100 volumes with the mobile phase. For solution (4) dilute 1 volume of solution (3) to 10 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) 0.005M *sodium hexanesulphonate* in a mixture of 2 volumes of *glacial acetic acid*, 185 volumes of *water* and 315 volumes of *methanol* as the mobile phase with a flow rate of 1.0 ml per minute and (c) a detection wavelength of 276 nm.

The peaks in the chromatogram obtained with solution (1) are due to (a) 2-(6-hydroxythymoxy)ethyldimethylamine hydrochloride and (b) 2-thymoxyethyldimethylamine hydrochloride in order of their elution. In the chromatogram obtained with solution (2) the areas of any peaks corresponding to (a) and (b) are not greater than the areas of the corresponding peaks in the chromatogram obtained with solution (1) (2% of 2-(6-hydroxythymoxy)ethyldimethylamine hydrochloride and 0.25% of 2-thymoxyethyldimethylamine hydrochloride respectively), the area of any peak with a retention time relative to moxisylyte of 2.3 is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1% of 2-(6-chlorothymoxy)-ethyldimethylamine hydrochloride) and the area of any peak with a retention time relative to moxisylyte of 0.9 is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.1% of 2-(6-acetylthymoxy)ethyldimethylamine).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 13 mg of moxisylyte with 150 ml of 0.1M *hydrochloric acid*, add sufficient 0.1M *hydrochloric acid* to produce 250 ml and filter. Measure the *absorbance* of the filtrate at the maximum at 275 nm, Appendix II B. Calculate the content of $C_{16}H_{25}NO_3$ taking 79.7 as the value of *A* (1%, 1 cm) at the maximum at 275 nm.

STORAGE

Moxisylyte Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of moxisylyte.

40 mg of moxisylyte is equivalent to 45.2 mg of Moxisylyte Hydrochloride.

Mupirocin Cream

General Notices

Action and use

Antibacterial.

DEFINITION

Mupirocin Cream contains Mupirocin Calcium in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of mupirocin, $C_{26}H_{44}O_9$

90.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the cream containing the equivalent of 100 mg of mupirocin in a mixture of 20 ml of *dichloromethane* and 4 ml of 0.2M *sodium borate buffer pH 8.4,* with shaking, and centrifuge at 3000 revolutions per minute until separate layers are obtained. The upper layer (which may be cloudy) is separated from the lower layer by a band of creamy solid. Remove and retain the upper aqueous layer and re-extract the lower layer with a further 4 ml of 0.2M *sodium borate buffer pH 8.4.* Combine the aqueous extracts, add 10 ml of *dichloromethane* to the combined extracts and centrifuge at 3000 revolutions per minute. Remove the upper layer and adjust the pH to about 4 with 1M *hydrochloric acid* (a slight cloudiness may be observed), add 10 ml of *dichloromethane* and centrifuge. Separate and retain the lower layer; add a further 10 ml of *dichloromethane* to the upper layer and centrifuge. Combine the dichloromethane extracts and evaporate to dryness at room temperature under a current of nitrogen; a jelly-like residue is obtained. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of mupirocin *(RS 425)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 50 mg of mupirocin in 5 ml of a mixture of 3 volumes of *tetrahydrofuran* and 1 volume of *water* and shake mechanically for 15 minutes. Add 5 ml of *acetate buffer pH 4.0* and mix thoroughly. Centrifuge for about 15 minutes; remove the lower layer and filter through a 0.5-µm filter. Dilute 1 ml of this solution to 50 ml with a solution containing equal volumes of *acetate buffer pH 4.0* and a mixture of 3 volumes of *tetrahydrofuran* and 1 volume of *water*, mix and filter through a

0.5-µm filter.

(2) 0.0002% w/v of *mupirocin lithium EPCRS* in 0.1M *phosphate buffer solution pH 6.3*.

(3) A solution containing equal volumes of *acetate buffer pH 4.0* and a mixture of 3 volumes of *tetrahydrofuran* and 1 volume of *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

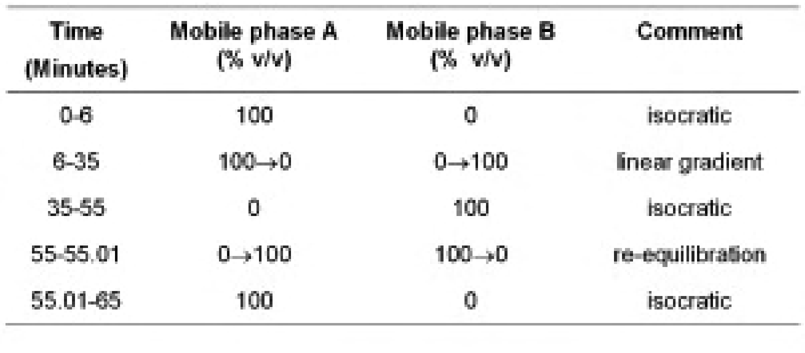
(f) Inject 20 µl of each solution.

MOBILE PHASE

Mobile phase A Dissolve 5.8 g of *glacial acetic acid* in 900 ml of *water*, adjust the pH to 5.7 with *ammonium hydroxide* and add sufficient *water* to produce 1000 ml (0.1M ammonium acetate solution). Mix 25 volumes of *tetrahydrofuran* and 75 volumes of the 0.1M ammonium acetate solution.

Mobile phase B 30 volumes of *tetrahydrofuran* and 70 volumes of 0.1M ammonium acetate solution.

Use the following gradient. Allow the system to equilibrate for 10 minutes at the start.



Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-6	100	0	isocratic
6-35	100→0	0→100	linear gradient
35-55	0	100	isocratic
55-55.01	0→100	100→0	re-equilibration
55.01-65	100	0	isocratic

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is between 19.4 and 23.7 minutes (about 21.5 minutes).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2):

the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.7 (mupirocin impurity C) is at least 3.0;

the *column efficiency*, determined on the peak due to mupirocin, is at least 7000 *theoretical plates* per metre;

the *symmetry factor* of the principal peak is at most 1.75.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to mupirocin impurity C is not greater than 3.2 times the area of the principal peak in the chromatogram obtained with solution (2) (3.2%, with respect to the content of mupirocin);

the area of any peak with a retention time relative to mupirocin of about 0.6 (mupirocin impurity D) is not greater than 8.5 times the area of the principal peak in the chromatogram obtained with solution (2) (8.5%, with respect to the content of mupirocin);

the area of any peak with a retention time relative to mupirocin of about 0.63 (mupirocin impurity E) is not greater than 16 times the area of the principal peak in the chromatogram obtained with solution (2) (16%, with respect to the content of mupirocin);

the area of any other *secondary peak* is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (1.2%, with respect to the content of mupirocin);

the sum of the areas of all the *secondary peaks* is not greater than 30 times the area of the principal peak in the chromatogram obtained with solution (2) (30%, with respect to the content of mupirocin).

Disregard any peaks corresponding to the peaks in the chromatogram obtained with solution (3) and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%, with respect to the content of mupirocin).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 10 mg of mupirocin in 25 ml of *tetrahydrofuran*, add 50 ml of 0.1M *phosphate buffer solution pH 6.3* and shake vigorously. Add sufficient 0.1M *phosphate buffer solution pH 6.3* to produce 100 ml and mix; filter the solution through a 0.5-µm filter and use the filtrate.

(2) 0.01% w/v of *mupirocin lithium EPCRS* in 0.1M *phosphate buffer solution pH 6.3.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

28 volumes of *acetonitrile* and 72 volumes of 0.1M *phosphate buffer solution pH 6.3*.

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is about 5 minutes.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.77 (mupirocin impurity C) is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{44}O_9$ in the cream using the declared content of $C_{26}H_{43}O_9Li$ in *mupirocin lithium EPCRS*. Each mg of $C_{26}H_{43}O_9Li$ is equivalent to 0.9882 mg of $C_{26}H_{44}O_9$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of mupirocin.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Mupirocin Calcium.

Mupirocin Nasal Ointment

General Notices

Action and use

Antibacterial.

DEFINITION

Mupirocin Nasal Ointment contains Mupirocin Calcium in a suitable basis.
The nasal ointment complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of mupirocin, $C_{26}H_{44}O_9$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the nasal ointment containing the equivalent of 100 mg of mupirocin in a mixture of 20 ml of *dichloromethane* and 4 ml of 0.2M *sodium borate buffer pH 8.4,* with shaking, and centrifuge at 3000 revolutions per minute until separate layers are obtained. Remove and retain the upper aqueous layer and re-extract the lower layer with a further 4 ml of 0.2M *sodium borate buffer pH 8.4.* Combine the aqueous extracts, add 10 ml of *dichloromethane* to the combined extracts and centrifuge at 3000 revolutions per minute. Remove the upper aqueous layer and adjust the pH to about 4 with 1M *hydrochloric acid* (a slight cloudiness may be observed), add 10 ml of *dichloromethane* and centrifuge. Separate and retain the lower layer; add a further 10 ml of *dichloromethane* to the upper layer and centrifuge. Combine the dichloromethane extracts and evaporate to dryness at room temperature under a current of nitrogen; a jelly-like residue is obtained. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of mupirocin *(RS 425)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the nasal ointment containing the equivalent of 50 mg of mupirocin in 5 ml of a solution containing 3 volumes of *tetrahydrofuran* and 1 volume of *water* and shake vigorously on a mechanical shaker for 1 hour. Add 5 ml of a solution prepared by dissolving 13.6 g of *sodium acetate* in 1000 ml of *water*, mixing and adjusting the pH to 4.0 with *glacial acetic acid*, shake for a further 15 minutes. Allow the layers to separate and filter the lower aqueous layer (Whatman GF/F filter paper is suitable).

(2) Dilute 1 volume of solution (1) to 50 volumes with a solution containing 3 volumes of

tetrahydrofuran and 1 volume of *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable) fitted with a suitable stainless steel guard column packed with the same material.

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

25 volumes of *tetrahydrofuran* and 75 volumes of a solution prepared by dissolving 7.7 g of *ammonium acetate* in 900 ml of *water*, adjusting the pH to 5.7 with 0.1M *glacial acetic acid* and diluting to 1000 ml with *water.*

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is about 12 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.75 (mupirocin impurity C) is at least 3.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity C is not greater than 4% by *normalisation*;

the area of any other *secondary peak* is not greater than 1% by *normalisation*;

the sum of the areas of all the *secondary peaks* is not greater than 10% by *normalisation*.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the nasal ointment containing the equivalent of 10 mg of mupirocin in 50 ml of a solution containing 3 volumes of *tetrahydrofuran* and 1 volume of *water* and shake vigorously on a mechanical shaker for 1 hour. Add 50 ml of a solution prepared by dissolving 13.6 g of *sodium acetate* in 1000 ml of *water*, mixing and adjusting the pH to 4.0 with *glacial acetic acid*, shake for a further 15 minutes and filter (Whatman GF/F filter paper is suitable).

(2) 0.01% w/v of *mupirocin lithium EPCRS* in a solution containing 3 volumes of *tetrahydrofuran* and 1 volume of *water.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable) fitted with a suitable stainless steel guard column packed with the same material.

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

25 volumes of *tetrahydrofuran* and 75 volumes of a solution prepared by dissolving 7.7 g of *ammonium acetate* in 900 ml of *water*, adjusting the pH to 5.7 with 0.1M *glacial acetic acid* and diluting to 1000 ml with *water.*

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is about 12 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.75 (mupirocin impurity C) is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{44}O_9$ in the nasal ointment using the declared content of $C_{26}H_{43}O_9Li$ in *mupirocin lithium EPCRS*. Each mg of $C_{26}H_{43}O_9Li$ is equivalent to 0.9882 mg of $C_{26}H_{44}O_9$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of mupirocin.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Mupirocin Calcium.

Mupirocin Ointment

General Notices

Action and use

Antibacterial.

DEFINITION

Mupirocin Ointment contains Mupirocin in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of mupirocin, $C_{26}H_{44}O_9$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the ointment containing 50 mg of Mupirocin in 50 ml of 0.1M *phosphate buffer solution pH 6.3*, swirl and allow to stand (with occasional swirling) until dissolution is almost complete. Shake vigorously for 10 minutes and add sufficient 0.1M *phosphate buffer solution pH 6.3* to produce 100 ml. Solution (2) contains 0.00054% w/v of *mupirocin lithium EPCRS* in 0.1M *phosphate buffer solution pH 6.3*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable) fitted with a stainless steel guard column packed with the same material (Novapak C8 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 28 volumes of *tetrahydrofuran* and 72 volumes of a solution prepared by dissolving 7.7 g of *ammonium acetate* in 900 ml of *water*, adjusting the pH to 5.7 with 0.1M *glacial acetic acid* and diluting to 1000 ml with *water* and (c) a detection wavelength of 240 nm.

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is about 13 minutes. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.65 (mupirocin impurity C) is at least 3.5.

In the chromatogram obtained with solution (1): the area of any peak corresponding to mupirocin impurity C is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4%, with respect to the content of mupirocin); the area of any peak with a retention time relative to mupirocin of about 0.5 (mupirocin impurity D) is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%, with respect to the content of mupirocin); the area of any peak with a retention time relative to mupirocin of about 0.55 (mupirocin impurity E) is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (10%, with respect to the content of mupirocin); the area of any other *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%, with respect to the content of mupirocin) and the sum of the areas of all the *secondary peaks* is not greater than 20 times the area of the principal peak in the chromatogram obtained with solution (2) (20%, with respect to the content of mupirocin). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%, with respect to the content of mupirocin).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the ointment containing 50 mg of Mupirocin in 100 ml of 0.1M *phosphate buffer solution pH 6.3*, swirl and allow to stand (with occasional swirling) until dissolution is complete. Add 56 ml of *acetonitrile* and sufficient 0.1M *phosphate buffer solution pH 6.3* to produce 200 ml. Solution (2) contains 0.027% w/v of *mupirocin lithium EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 28 volumes of *acetonitrile* and 72 volumes of 0.1M *phosphate buffer solution pH 6.3* and (c) a detection wavelength of 230 nm.

When the chromatograms are recorded under the prescribed conditions the retention time of mupirocin is about 5 minutes. The assay is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peak due to mupirocin and the peak with a retention time relative to mupirocin of about 0.77 (mupirocin impurity C) is at least 1.5.

Calculate the content of $C_{26}H_{44}O_9$ in the ointment using the declared content of $C_{26}H_{43}O_9Li$ in *mupirocin lithium EPCRS*. Each mg of $C_{26}H_{43}O_9Li$ is equivalent to 0.9882 mg of $C_{26}H_{44}O_9$.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Mupirocin.

Prolonged-release Minocycline Capsules

General Notices

Action and use

Tetracycline antibacterial.

Prolonged-release Minocycline Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Minocycline Capsules contain Minocycline Hydrochloride Dihydrate. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Minocycline Hydrochloride. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of minocycline, $C_{23}H_{27}N_3O_7$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 150 ml of *methanol* to a quantity of the mixed capsule contents containing the equivalent of 0.1 g of minocycline, mix with the aid of ultrasound, add sufficient *methanol* to produce 200 ml and filter (Whatman No. 41 paper is suitable).

(2) 0.05% w/v of *minocycline hydrochloride EPCRS* in *methanol*.

(3) 0.05% w/v of each of *minocycline hydrochloride EPCRS* and *oxytetracycline hydrochloride EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC octadecylsilyl silica gel* F_{254} *plate* (Merck RP18 F_{254S} plates are suitable).

(b) The mobile phase is a mixture of 20 volumes of *acetonitrile*, 20 volumes of *methanol* and 60 volumes of a 6.3% w/v solution of *oxalic acid* previously adjusted to pH 2.0 with *ammonia*.

(c) Develop to 15 cm.

(d) Application volume of 5 µl for each solution.

(e) After removal of the plate allow it to dry in air and examine under *ultraviolet light (254 nm).*

VALIDITY

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light. Store the solutions at a temperature of 2° to 8° and use within 3 hours of preparation.

(1) Add 80 ml of mobile phase to a quantity of the mixed capsule contents containing the equivalent of 0.1 g of minocycline and mix with the aid of ultrasound. Add sufficient mobile phase to produce 100 ml, filter and dilute 25 ml of the filtrate to 100 ml with the mobile phase.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dissolve 10 mg of *minocycline hydrochloride EPCRS* in *water* and evaporate to dryness on a water bath. Dissolve the residue in 10 ml of mobile phase and add sufficient mobile phase to produce 25 ml.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (20 cm × 4.6 mm) packed with end-capped *octylsilyl silica gel for chromatography* (5 µm) (Nucleosil C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 280 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 25 volumes of a 0.4% w/v solution of *sodium edetate*, 27 volumes of *dimethylformamide* and 50 volumes of a 2.8% w/v solution of *ammonium oxalate*, adjusted to pH 7.0 using a 10.4% w/v solution of *tetrabutylammonium hydroxide*.

For solution (1) allow the chromatography to proceed for 1.5 times the retention time of minocycline.

When the chromatograms are recorded using the prescribed conditions the retention time of minocycline is about 15 minutes. The chromatogram obtained with solution (3) shows a peak with a retention time relative to minocycline of about 0.8 [4-epiminocycline (Ph.Eur. impurity A)].

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to minocycline and 4-epiminocycline is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to 4-epiminocycline is not greater than 2 times the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any other *secondary peak* is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (1.2%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light. Store the solutions at a temperature of 2° to 8° and use within 3 hours of preparation.

(1) Add 80 ml of mobile phase to a quantity of the mixed contents of 20 capsules containing the equivalent of 0.1 g of minocycline and mix with the aid of ultrasound. Add sufficient mobile phase to produce 100 ml, filter and dilute 5 ml of the filtrate to 100 ml with mobile phase.

(2) 0.005% w/v of *minocycline hydrochloride EPCRS* in the mobile phase.

(3) Dissolve 10 mg of *minocycline hydrochloride EPCRS* in *water* and evaporate to dryness on a water bath. Dissolve the residue in 10 ml of mobile phase and add sufficient mobile phase to produce 25 ml.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

When the chromatograms are recorded using the prescribed conditions the retention time of minocycline is about 15 minutes. The chromatogram obtained with solution (3) shows a peak with a retention time relative to minocycline of about 0.8 [4-epiminocycline (Ph.Eur. impurity A)].

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to minocycline and 4-epiminocycline is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{27}N_3O_7$ in the capsules from the chromatograms obtained and using the declared content of $C_{23}H_{27}N_3O_7$,HCl in *minocycline hydrochloride EPCRS*. Each mg of $C_{23}H_{27}N_3O_7$,HCl is equivalent to 0.9261 mg of $C_{23}H_{27}N_3O_7$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of minocycline.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Minocycline Hydrochloride Dihydrate.

Prolonged-release Morphine Tablets

General Notices

Prolonged-release Morphine Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Prolonged-release Morphine Tablets contain Morphine Sulphate. They are formulated so that the medicament is released over a period of several hours. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of morphine sulphate. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of morphine sulphate, $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 20 mg of Morphine Sulphate with 5 ml of *water*, filter and add to the filtrate 0.05 ml of *iron(III) chloride solution R1*. A blue colour is produced.

B. Extract a quantity of the powdered tablets containing 10 mg of Morphine Sulphate with 10 ml of *water*, filter and to 5 ml of the filtrate add 0.15 ml of *dilute potassium hexacyanoferrate (III) solution* and 0.05 ml of *iron(III) chloride solution R1*. A bluish-green colour is produced immediately which changes rapidly to blue.

C. The powdered tablets yield the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Pseudomorphine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of powdered tablets containing 30 mg of Morphine Sulphate with 50 ml of the mobile phase, with the aid of ultrasound if necessary, dilute to 100 ml with the same solvent, mix and filter. Solution (2) contains 0.00033% w/v of *pseudomorphine trihydrate BPCRS* in the mobile phase. Solution (3) contains 0.03% w/v of *morphine sulphate BPCRS* and 0.0003 % w/v of *pseudomorphine BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 0.05 volume of *orthophosphoric acid*, 30 volumes of *acetonitrile* and 70 volumes of 0.01M *sodium octanesulphonate* and (c) a detection wavelength of 281 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to morphine and pseudomorphine is at least 4.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to pseudomorphine is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

Related substances

Comply with the test described under Morphine Suppositories but using 50 µl of each of the following solutions. For solution (1) remove any coating from the tablets and shake a quantity of the powdered tablet cores containing 10 mg of Morphine Sulphate with 10 ml of a mixture of *ethanol (96%)* and *water* for 10 minutes and filter. For solution (2) dissolve 5 mg of *codeine phosphate* in 5 ml of solution (1) and dilute 1 volume of the resulting solution to 200 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with a mixture of equal volumes of *ethanol (96%)* and *water*.

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots. Disregard any spot with an Rf value of less than 0.1.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of powdered tablets containing 30 mg of Morphine Sulphate with 50 ml of the mobile phase, with the aid of ultrasound if necessary, dilute to 100 ml with the same solvent, mix and filter. Solution (2) contains 0.03% w/v of *morphine sulphate BPCRS* and 0.00033% w/v of *pseudomorphine trihydrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture of 0.05 volume of *orthophosphoric acid*, 30 volumes of *acetonitrile* and 70 volumes of 0.01M *sodium octanesulphonate* and (c) a detection wavelength of 281 nm.

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to morphine and pseudomorphine is at least 4.0.

Calculate the content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ using the declared content of $(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O$ in *morphine sulphate BPCRS*.

STORAGE

Prolonged-release Morphine Tablets should be protected from light.

Gastro-resistant Naproxen Tablets

General Notices

Enteric-coated Naproxen Tablets

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Gastro-resistant Naproxen Tablets contain Naproxen. They are made gastro-resistant by enteric-coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of naproxen, $C_{14}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Remove the coating from a number of tablets and powder the uncoated cores. Extract a quantity of the powdered tablets containing 0.2 g of Naproxen with 20 ml of *methanol*, shake for 15 minutes, filter, evaporate the filtrate and dry the residue at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of naproxen *(RS 244)*.

TESTS

Dissolution

Prepare a phosphate buffer pH 7.4 by dissolving 2.62 g of *sodium dihydrogen orthophosphate monohydrate* and 11.5 g of *anhydrous disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml and adjusting the pH to 7.4, if necessary.

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. After 2 hours, withdraw about 10 ml of the medium from the centre of the vessel, filter through a 5-µm filter and measure the *absorbance* of the solution, Appendix II B, at 332 nm using 0.1M *hydrochloric acid* in the reference cell. Measure the *absorbance* of a suitable solution of *naproxen BPCRS* in the phosphate buffer pH 7.4 and calculate the total content of naproxen, $C_{14}H_{14}O_3$, in the medium using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS.* The amount of naproxen released is not more than 5% of the stated amount.

Replace the 0.1M hydrochloric acid in the vessel by 900 ml of the phosphate buffer pH 7.4 previously held at a temperature of 36.5° to 37.5°. After 45 minutes, withdraw a sample of 10 ml of the medium and filter. Immediately measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium, if necessary, at 332 nm using the phosphate buffer in the reference cell. Measure the *absorbance* of a suitable solution of *naproxen BPCRS* in the phosphate buffer and calculate the total content of naproxen, $C_{14}H_{14}O_3$, in the medium using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS*. The amount of naproxen released is not less than 70% of the stated amount.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and a mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.5 g of Naproxen with 10 ml of *methanol* for 15 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Naproxen with 70 ml of *methanol* for 10 minutes with the aid of ultrasound, add sufficient *methanol* to produce 100 ml and centrifuge at 3000 revolutions per minute for 10 minutes. Dilute 1 volume of the supernatant liquid to 10 volumes with a mixture of 32 volumes of *water* and 68 volumes of *methanol*. For solution (2) dilute 1 volume of a 0.1% w/v solution of *naproxen BPCRS* in *methanol* to 10 volumes with a mixture of 32 volumes of *water* and 68 volumes of *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 32 volumes of 0.01M *orthophosphoric acid* and 68 volumes of *methanol* and (c) a detection wavelength of 262 nm.

Calculate the content of $C_{14}H_{14}O_3$ in the tablets from the chromatograms obtained using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS*.

STORAGE

Gastro-resistant Naproxen Tablets should be protected from light.

Nabumetone Oral Suspension

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Nabumetone Oral Suspension contains Nabumetone in a suitable flavoured vehicle.
The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of nabumetone, $C_{15}H_{16}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel GF_{254} precoated plate (Merck 5715 plates are suitable) and *chloroform* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) add a volume of the well-shaken suspension containing 0.1 g of Nabumetone to 10 ml of *chloroform*, shake, allow to separate and use the lower layer. Solution (2) contains 1.0% w/v of *nabumetone BPCRS* in *chloroform*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position to the spot in the chromatogram obtained with solution (2) and the chromatogram obtained with solution (3) shows a single, compact spot at the same Rf value as the spot in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

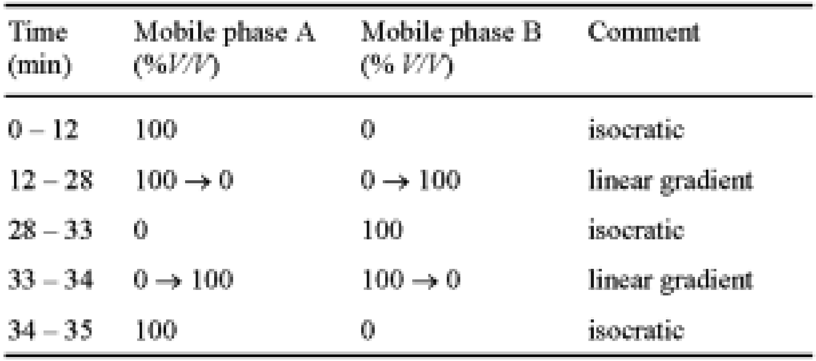
Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a volume of the suspension containing 0.5 g of Nabumetone with 10 ml of *methanol* until completely dispersed, add sufficient *acetonitrile* to produce 100 ml, shake for a further 5 minues and filter (Whatman No. 1 paper is suitable). Solution (2) contains 0.0025% w/v of *nabumetone BPCRS* in *acetonitrile*. Solution (3) contains 0.0015% w/v of *nabumetone impurity F BPCRS* in *acetonitrile*. Solution (4) contains 0.002% w/v of each of *nabumetone BPCRS* and *nabumetone impurity D EPCRS* in *acetonitrile*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (4 µm) (Genesis C18 4µ is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 254 nm. Maintain the temperature of the column at 40°.

Mobile phase A A mixture of 12 volumes of *tetrahydrofuran*, 28 volumes of *acetonitrile for* *chromatography* and 60 volumes of a 0.1% v/v solution of *glacial acetic acid* in *carbon dioxide-free water*.

Mobile phase B A mixture of 24 volumes of *tetrahydrofuran*, 56 volumes of *acetonitrile for chromatography* and 20 volumes of a 0.1% v/v solution of *glacial acetic acid* in *carbon dioxide-free water*.



Time (min)	Mobile phase A (%*V/V*)	Mobile phase B (% *V/V*)	Comment
0 – 12	100	0	isocratic
12 – 28	100 → 0	0 → 100	linear gradient
28 – 33	0	100	isocratic
33 – 34	0 → 100	100 → 0	linear gradient
34 – 35	100	0	isocratic

When the chromatograms are recorded under the prescribed conditions the retention time of nabumetone is about 11 minutes.

The test is not valid unless, in the chromatogram obtained with solution (4) the *resolution factor* between the two principal peaks is at least 1.5.

In the chromatogam obtained with solution (1) the area of any peak corresponding to nabumetone impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%) and the sum of the areas of any other *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add to a weighed quantity of the suspension containing 1 g of Nabumetone 70 ml of *ethanol (96%)*, mix with the aid of ultrasound for 45 minutes, add sufficient *ethanol (96%)* to produce 100 ml and filter (Whatman GF/C paper is suitable). Dilute 5 volumes of the filtrate to 100 volumes with the mobile phase and further dilute 5 volumes of the resulting solution to 50 volumes with the mobile phase. For solution (2) dilute 5 volumes of a 0.1% w/v solution of *nabumetone BPCRS* in *acetonitrile* to 100 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (4 µm) (Genesis C18 4µ is suitable), (b) a mixture of 18 volumes of *tetrahydrofuran*, 40 volumes of a 0.1% v/v solution of *glacial acetic acid* in *carbon dioxide-free water* and 42 volumes of *acetonitrile for chromatography* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm. When the chromatograms are recorded under the prescribed conditions the retention time of nabumetone is about 4 minutes.

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{16}O_2$, weight in volume, from the chromatograms obtained using the declared content of $C_{15}H_{16}O_2$ in *nabumetone BPCRS*.

Nabumetone Tablets

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Nabumetone Tablets contain Nabumetone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nabumetone, $C_{15}H_{16}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum* of the powdered tablets, Appendix II A, is concordant with the *reference spectrum* of nabumetone *(RS 239)*.

Related substances

Comply with the test described under Nabumetone Oral Suspension but using a solution prepared in the following manner as solution (1). Shake a quantity of the powdered tablets containing 0.25 g of Nabumetone with 50 ml of *acetonitrile* for 5 minutes, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) finely powder a quantity of whole tablets containing 5 g of Nabumetone, add 400 ml of *acetonitrile*, mix with the aid of ultrasound for 15 minutes, allow to cool, add sufficient *acetonitrile* to produce 500 ml, mix and filter through a glass-fibre filter (Whatman GF/C is suitable). Dilute 5 volumes of the filtrate to 100 volumes with the mobile phase and further dilute 5 volumes of the resulting solution to 50 volumes with the mobile phase. For solution (2) dilute 5 volumes of a 0.1% w/v solution of *nabumetone BPCRS* in *acetonitrile* to 100 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (4 µm) (Genesis C18 4µ is suitable), (b) a mixture of 18 volumes of *tetrahydrofuran*, 40 volumes of a 0.1% v/v solution of *glacial acetic acid* in *carbon dioxide-free water* and 42 volumes of *acetonitrile for chromatography* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm. When the chromatograms are recorded under the prescribed conditions the retention time of nabumetone is about 4 minutes.

Calculate the content of $C_{15}H_{16}O_2$ in the tablets from the chromatograms obtained using the declared content of $C_{15}H_{16}O_2$ in *nabumetone BPCRS*.

Naftidrofuryl Capsules

General Notices

Action and use

Vasodilator.

DEFINITION

Naftidrofuryl Capsules contain Naftidrofuryl Oxalate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of naftidrofuryl oxalate, $C_{26}H_{35}NO_7$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake, with the aid of ultrasound, a quantity of the powdered contents of the capsules containing 0.1 g of Naftidrofuryl Oxalate with 5 ml of *water* and filter (Whatman GF/C filter paper is suitable). Add 5 ml of 2M *sodium hydroxide* to the filtrate, extract with two 10 ml quantities of *chloroform*, wash the combined chloroform extracts with two 10 ml quantities of *water*, evaporate to dryness using a rotary evaporator and dry the oily residue over *phosphorus pentoxide* at a pressure of 2 kPa for 18 hours. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of naftidrofuryl *(RS 240)*.

B. Mix a quantity of the powdered contents of the capsules containing 0.25 g of Naftidrofuryl Oxalate with 5 ml of *water*, shake for 10 minutes and filter. Add *calcium chloride solution* to the filtrate; a white precipitate is produced. The residue dissolves in mineral acids but is practically insoluble in 2M *acetic acid* and in 6M *ammonia*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of the following solutions. For solution (1) mix with the aid of ultrasound a quantity of the powdered contents of the capsules with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Naftidrofuryl Oxalate and filter (Whatman GF/C filter paper is suitable). Solution (2) contains 0.001% w/v of *3-(1-naphthyl)-2-tetrahydrofurfurylpropionic acid BPCRS* in the mobile phase. Solution (3) contains 0.0002% w/v of *2-diethylaminoethyl-3-(1-naphthyl)-2-(1-naphthylmethyl)propionate oxalate BPCRS* in the mobile phase. Solution (4) contains 0.01% w/v of *naftidrofuryl oxalate BPCRS* and 0.005% w/v of *2-diethylaminoethyl-3-(1-naphthyl)-2-(1-naphthylmethyl)-propionate oxalate BPCRS* in the mobile phase.

The chromatographic conditions described under Assay may be used.

The test is not valid unless in the chromatogram obtained with solution (4) the *resolution factor* between the two principal peaks is at least 4.

Inject solution (1) and record the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 3-(1-naphthyl)-2-tetrahydrofurfurylpropionic acid is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%), the area of any peak corresponding to 2-diethylaminoethyl-3-(1-naphthyl)-2-(1-naphthylmethyl)-propionate oxalate is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.2%), the area of any other *secondary peak* is not greater than half the area of the peak in the chromatogram obtained with solution (3) (0.1%) and the sum of the areas of all the *secondary peaks* other than those corresponding to the named impurities is not greater than 1.5 times the area of the peak in the chromatogram obtained with solution (3) (0.3%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of the following solutions. For solution (1) finely powder the contents of 10 capsules, mix with the aid of a spatula, dissolve with the aid of ultrasound in sufficient of the mobile phase to produce a solution containing 1% w/v of Naftidrofuryl Oxalate, filter (Whatman GF/C filter paper is suitable) and dilute 1 volume of the filtrate to 10 volumes with the mobile phase. Solution (2) contains 0.1% w/v of *naftidrofuryl oxalate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with particles of silica the surface of which has been modified by chemicallybonded phenyl groups (5 µm) (Spherisorb Phenyl is suitable), (b) a mixture of 40 volumes of 0.05M *sodium acetate*, adjusted to pH 4.0 with an 85% v/v solution of *orthophosphoric acid*, and 60 volumes of *acetonitrile* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 283 nm.

Calculate the content of $C_{26}H_{35}NO_7$ in the capsules using the declared content of $C_{26}H_{35}NO_7$ in *naftidrofuryl oxalate BPCRS*.

Nalidixic Acid Oral Suspension

General Notices

Action and use

Quinolone antibacterial.

DEFINITION

Nalidixic Acid Oral Suspension is a suspension of Nalidixic Acid in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of nalidixic acid, $C_{12}H_{12}N_2O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

To 5 ml add 30 ml of *water* and 20 ml of *dilute sodium carbonate solution*, mix and shake with two 30 ml quantities of *chloroform*; discard the chloroform layers. Acidify the aqueous solution with 5M *hydrochloric acid*, shake with 40 ml of *chloroform*, wash the chloroform layer with 10 ml of *water* to which has been added 0.5 ml of 5M *hydrochloric acid*, filter the chloroform layer through absorbent cotton and evaporate the filtrate to dryness. Dissolve the residue in sufficient 0.1M *sodium hydroxide* to produce a solution containing 0.0008% w/v of Nalidixic Acid. The *light absorption* of the solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 258 nm and 334 nm.

ASSAY

Dilute a weighed quantity containing 0.12 g of Nalidixic Acid to 100 ml with 0.01M *sodium hydroxide*, dilute 2 ml to 250 ml with 0.01M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 334 nm, Appendix II B. Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{12}H_{12}N_2O_3$, weight in volume, taking 494 as the value of A(1%, 1 cm) at the maximum at 334 nm.

Nalidixic Acid Tablets

General Notices

Action and use

Quinolone antibacterial.

DEFINITION

Nalidixic Acid Tablets contain Nalidixic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nalidixic acid, $C_{12}H_{12}N_2O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 1 g of Nalidixic Acid add 50 ml of *chloroform*, shake for 15 minutes, filter and evaporate the filtrate to dryness. The residue, after drying at 105°, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of nalidixic acid *(RS 241)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.0008% w/v solution in 0.1M *sodium hydroxide* exhibits maxima at 258 nm and 334 nm.

C. *Melting point*, about 228°, Appendix V A.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Rotate the paddle at 60 revolutions per minute and use as the medium 900 ml of a methanolic phosphate buffer prepared in the following manner: mix 2.3 volumes of 0.2M *sodium hydroxide* with 2.5 volumes of 0.2M *potassium dihydrogen orthophosphate* and 2.0 volumes of *methanol*, dilute to 10 volumes with *water* and, if necessary, adjust the pH to 8.6 using 1M *sodium hydroxide*. Withdraw a sample of 10 ml of the medium, filter and measure the *absorbance* of the solution, suitably diluted if necessary, at the maximum at 334 nm, Appendix II B. Calculate the total content of nalidixic acid, $C_{12}H_{12}N_2O_3$, in the medium taking 494 as the value of A(1%, 1 cm) at the maximum at 334 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of 5M *ammonia*, 20 volumes of *dichloromethane* and 70 volumes of *ethanol (96%)* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.10 g of Nalidixic Acid with 50 ml of *dichloromethane* for 15 minutes, filter, evaporate to dryness and dissolve the residue in 5 ml of *dichloromethane*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *dichloromethane* and further dilute 1 volume of the resulting solution to 2 volumes with *dichloromethane*. For solution (3) dilute 1 volume of solution (2) to 2.5 volumes with *dichloromethane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 0.1 g of Nalidixic Acid add 150 ml of 1M *sodium hydroxide*, shake for 3 minutes, dilute to 200 ml with 1M *sodium hydroxide*, mix and allow to stand for 15 minutes. Dilute 2 ml to 200 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 334 nm, Appendix II B, using 0.01M *sodium hydroxide* in the reference cell. Calculate the content of $C_{12}H_{12}N_2O_3$ taking 494 as the value of A(1%, 1 cm) at the maximum at 334 nm.

STORAGE

Nalidixic Acid Tablets should be protected from light.

Naloxone Injection

General Notices

Action and use

Opioid receptor antagonist.

DEFINITION

Naloxone Injection is a sterile solution of Naloxone Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous naloxone hydrochloride, $C_{19}H_{21}NO_4,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance. Heat the plate at 105° for 15 minutes immediately before use. Use a mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of 2M *ammonia* and 100 ml of *butan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) add 1 ml of *ammonia buffer pH 10.0* to a volume of the injection containing the equivalent of 2 mg of anhydrous naloxone hydrochloride, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol*. Dilute 1 volume of this solution to 20 volumes with *methanol*. Solution (2) contains 0.010% w/v of *naloxone hydrochloride BPCRS* in *methanol*. Protect the plate from light during development. After removal of the plate, dry it in a current of air, spray with a freshly prepared 0.5% w/v solution of *potassium hexacyanoferrate(III)* in *iron(III) chloride solution R1* and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.0 to 4.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance. Heat the plate at 105° for 15 minutes immediately before use. Use a mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of 2M *ammonia* and 100 ml of *butan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) add 1 ml of *ammonia buffer pH 10.0* to a volume of the injection containing the equivalent of 2 mg of anhydrous naloxone hydrochloride, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Protect the plate from light during development. After removal of the plate, dry it in a current of air, spray with a freshly prepared 0.5% w/v solution of *potassium hexacyanoferrate(III)* in *iron(III) chloride solution R1* and examine in daylight. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration of the injection, diluted if necessary with *water BET* to give a solution containing the equivalent of 0.04% w/v of anhydrous naloxone hydrochloride, is 70 IU of endotoxin per ml. Carry out the test using the maximum valid dilution of the above defined solution calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection to contain the equivalent of 0.001% w/v of anhydrous naloxone hydrochloride with a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water*. Solution (2) contains 0.001% w/v of *naloxone hydrochloride BPCRS* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water*. Solution (3) contains 0.001% w/v of *naloxone hydrochloride BPCRS* and 0.0005% w/v of *noroxymorphone* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 to 10 µm) (Zorbax C18 7 to 8 µm is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a solution containing 0.068% w/v of *sodium octanesulphonate* and 0.1% w/v of *sodium chloride* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water* and (c) a detection wavelength of 229 nm.

The test is not valid unless the *resolution factor* between the peaks due to naloxone and noroxymorphone in the chromatogram obtained with solution (3) is at least 1.3.

Calculate the content of $C_{19}H_{21}NO_4$,HCl in the injection using the declared content of $C_{19}H_{21}NO_4$,HCl in *naloxone hydrochloride BPCRS*.

STORAGE

Naloxone Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous naloxone hydrochloride.

When naloxone is prescribed for neonatal use, Neonatal Naloxone Injection (containing the equivalent of 20 micrograms per ml of anhydrous naloxone hydrochloride) shall be dispensed.

Nandrolone Decanoate Injection

General Notices

Action and use

Anabolic steroid; androgen.

DEFINITION

Nandrolone Decanoate Injection is a sterile solution of Nandrolone Decanoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of nandrolone decanoate, $C_{28}H_{44}O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate the surface of which has been modified by chemically-bonded octadecylsilyl groups (Whatman KC 18F plates are suitable) and a mixture of 20 volumes of *water*, 40 volumes of *acetonitrile* and 60 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following three solutions. For solution (1) dilute the injection with *chloroform* to give a solution containing 0.5% w/v of Nandrolone Decanoate. Solution (2) contains 0.5% w/v of *nandrolone decanoate BPCRS* in *chloroform*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air until the solvent has evaporated and heat at 100° for 10 minutes. Allow to cool and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

ASSAY

To a quantity containing 0.1 g of Nandrolone Decanoate add sufficient *chloroform* to produce 100 ml. Dilute 3 ml to 50 ml with *chloroform* and to 5 ml of this solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20 ml. Allow to stand for 45 minutes and measure the *absorbance* of the resulting solution at the maximum at 380 nm, Appendix II B, using in the reference cell 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{28}H_{44}O_3$ from the *absorbance* obtained by repeating the operation using a suitable quantity of *nandrolone BPCRS* and from the declared content of $C_{18}H_{26}O_2$ in *nandrolone BPCRS.* Each mg of $C_{18}H_{26}O_2$ is equivalent to 1.562 mg of $C_{28}H_{44}O_3$.

STORAGE

Nandrolone Decanoate Injection should be protected from light.

LABELLING

The label states that the preparation is for intramuscular injection only.

Nandrolone Phenylpropionate Injection

General Notices

Action and use

Anabolic steroid; androgen.

DEFINITION

Nandrolone Phenylpropionate Injection is a sterile solution of Nandrolone Phenylpropionate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of nandrolone phenylpropionate, $C_{27}H_{34}O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Dissolve a volume containing 50 mg of Nandrolone Phenylpropionate in 8 ml of *petroleum spirit (boiling range, 40° to 60°)* and extract with three 8 ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *petroleum spirit (boiling range, 40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand for 2 hours in ice and filter. The precipitate, after washing with *water* and drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa, complies with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate the surface of which has been modified by chemically-bonded octadecylsilyl groups (Whatman KC 18F plates are suitable) and a mixture of 20 volumes of *water*, 40 volumes of *acetonitrile* and 60 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following three solutions. Solution (1) contains 0.5% w/v of the dried precipitate in *chloroform*. Solution (2) contains 0.5% w/v of *nandrolone phenylpropionate BPCRS* in *chloroform*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air until the solvent has evaporated and heat at 100° for 10 minutes. Allow to cool and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. *Melting point*, about 97°, Appendix V A.

ASSAY

To a quantity containing 0.1 g of Nandrolone Phenylpropionate add sufficient *chloroform* to produce 100 ml. Dilute 3 ml to 50 ml with *chloroform* and to 5 ml of the solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20 ml. Allow to stand for 45 minutes and measure the *absorbance* of the resulting solution at the maximum at 380 nm, Appendix II B, using in the reference cell 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{27}H_{34}O_3$ from the *absorbance* obtained by repeating the operation using a 0.006% w/v solution of *nandrolone phenylpropionate BPCRS* in *chloroform* and beginning at the words 'to 5 ml…' and using the declared content of $C_{27}H_{34}O_3$ in *nandrolone phenylpropionate BPCRS*.

STORAGE

Nandrolone Phenylpropionate Injection should be protected from light.

LABELLING

The label states that the preparation is for intramuscular injection only.

Naproxen Oral Suspension

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Naproxen Oral Suspension is an aqueous suspension of Naproxen in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of naproxen, $C_{14}H_{14}O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Evaporate 50 ml of solution A obtained in the Assay to dryness using a rotary evaporator. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of naproxen *(RS 244)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.004% w/v solution in *methanol* exhibits four maxima, at 262, 271, 316 and 331 nm.

TESTS

Acidity

pH, 2.1 to 4.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) evaporate solution A obtained in the Assay to dryness on a rotary evaporator and dissolve the residue in sufficient *methanol* to produce a solution containing 5.0% w/v of Naproxen. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

To a quantity of the oral suspension containing 0.5 g of Naproxen add 20 ml of 3.5M *hydrochloric acid*, mix, extract with three 50 ml quantities of *chloroform*, filter each extract through *anhydrous sodium sulphate*, combine the filtrates and add sufficient *chloroform* to produce 200 ml (solution A). To 5 ml of solution A add sufficient *methanol* to produce 250 ml and measure the *absorbance* of the resulting solution at the maximum at 331 nm, Appendix II B. Calculate the content of $C_{14}H_{14}O_3$ taking 81.0 as the value of A(1%, 1 cm) at the maximum at 331 nm.

Naproxen Suppositories

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Naproxen Suppositories contain Naproxen in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of naproxen $C_{14}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25 ml quantities of *methanol (80%)*. To the combined extracts add 100 ml of a 2% w/v solution of *sodium chloride*, extract with four 25 ml quantities of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter and add sufficient *chloroform* to produce 200 ml (solution A). Evaporate 100 ml of solution A to dryness using a rotary evaporator. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of naproxen *(RS 244)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.004% w/v solution in *methanol* exhibits four maxima, at 262, 271, 316 and 331 nm.

Related substances

Comply with the test described under Naproxen Oral Suspension using the following solutions. For solution (1) weigh 20 suppositories and cut into small pieces. Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25-ml quantities of *methanol (80%)*. Combine the extracts, add 100 ml of a 2% w/v solution of *sodium chloride*, extract with four 25-ml quantities of *chloroform* filtering each extract through a layer of *anhydrous sodium sulphate* on an absorbent cotton plug moistened with *chloroform*. Evaporate the combined filtrates to dryness using a rotary evaporator with the aid of gentle heat. Shake the residue with 10 ml of *methanol*, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is a 0.01% w/v solution of *naproxen BPCRS* in the mobile phase. For solution (2) disperse ten suppositories in 500 ml of *methanol* on a water bath for 40 minutes with the aid of ultrasound and by swirling the flask. Cool at 5° for 1 hour, centrifuge and use the clear, supernatant liquid; if the solution is still cloudy filter through glass-fibre paper (Whatman GF/C is suitable). To 5 ml of the filtrate add sufficient of the mobile phase to produce a solution containing 0.01% w/v of naproxen. Solution (3) contains 0.01% w/v each of *naproxen BPCRS* and *2-naphthylacetic acid* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 1 volume of a 0.52% w/v solution of *sodium acetate*, adjusted to pH 5.8 using *glacial acetic acid*, and 1 volume of *methanol* and (c) a detection wavelength of 254 nm.

The assay is not valid unless the *resolution factor* between the peaks due to naproxen and 2-naphthylacetic acid in the chromatogram obtained with solution (3) is greater than 3.0.

Calculate the content of $C_{14}H_{14}O_3$ using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS*.

STORAGE

Naproxen Suppositories should be protected from light.

Naproxen Tablets

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Naproxen Tablets contain Naproxen.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of naproxen, $C_{14}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 20 mg of Naproxen with sufficient *methanol* to produce 100 ml and filter. Reserve 10 ml of the filtrate for test B, evaporate the remainder and dry the residue at 105 ^{c}. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of naproxen *(RS 244)*.

B. Dilute the 10 ml portion of the filtrate reserved in test A to 100 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits maxima at 262, 271, 316 and 331 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of a phosphate buffer prepared by dissolving 2.62 g of *sodium dihydrogen orthophospate monohydrate* and 11.50 g of *anhydrous disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml, and adjusting the pH to 7.4 with either 0.1M *sodium hydroxide* or 0.1M *hydrochloric acid* if necessary, and rotating the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Immediately measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium if necessary, at 332 nm using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *naproxen BPCRS* in the dissolution medium and calculate the total content of naproxen, $C_{14}H_{14}O_3$, in the medium using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS*.

Related substances

Comply with the test described under Naproxen Oral Suspension using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.5 g of Naproxen with 10 ml of *methanol* for 15 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 50 mg of Naproxen with 70 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 100 ml and filter. Dilute 10 ml of the filtrate to 50 ml with *methanol* and measure the *absorbance* at the maximum at 331 nm, Appendix II B. Calculate the content of $C_{14}H_{14}O_3$ from the *absorbance* obtained by repeating the operation using a 0.01% w/v solution of *naproxen BPCRS* in *methanol* and using the declared content of $C_{14}H_{14}O_3$ in *naproxen BPCRS*.

STORAGE

Naproxen Tablets should be protected from light.

Neomycin Eye Drops

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Neomycin Eye Drops are a sterile solution of Neomycin Sulphate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 20 volumes of *chloroform*, 40 volumes of 13.5M *ammonia* and 60 volumes of *methanol* as the mobile phase. Apply separately to the plate (1) a volume of the eye drops containing 3.5 IU, (2) 1 µl of a 0.5% w/v solution of *neomycin sulphate EPCRS* in *water* and (3) 1 µl of a mixture of equal volumes of the eye drops and solution (2). After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) and the principal red spot in the chromatogram obtained with solution (3) appears as a single spot.

B. Yield the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Neamine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a freshly prepared 3.85% w/v solution of *ammonium acetate* as the mobile phase. Apply separately to the plate (1) a volume of the eye drops containing 3.5 IU and (2) the same volume of *water* containing 0.1 µg of *neamine EPCRS*. After removal of the plate, dry it in a current of warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution* with *water* to contain 0.5% w/v of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives not more than a very faint blue colour with one drop of a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. Avoid prolonged exposure to the cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. Any spot corresponding to neamine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Neomycin C

Carry out the method for *liquid chromatography*, Appendix III D, injecting 10 µl of each of the following solutions. For solution (1) add 1.5 ml of a freshly prepared 2% w/v solution of *1-*

fluoro-2,4-dinitrobenzene in *methanol* to 0.5 ml of a 0.10% w/v solution of *neomycin sulphate EPCRS* in 0.02M *sodium tetraborate*, heat in a water bath at 60° for 1 hour and cool; dilute the solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer. For solution (2) dilute the eye drops with 0.02M *sodium tetraborate* to contain 700 IU per ml; proceed as for solution (1) but using 0.5 ml of the diluted solution in place of 0.5 ml of the neomycin sulphate solution.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Nucleosil 100-5 is suitable), (b) as the mobile phase with a flow rate of 1.6 ml per minute a solution prepared by mixing 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* with sufficient of a 2.0% v/v solution of *absolute ethanol* in *ethanol-free chloroform* to produce 250 ml and (c) a detection wavelength of 350 nm.

Pass the mobile phase through the column for several hours before injecting the solutions. Record the chromatograms for 1.4 times the retention time of the peak due to neomycin B.

The chromatogram obtained with solution (1) shows a principal peak due to neomycin B and a major *secondary peak* due to neomycin C with a retention time relative to neomycin B of about 0.6.

The *column efficiency*, determined using the peak due to neomycin B in the chromatogram obtained with solution (1), should be not less than 13,000 theoretical plates per metre.

In the chromatogram obtained with solution (2) the area of the peak corresponding to neomycin C is not less than 3% and not more than 15% of the sum of the areas of the peaks corresponding to neomycin B and neomycin C.

ASSAY

Dilute a quantity containing 3500 IU to 50 ml with sterile *phosphate buffer pH 8.0*; dilute 10 ml of the resulting solution to 100 ml with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per ml.

STORAGE

Neomycin Eye Drops should be protected from light.

LABELLING

The strength is stated as the number of IU (Units) per ml.

Neomycin Eye Ointment

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Neomycin Eye Ointment is a sterile preparation containing Neomycin Sulphate in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 20 volumes of *chloroform*, 40 volumes of 13.5M *ammonia* and 60 volumes of *methanol* as the mobile phase. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) disperse a quantity of the eye ointment containing 14,000 IU in 100 ml of *chloroform*, extract with 5 ml of *water* and use the aqueous extract. Solution (2) contains 0.4% w/v of *neomycin sulphate EPCRS* in *water*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) and the principal red spot in the chromatogram obtained with solution (3) appears as a single spot.

TESTS

Neamine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a freshly prepared 3.85% w/v solution of *ammonium acetate* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) disperse a quantity containing 14,000 IU in 20 ml of *chloroform*, shake gently with 8 ml of *water*, allow the layers to separate and use the aqueous layer. Solution (2) contains 0.005% w/v of *neamine EPCRS*. After removal of the plate, dry it in a current of warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution* with *water* to contain 0.5% w/v of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives not more than a very faint blue colour with one drop of a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*. Any spot corresponding to neamine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Neomycin C

Complies with the test described under Neomycin Eye Drops but preparing solution (2) in the following manner. Disperse a quantity of the eye ointment containing 3500 IU in 20 ml of *petroleum spirit (boiling range, 120° to 160°)*, add 5 ml of 0.02M *sodium tetraborate*, shake, separate the aqueous layer and centrifuge; proceed as for solution (1) but using 0.5 ml of the separated aqueous layer in place of 0.5 ml of the neomycin sulphate solution.

ASSAY

Dissolve a quantity containing 3500 IU in 25 ml of *chloroform*, extract with four 20 ml quantities of sterile *phosphate buffer pH 8.0*, combine the extracts and add sufficient of the buffer solution to produce 100 ml. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per g.

LABELLING

The strength is stated as the number of IU (Units) per g.

Neomycin Tablets

General Notices

Action and use

Aminoglycoside antibacterial.

DEFINITION

Neomycin Tablets contain Neomycin Sulphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 20 volumes of *chloroform*, 40 volumes of 13.5M *ammonia* and 60 volumes of *methanol* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 70,000 IU with 25 ml of *water* and filter. Solution (2) contains 0.4% w/v of *neomycin sulphate EPCRS* in *water*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) and the principal red spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. The powdered tablets yield the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Neamine

Comply with the test described under Neomycin Eye Drops but applying separately to the plate 2 µl of each of the following solutions. For solution (1) add 5 ml of *water* to a quantity of the powdered tablets containing 7000 IU, shake for 5 minutes and filter. Solution (2) contains 0.004% w/v of *neamine EPCRS*.

Neomycin C

Comply with the test described under Neomycin Eye Drops but preparing solution (2) in the following manner. Shake a quantity of the powdered tablets containing 17,500 IU with 20 ml of 0.02M *sodium tetraborate*, dilute to 25 ml with the same solvent, mix and centrifuge; proceed as for solution (1) but using 0.5 ml of the separated aqueous layer in place of the 0.5 ml of neomycin sulphate solution.

ASSAY

Weigh and powder 20 tablets. Transfer an accurately weighed quantity of the powder containing 15,000 IU to a flask containing 150 ml of sterile *phosphate buffer pH 8.0* and add sufficient of the buffer solution to produce 250 ml. Allow to stand, dilute 10 ml of the clear supernatant liquid to 100 ml with the buffer solution and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated number of IU.

STORAGE

Neomycin Tablets should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The quantity of active ingredient is stated in terms of the number of IU (Units).

Neonatal Naloxone Injection

General Notices

Action and use

Opioid receptor antagonist.

DEFINITION

Neonatal Naloxone Injection is a sterile solution containing the equivalent of 20 micrograms per ml of anhydrous naloxone hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous naloxone hydrochloride, $C_{19}H_{21}NO_4,HCl$

0.0185 to 0.0215% w/v.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance. Heat the plate at 105° for 15 minutes immediately before use. Use a mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of 2M *ammonia* and 100 ml of *butan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) add 1 ml of *ammonia buffer pH 10.0* to a volume of the injection containing the equivalent of 0.1 mg of anhydrous naloxone hydrochloride, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol*. Solution (2) contains 0.010% w/v of *naloxone hydrochloride BPCRS* in *methanol*. Protect the plate from light during development. After removal of the plate, dry it in a current of air, spray with a freshly prepared 0.5% w/v solution of *potassium hexacyanoferrate(III)* in *iron(III) chloride solution R1* and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.0 to 4.5, Appendix V L.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is 3.5 IU per ml. Carry out the test using the maximum valid dilution of the injection calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection with a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water* to contain the equivalent of 0.001% w/v of anhydrous naloxone hydrochloride. Solution (2) contains 0.001% w/v of *naloxone hydrochloride BPCRS* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water*. Solution (3) contains 0.001% w/v of *naloxone hydrochloride BPCRS* and 0.0005% w/v of *noroxymorphone* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 to 10 µm) (Zorbax C18 7 to 8 µm is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a solution containing 0.068% w/v of *sodium octanesulphonate* and 0.1% w/v of *sodium chloride* in a mixture of 1 volume of *orthophosphoric acid*, 450 volumes of *methanol* and 550 volumes of *water* and (c) a detection wavelength of 229 nm.

The test is not valid unless the *resolution factor* between the peaks due to naloxone and noroxymorphone in the chromatogram obtained with solution (3) is at least 1.3.

Calculate the content of $C_{19}H_{21}NO_4$,HCl in the injection using the declared content of $C_{19}H_{21}NO_4$,HCl in *naloxone hydrochloride BPCRS*.

STORAGE

Neonatal Naloxone Injection should be protected from light.

LABELLING

The label states (1) the quantity of active ingredient in terms of the equivalent amount of anhydrous naloxone hydrochloride; (2) that the injection is for neonatal use.

Neostigmine Injection

General Notices

Action and use

Cholinesterase inhibitor.

DEFINITION

Neostigmine Injection is a sterile solution of Neostigmine Metilsulfate in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of neostigmine metilsulfate, $C_{13}H_{22}N_2O_6S$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dilute, if necessary, a volume of the injection containing 2.5 mg of Neostigmine Metilsulfate to 5 ml with *water*, shake with three 10 ml quantities of *ether* and discard the ether extracts. The *light absorption* of the aqueous solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 260 nm and 266 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 5 volumes of *water*, 10 volumes of *formic acid*, 35 volumes of *methanol* and 50 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) use the injection diluted, if necessary, with *water* to produce a solution containing 0.05% w/v of Neostigmine Metilsulfate. Solution (2) contains 0.05% w/v of *neostigmine metilsulfate EPCRS*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

C. To 1 ml add 0.5 ml of 5M *sodium hydroxide* and evaporate to dryness on a water bath. Heat rapidly on an oil bath to about 250° and maintain at this temperature for about 30 seconds. Cool, dissolve the residue in 1 ml of *water*, cool in ice and add 1 ml of *diazobenzenesulphonic acid solution*. An orange-red colour is produced.

TESTS

Acidity

pH, 4.5 to 6.5, Appendix V L.

(3-Hydroxy)trimethylanilinium methyl sulphate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is the injection diluted, if necessary, with *water* to contain 0.05% w/v of

Neostigmine Metilsulfate. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *water*. For solution (3) add 0.05 ml of 5M *sodium hydroxide* to 1 ml of solution (1) and allow to stand for 5 minutes. Add 0.1 ml of 5M *hydrochloric acid* and use immediately.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 60 RP-select B is suitable), (b) as the mobile phase at a flow rate of 1.1 ml per minute a 0.0015M solution of *sodium heptanesulphonate* in a mixture of 15 volumes of *acetonitrile* and 85 volumes of 0.05M *potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *orthophosphoric acid* and (c) a detection wavelength of 215 nm.

In the chromatogram obtained with solution (3) the principal peak has a retention time of about 6.8 minutes (neostigmine metilsulfate) and there is a peak with a relative retention time of about 0.5 ((3-hydroxy)trimethylanilinium methylsulphate). In the chromatogram obtained with solution (1), the area of any *secondary peak* with a retention time corresponding to that of the peak due to (3-hydroxy)trimethylanilinium methylsulphate in the chromatogram obtained with solution (3) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Dilute a quantity containing 25 mg of Neostigmine Metilsulfate to 50 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 260 nm, Appendix II B. Calculate the content of $C_{13}H_{22}N_2O_6S$ taking 14.35 as the value of A(1%, 1 cm) at the maximum at 260 nm.

STORAGE

Neostigmine Injection should be protected from light.

Neostigmine Tablets

General Notices

Action and use

Cholinesterase inhibitor.

DEFINITION

Neostigmine Tablets contain Neostigmine Bromide.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of neostigmine bromide, $C_{12}H_{19}BrN_2O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Triturate a quantity of the powdered tablets containing 60 mg of Neostigmine Bromide with two 5 ml quantities of hot *chloroform* and filter. Evaporate the filtrate to dryness on a water bath, extract the residue with 5 ml of hot *water*, cool and filter. To 0.1 ml of the filtrate add 0.5 ml of 5M *sodium hydroxide* and evaporate to dryness on a water bath. Heat quickly in an oil bath to about 250^{c} and maintain at this temperature for about 30 seconds. Cool, dissolve the residue in 1 ml of *water*, cool in ice and add 1 ml of *diazobenzenesulphonic acid solution*. A cherry-red colour is produced.

B. The aqueous filtrate obtained in text A yields the reactions characteristic *of bromides*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. Transfer a quantity of the powder containing 0.15 g of Neostigmine Bromide to a semi-micro ammonia-distillation apparatus, add 20 ml of a 50% w/v solution of *sodium hydroxide* and 0.5 ml of a 2% solution of *octan-2-ol* in *liquid paraffin*. Pass a current of steam through the mixture, collect the distillate in 50 ml of 0.01M *sulphuric acid VS* until the total volume is about 200 ml and titrate the excess of acid with 0.02M *sodium hydroxide VS* using *methyl red solution* as indicator. Repeat the operation without the powdered tablets. The difference between the titrations represents the amount of acid required to neutralise the dimethylamine produced. Each ml of 0.01M *sulphuric acid VS* is equivalent to 6.064 mg of $C_{12}H_{19}BrN_2O_2$.

STORAGE

Neostigmine Tablets should be protected from light.

Niclosamide Tablets

General Notices

Action and use

Antihelminthic.

DEFINITION

Niclosamide Tablets contain Anhydrous Niclosamide or Niclosamide Monohydrate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous niclosamide, $C_{13}H_8Cl_2N_2O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Heat a quantity of the powdered tablets containing 0.5 g of anhydrous niclosamide with 25 ml of hot *ethanol (96%)*, filter while hot and evaporate the filtrate to dryness on a water bath. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of niclosamide *(RS 245)*. If the spectra are not concordant heat a suitable quantity of the residue at 120° for 1 hour and prepare a new spectrum.

B. Burn 20 mg by the method for *oxygen-flask combustion*, Appendix VIII C, using 5 ml of 2M *sodium hydroxide* as the absorbing liquid. The resulting solution yields a white precipitate with *silver nitrate solution* which is insoluble in 2M *nitric acid* but soluble in 5M *ammonia*.

C. Heat 50 mg with 5 ml of 1M *hydrochloric acid* and 0.1 g of *zinc powder* in a water bath for 10 minutes, cool and filter. To the filtrate add 0.5 ml of a 1% w/v solution of *sodium nitrite* and allow to stand for 10 minutes. Add 2 ml of a 2% w/v solution of *ammonium sulphamate*, shake, allow to stand for 10 minutes and add 2 ml of a 0.5% w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride*. A deep red colour is produced.

TESTS

Disintegration

The requirement for Disintegration does not apply to Niclosamide Tablets.

2-Chloro-4-nitroaniline

Boil a quantity of the powdered tablets containing 0.10 g of anhydrous niclosamide with 20 ml of *methanol* for 2 minutes, cool, add sufficient 1M *hydrochloric acid* to produce 50 ml and filter. To 10 ml of the filtrate add 0.5 ml of a 0.5% w/v solution of *sodium nitrite* and allow to stand for 10 minutes. Add 1 ml of a 2% w/v solution of *ammonium sulphamate*, shake, allow to stand for 10 minutes and add 1 ml of a 0.5% w/v solution of N-*(1-naphthyl)ethylenediamine* *dihydrochloride*. Any colour produced is not more intense than that obtained by treating 20 ml of a solution in *methanol* containing 10 µg of *2-chloro-4-nitroaniline* in the same manner and at the same time, beginning at the words 'add sufficient 1M *hydrochloric acid* …'.

5-Chlorosalicylic acid

Boil a quantity of the powdered tablets containing 0.50 g of anhydrous niclosamide with 10 ml of *water* for 2 minutes, cool, filter and to the filtrate add 0.2 ml of *iron(III) chloride solution R1*. No red or violet colour is produced.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 1 volume of solution (2) to 100 volumes with *acetonitrile* and further dilute 1 volume of this solution to 20 volumes with *acetonitrile*. For solution (2) shake a quantity of the powdered tablets containing 0.1 g of anhydrous niclosamide with 80 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 ml and filter.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) a mixture of 50 volumes of *acetonitrile* and 50 volumes of a solution containing 0.2% w/v of *potassium dihydrogen orthophosphate*, 0.2% w/v of *tetrabutylammonium hydrogen sulphate* and 0.1% w/v of *disodium hydrogen orthophosphate* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 230 nm. Adjust the sensitivity so that the height of the peak corresponding to niclosamide in the chromatogram obtained with solution (1) is not less than 20% of full-scale deflection. Record the chromatogram for twice the retention time of niclosamide.

The sum of the areas of any *secondary peaks* in the chromatogram obtained with solution (2) is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (1). Disregard any peak with an area less than 10% of the area of the area of the principal peak in the chromatogram obtained with solution (1).

ASSAY

Weigh and powder 20 tablets. Carry out Method II for *non-aqueous titration*, Appendix VIII A, using a quantity of the powdered tablets containing 0.3 g of anhydrous niclosamide dissolved in 60 ml of *dimethylformamide*, 0.1M *tetrabutylammonium hydroxide VS* as titrant and determining the end point potentiometrically. Each ml of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 32.71 mg of $C_{13}H_8Cl_2N_2O_4$.

STORAGE

Niclosamide Tablets should be protected from light.

LABELLING

The label states that the tablets should be chewed before swallowing.

When the active ingredient is Niclosamide Monohydrate the quantity is stated in terms of the equivalent amount of anhydrous niclosamide.

Nicotinamide Tablets

General Notices

DEFINITION

Nicotinamide Tablets contain Nicotinamide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nicotinamide, $C_6H_6N_2O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Nicotinamide with 25 ml of *absolute ethanol* for 15 minutes, filter and evaporate the filtrate to dryness on a water bath. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of nicotinamide *(RS 246)*.

B. The *light absorption* of the solution obtained in the Assay, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 262 nm and two shoulders, at 258 nm and 269 nm.

C. Shake a quantity of the powdered tablets containing 50 mg of Nicotinamide with 50 ml of *water* and filter. To 2 ml of the filtrate add 2 ml of *cyanogen bromide solution* and 3 ml of a 2.5% v/v solution of *aniline* and shake. A yellow colour is produced.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 10 volumes of *water*, 45 volumes of *ethanol (96%)* and 48 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Nicotinamide with 15 ml of *absolute ethanol* for 15 minutes, filter, evaporate to dryness on a water bath and dissolve the residue as completely as possible in 1 ml of *absolute ethanol*. For solution (2) dilute 1 volume of solution (1) to 400 volumes with *absolute ethanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 50 mg of Nicotinamide with 50 ml of *ethanol (96%)* for 15 minutes and dilute to 100 ml with *ethanol (96%)*. Mix, filter, dilute 5 ml of the filtrate to 100 ml with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at 262 nm, Appendix II B. Calculate the content of $C_6H_6N_2O$ taking 241 as the value of A(1%, 1 cm) at the maximum at 262 nm.

STORAGE

Nicotinamide Tablets should be protected from light.

Nicotinic Acid Tablets

General Notices

DEFINITION

Nicotinic Acid Tablets contain Nicotinic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nicotinic acid, $C_6H_5NO_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 8 volumes of *water*, 45 volumes of *ethanol (96%)* and 48 volumes of *chloroform* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Nicotinic Acid with 50 ml of hot *ethanol (96%)*, filter and allow the filtrate to cool. Solution (2) contains 0.1% w/v of *nicotinic acid* in *ethanol (96%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 0.1 g of Nicotinic Acid with *ethanol (96%)*, filter and evaporate the filtrate to dryness. To the residue add 10 mg of *citric acid* and 0.15 ml of *acetic anhydride* and heat on a water bath. A reddish-violet colour is produced.

C. Triturate a quantity of the powdered tablets containing 50 mg of Nicotinic Acid with 10 ml of *water* and filter. To 2 ml of the filtrate add 6 ml of *cyanogen bromide solution* and 1 ml of a 2.5% v/v solution of *aniline*. A golden yellow colour is produced.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.3 g of Nicotinic Acid add 40 ml of hot *ethanol (96%)*, previously neutralised to *phenolphthalein solution R1*, and shake. Allow to stand for 15 minutes, swirling occasionally, and then shake for 10 minutes. Filter through absorbent cotton and wash the filter with *ethanol (96%)*. Add 50 ml of *carbon dioxide-free water* and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 12.31 mg of $C_6H_5NO_2$.

Nicotinyl Alcohol Tablets

General Notices

Action and use

Vasodilator.

DEFINITION

Nicotinyl Alcohol Tablets contain Nicotinyl Alcohol Tartrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nicotinyl alcohol tartrate, $C_6H_7NO,C_4H_6O_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of 4 volumes of 13.5M *ammonia*, 16 volumes of *methanol*, 30 volumes of *1,4-dioxan* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Nicotinyl Alcohol Tartrate with 50 ml of *methanol*, filter and evaporate the filtrate to dryness at about 30° at a pressure of 2 kPa. Add 2 ml of *water* to the residue, shake, filter and add 0.1 ml of 13.5M *ammonia* to the filtrate. For solution (2) dilute 1 volume of solution (1) to 500 volumes with 0.1M *ammonia*. Solution (3) contains 0.025% w/v of *3-(aminomethyl)pyridine* in 0.1M *ammonia*. Solution (4) contains 0.025% w/v of *nicotinyl alcohol tartrate BPCRS* in 0.1M *ammonia*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray with a 2% w/v solution of *chloro-2,4,6-trinitrobenzene* in *absolute ethanol*, dry in a current of air and spray with a 5% w/v solution of *sodium carbonate*. In the chromatogram obtained with solution (1), any spot corresponding to 3-(aminomethyl)pyridine is not more intense than the spot in the chromatogram obtained with solution (3) (0.2%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%). Disregard any spot due to tartaric acid remaining on the line of application.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 50 mg of Nicotinyl Alcohol Tartrate with 150 ml of 0.1M *hydrochloric acid* for 10 minutes, dilute to 250 ml with the same solvent, mix and filter. Dilute 10 ml of the filtrate to 100 ml with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 261 nm, Appendix II B. Calculate the content of $C_6H_7NO,C_4H_6O_6$ taking 210 as the value of A(1%, 1 cm) at the maximum at 261 nm.

Nifedipine Capsules

General Notices

Action and use

Calcium channel blocker.

DEFINITION

Nifedipine Capsules contain Nifedipine.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of nifedipine, $C_{17}H_{18}N_2O_6$

95.0 to 105.0% of the stated amount.

Carry out all the following procedures in the dark or under long-wavelength light (greater than 420 nm). Prepare solutions immediately before use and protect them from light.

IDENTIFICATION

A. Add a quantity of the contents of the capsules containing 50 mg of Nifedipine to 10 ml of *water* and mix with the aid of ultrasound for 5 minutes, filter (Whatman GF/C paper is suitable), wash the residue with *water* and dry at 110°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of nifedipine *(RS 248)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane* as the mobile phase in an unsaturated tank. Apply separately to the plate 5 µl of each of the following solutions in a mixture of equal volumes of *dichloromethane* and *methanol*. For solution (1) shake a quantity of the contents of the capsules containing 20 mg of Nifedipine with 10 ml of the solvent mixture and filter. Solution (2) contains 0.2% w/v of *nifedipine BPCRS* in the solvent mixture. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, appearance under ultraviolet light and size to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium and measure the *absorbance* of a 2-cm layer of the solution, suitably diluted if necessary, at the maximum at 340 nm, Appendix II B. Measure the *absorbance* of a 2-cm layer of a solution prepared by diluting a 0.025% w/v solution of *nifedipine BPCRS* in *methanol* to a suitable volume with the dissolution medium and using the dissolution medium in the reference cell. Calculate the total content of nifedipine, $C_{17}H_{18}N_2O_6$, in the medium from the absorbances obtained and from the declared content of $C_{17}H_{18}N_2O_6$ in *nifedipine BPCRS*.

Nitro- and nitroso-phenylpyridine analogues

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the contents of the capsules containing 20 mg of Nifedipine in 8 ml of *methanol* and dilute to 20 ml with a mixture of 9 volumes of *acetonitrile,* 36 volumes of *methanol* and 55 volumes of *water*. Solution (2) contains 0.0010% w/v of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate EPCRS* (nitrophenylpyridine analogue) in a mixture of 5 volumes of *acetonitrile,* 33 volumes of *water* and 62 volumes of *methanol*. Solution (3) contains 0.00050% w/v of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5-dicarboxylate EPCRS* (nitrosophenylpyridine analogue) in a mixture of 5 volumes of *acetonitrile,* 33 volumes of *water* and 62 volumes of *methanol.* For solution (4) dilute 2 volumes of a solution in *methanol* containing 0.25% w/v of *nifedipine BPCRS*, 0.0025% w/v each of the nitrophenylpyridine analogue and nitrosophenylpyridine analogue and 0.0050% w/v of *propyl hydroxybenzoate* to 5 volumes with a mixture of 9 volumes of *acetonitrile*, 36 volumes of *methanol* and 55 volumes of *water.*

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable), (b) a mixture of 9 volumes of *acetonitrile*, 36 volumes of *methanol* and 55 volumes of *borate buffer pH 8.0* as the mobile phase with a flow rate of 2.0 ml per minute and (c) a detection wavelength of 220 nm.

The test is not valid unless the chromatogram obtained with solution (4) closely resembles the reference chromatogram supplied with *nifedipine BPCRS*.

In the chromatogram obtained with solution (1) the areas of any peaks corresponding to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue are not greater than the areas of the corresponding peaks in the chromatograms obtained with solution (2) (1%) and solution (3) (0.5%), respectively.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. For solution (1) take ten capsules and break them beneath the surface of 30 ml of *acetonitrile*. Stir to dissolve the capsule contents. Transfer the resulting solution to a 250 ml graduated flask. Wash the capsule shells with several portions of the mobile phase, transferring the washings to the flask, add sufficient of the mobile phase to produce 250 ml and mix. If necessary, further dilute a portion of the solution with the mobile phase to give a solution containing 0.02% w/v of nifedipine. For solution (2) dissolve 50 mg of *nifedipine BPCRS* in 30 ml of *acetonitrile* and dilute to 250 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil C18 is suitable), (b) a mixture of 40 volumes of *acetonitrile* and 60 volumes of a 0.03% v/v solution of *orthophosphoric acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 235 nm.

Calculate the content of $C_{17}H_{18}N_2O_6$ in the capsules using the declared content of $C_{17}H_{18}N_2O_6$ in *nifedipine BPCRS*.

Nikethamide Injection

General Notices

Action and use

Central nervous system stimulant.

DEFINITION

Nikethamide Injection is a sterile solution containing 25% w/v of Nikethamide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of nikethamide, $C_{10}H_{14}N_2O$

24.0 to 26.0% w/v.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

Make 1 ml alkaline with 5M *sodium hydroxide*, extract with 5 ml of *dichloromethane* and evaporate the solvent. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of nikethamide *(RS 249)*.

TESTS

Acidity or alkalinity

pH, 6.0 to 8.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 25 volumes of *propan-1-ol* and 75 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute 1 ml of the injection to 5 ml with *methanol*. Solutions (2) and (3) contain 0.05% w/v and 0.005% w/v respectively of *ethylnicotinamide EPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to ethylnicotinamide in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Dilute 5 ml to 500 ml with *water*. To 5 ml of the solution add 5 ml of 1M *hydrochloric acid* and dilute to 500 ml with *water*. Measure the *absorbance* of the resulting solution at the maximum at 263 nm, Appendix II B. Calculate the content of $C_{10}H_{14}N_2O$ taking 282 as the value of *A* (1%, 1 cm) at the maximum at 263 nm.

Nimodipine Intravenous Infusion

General Notices

Action and use

Calcium channel blocker.

DEFINITION

Nimodipine Intravenous Infusion is a sterile solution of Nimodipine in a suitable aqueous alcoholic solvent.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of nimodipine, $C_{21}H_{26}N_2O_7$

95.0 to 105.0% of the stated amount.

Carry out the following procedures protected from light or under long-wavelength light (greater than 420 nm). Prepare the solutions immediately before use and protect them from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions as bands. For solution (1) extract a volume of the intravenous infusion containing 4 mg of Nimodipine with 4 ml of *dichloromethane* and use the dichloromethane layer. Solution (2) is a 0.1% w/v solution of *nimodipine BPCRS* in *dichloromethane*. Solution (3) is a mixture of equal volumes of solution (1) and solution (2). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray the plate with a freshly prepared 0.1% w/v solution of *2,6-dichloroquinonechlorimide* in *ethanol* and heat at 110^{c} for about 3 minutes. The bands due to nimodipine are brownish-green to bluish-green. The principal band in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal band in the chromatogram obtained with solution (3) appears as a single compact band.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.5, Appendix V L.

Bacterial endotoxins

The endotoxin limit concentration is 5.0 IU per ml, Appendix XIV C.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the intravenous infusion, if necessary, with *absolute ethanol*, to contain 0.02% w/v of Nimodipine. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and dilute 2 volumes of this solution to 10 volumes with the mobile phase. Solution (3) contains 0.0001% w/v of *nimodipine impurity A EPCRS* in *absolute ethanol*. Solution (4) contains 0.0001% w/v each of *nimodipine BPCRS* and *nimodipine impurity A EPCRS* in *absolute ethanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher RP-18 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 12 volumes of *acetonitrile,* 24 volumes of *tetrahydrofuran* and 64 volumes of *water* and (c) a detection wavelength of 235 nm. Maintain the column temperature at 30°.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to nimodipine and nimodipine impurity A is at least 1.5 and the *symmetry factor* of the peak due to nimodipine is not more than 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to nimodipine impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%). The sum of the areas of any *secondary peaks* other than any peak corresponding to impurity A is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the intravenous infusion, if necessary, with *absolute ethanol*, to produce a solution containing 0.02% w/v of Nimodipine. Solution (2) contains 0.02% w/v of *nimodipine BPCRS* in *absolute ethanol*. Solution (3) contains 0.002% w/v each of *nimodipine BPCRS* and *nimodipine impurity A EPCRS* in *absolute ethanol*.

The chromatographic conditions described under Related substances may be used.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.3 and the *symmetry factor* of the peak due to nimodipine is not more than 2.0.

Calculate the content of $C_{21}H_{26}N_2O_7$ in the intravenous infusion using the declared content of $C_{21}H_{26}N_2O_7$ in *nimodipine BPCRS*.

STORAGE

Nimodipine Intravenous Infusion should be protected from light. It should not be allowed to come into contact with polyvinyl chloride (PVC).

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Nimodipine.

Nimodipine Tablets

General Notices

Action and use

Calcium channel blocker.

DEFINITION

Nimodipine Tablets contain Nimodipine. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nimodipine,$C_{21}H_{26}N_2O_7$

95.0 to 105.0% of the stated amount.

Carry out the following procedures protected from light or under long-wavelength light (greater than 420 nm). Prepare solutions immediately before use and protect them from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck HPTLC silica gel 60 F_{254} plates are suitable) and a mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 60 mg of Nimodipine with 10 ml of *ethyl acetate* for 15 minutes, centrifuge and use the supernatant liquid. Solution (2) is a 0.6% w/v solution of *nimodipine BPCRS* in *ethyl acetate*. Solution (3) is a mixture of equal volumes of solution (1) and solution (2). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray the plate with a freshly prepared 0.1% w/v solution of *2, 6-dichloroquinonechlorimide* in *ethanol* and heat at 110° for about 3 minutes. The spot due to nimodipine is greyish-violet. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of acetate buffer pH 4.5 prepared as described below containing 0.3% w/v of *sodium dodecyl sulphate* and rotate the paddle at 75 revolutions per minute. Prepare the buffer solution by dissolving 0.299 g of *sodium acetate* in 50 ml of *water*, add 0.174 g of *glacial acetic acid* and dilute to 100 ml with *water*. After 30 minutes withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium if necessary, at the maximum at 340 nm using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *nimodipine BPCRS* in the dissolution medium and calculate the total content of nimodipine, $C_{21}H_{26}N_2O_7$, in the medium using the declared content of $C_{21}H_{26}N_2O_7$ in *nimodipine BPCRS*. The amount of nimodipine released is not less than 85% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol* to a quantity of the powdered tablets containing 60 mg of Nimodipine, mix with the aid of ultrasound for 5 minutes, add sufficient *methanol* to produce 100 ml, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and dilute 2 volumes of this solution to 10 volumes with the mobile phase. Solution (3) contains 0.0003% w/v of *nimodipine impurity A EPCRS* in the mobile phase. Solution (4) contains 0.0002% w/v each of *nimodipine BPCRS* and *nimodipine impurity A EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (7 µm) (Lichrosorb RP-18 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 13 volumes of *acetonitrile*, 26 volumes of *tetrahydrofuran* and 60 volumes of *water* and (c) a detection wavelength of 235 nm. Maintain the column temperature at 40°.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to nimodipine and nimodipine impurity A is at least 1.5 and the *symmetry factor* of the peak due to nimodipine is not more than 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to nimodipine impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%). The sum of the areas of any *secondary peaks* other than any peak corresponding to impurity A is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol* to a quantity of the powdered tablets containing 60 mg of Nimodipine, mix with the aid of ultrasound for 5 minutes, add sufficient *methanol* to produce 100 ml, centrifuge and use the supernatant liquid. Solution (2) contains 0.06% w/v of *nimodipine BPCRS* in *methanol*. Solution (3) contains 0.002% w/v of *nimodipine BPCRS* and 0.002% w/v of *nimodipine impurity A EPCRS* in *methanol*.

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to nimodipine and nimodipine impurity A is at least 1.5, and the *symmetry factor* of the peak due to nimodipine is not more than 2.

Calculate the content of $C_{21}H_{26}N_2O_7$ in the tablets using the declared content of $C_{21}H_{26}N_2O_7$ in *nimodipine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Nimodipine.

Nitrazepam Oral Suspension

General Notices

Action and use

Benzodiazepine.

DEFINITION

Nitrazepam Oral Suspension is a suspension of Nitrazepam in a suitable flavoured vehicle, which may be coloured.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of nitrazepam, $C_{15}H_{11}N_3O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 15 volumes of *ethyl acetate* and 85 volumes of *nitromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add a quantity of the oral suspension containing 20 mg of Nitrazepam to 40 ml of *water*, extract with successive quantities of 50, 20 and 20 ml of *chloroform*, filtering each extract through phase-separating paper, and add sufficient *chloroform* to the combined extracts to produce 100 ml. Solution (2) contains 0.02% w/v of *nitrazepam BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and visualise the spots by *Method I*. A spot in the chromatogram obtained with solution (1) corresponds to the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has a similar retention time to the peak due to nitrazepam in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.00625% w/v of *nitrazepam BPCRS* in *chloroform*. For solution (2) add a quantity of the oral suspension containing 12.5 mg of Nitrazepam to 25 ml of *water*, extract with three 50 ml quantities of *chloroform*, filtering each extract through phase-separating paper, and add sufficient *chloroform* to produce 200 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb or Partisil is suitable), (b) a mixture of 10 volumes of *absolute ethanol* and 90 volumes of n-*hexane* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 254 nm.

Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{11}N_3O_3$, weight in volume, using the declared content of $C_{15}H_{11}N_3O_3$ in *nitrazepam BPCRS*.

STORAGE

Nitrazepam Oral Suspension should be protected from light.

Nitrazepam Tablets

General Notices

Action and use

Benzodiazepine.

DEFINITION

Nitrazepam Tablets contain Nitrazepam.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of Nitrazepam, $C_{15}H_{11}N_3O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 280 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *methanol* and 100 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 0.1% w/v of Nitrazepam, allow to settle and decant the supernatant liquid. Solution (2) contains 0.1% w/v of *nitrazepam BPCRS* in *methanol*. After removal of the plate, spray it with a 10% v/v solution of *sulphuric acid* in *absolute ethanol*, heat at 105° for 10 minutes and examine under *ultraviolet light* (*365 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To a quantity of the powdered tablets containing 5 mg of Nitrazepam add 5 ml of *hydrochloric acid* and 10 ml of *water*, heat on a water bath for 15 minutes and filter. To the clear filtrate add 1 ml of a 0.1% w/v solution of *sodium nitrite*, allow to stand for 3 minutes and add 1 ml of a 0.5% w/v solution of *sulphamic acid*. Allow to stand for a further 3 minutes and add 1 ml of a 0.1% w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*. A red colour is produced.

TESTS

Carry out the following tests protected from light.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Measure the *absorbance,* Appendix II B, of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 280 nm, Appendix II B, using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *nitrazepam BPCRS* in dissolution medium at the maximum at 280 nm, Appendix II B, using dissolution medium in the reference cell. Calculate the total content of nitrazepam, $C_{15}H_{11}N_3O_3$, in the medium using the declared content of $C_{15}H_{11}N_3O_3$ in *nitrazepam BPCRS.*

Decomposition products

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 15 volumes of *ethyl acetate* and 85 volumes of *nitromethane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µl of each of the following freshly prepared solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Nitrazepam with 4 ml of a mixture of equal volumes of *dichloromethane* and *methanol* for 5 minutes, centrifuge and use the clear supernatant liquid. For solution (2) dissolve 10 mg of *aminonitrobenzophenone* in *acetone* and dilute to 100 ml with the same solvent; dilute 25 ml of the solution to 50 ml with *acetone*. For solution (3) dissolve 10 mg of *nitrazepam impurity A EPCRS* (3-amino-6-nitro-4-phenylquinol-2(1*H*)-one) in *acetone* and dilute to 100 ml with the same solvent; dilute 25 ml to 50 ml with *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). In the chromatogram obtained with solution (1) any spot corresponding to aminonitrobenzophenone is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and any spot corresponding to 3-amino-6-nitro-4-phenylquinol-2(1*H*)-one is not more intense than the spot in the chromatogram obtained with solution (3) (1%).

Uniformity of content

Tablets containing less than 2 mg or less than 2% w/w of Nitrazepam comply with the requirements stated under Tablets using the following method of analysis.

To a powdered tablet add 5 ml of *water*, mix and allow to stand for 15 minutes. Add 70 ml of a 0.5% v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes, add sufficient of the 0.5% v/v solution of *hydrochloric acid* in *methanol* to produce 100 ml and filter. Dilute, if necessary, with sufficient of a 0.5% v/v solution of *hydrochloric acid* in *methanol* to produce a solution containing 0.001% w/v of nitrazepam. Measure the *absorbance* of the resulting solution immediately at the maximum at 280 nm, Appendix II B, using a 0.5% v/v solution of *hydrochloric acid* in *methanol* in the reference cell. Calculate the content of $C_{15}H_{11}N_3O_3$ in the solution from the absorbance obtained from a solution containing 0.001% w/v *nitrazepam BPCRS* in a 0.5% v/v solution of *hydrochloric acid* in *methanol* and from the declared content of $C_{15}H_{11}N_3O_3$ in *nitrazepam BPCRS.*

ASSAY

For tablets containing 2 mg or more or 2% w/w or more of Nitrazepam

Weigh and powder 20 tablets. To a quantity of the powder containing 5 mg of Nitrazepam add 5 ml of *water*, mix and allow to stand for 15 minutes. Add 70 ml of a 0.5% v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes, add sufficient of the 0.5% v/v solution of *hydrochloric acid* in *methanol* to produce 100 ml and filter. Dilute 10 ml of the filtrate to 50 ml with the 0.5% v/v solution of *hydrochloric acid* in *methanol*. Measure the *absorbance* of the resulting solution immediately at the maximum at 280 nm using a 0.5% v/v solution of *hydrochloric acid* in *methanol* in the reference cell, Appendix II B. Calculate the content of $C_{15}H_{11}N_3O_3$ in the solution from the absorbance obtained from a solution containing 0.001% w/v of *nitrazepam BPCRS* in a 0.5% v/v solution of *hydrochloric acid* in *methanol* and from the declared content of $C_{15}H_{11}N_3O_3$ in *nitrazepam BPCRS.*

For tablets containing less than 2 mg or less than 2% w/w of Nitrazepam

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Nitrazepam Tablets should be protected from light.

Nitrofurantoin Oral Suspension

General Notices

Action and use

Antibacterial.

DEFINITION

Nitrofurantoin Oral Suspension is a suspension of Nitrofurantoin in a suitable flavoured vehicle.
Nitrofurantoin Oral Suspension should not be diluted.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of nitrofurantoin, $C_8H_6N_4O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 400 nm of the final solution obtained in the Assay exhibits two maxima, at 266 nm and 367 nm.

B. Dissolve 5 mg of the residue obtained by centrifuging a quantity of the oral suspension containing 50 mg of Nitrofurantoin in 5 ml of 0.1M *sodium hydroxide*. A deep yellow solution is produced, which changes to deep orange-red.

ASSAY

Carry out the following procedure in subdued light. To a weighed quantity containing 30 mg of Nitrofurantoin add, in successive small volumes, 50 ml of *dimethylformamide*, stirring well between each addition. Continue stirring until the sample is completely dissolved and dilute to 500 ml with an aqueous solution containing 1.8% w/v of *sodium acetate* and 0.14% v/v of *glacial acetic acid*. Dilute 10 ml of this solution to 100 ml with the sodium acetate-acetic acid solution and measure the *absorbance* of the resulting solution at the maximum at 367 nm, Appendix II B, using in the reference cell a 1% v/v solution of *dimethylformamide* in the sodium acetate-acetic acid solution. Calculate the content of $C_8H_6N_4O_5$ taking 765 as the value of A(1%, 1 cm) at the maximum at 367 nm. Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_8H_6N_4O_5$, weight in volume.

STORAGE

Nitrofurantoin Oral Suspension should be protected from light.

Nitrofurantoin Tablets

General Notices

Action and use

Antibacterial.

DEFINITION

Nitrofurantoin Tablets contain Nitrofurantoin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nitrofurantoin, $C_8H_6N_4O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

The *light absorption*, Appendix II B, in the range 220 to 400 nm of the final solution obtained in the Assay exhibits two maxima, at 266 nm and 367 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* HF_{254} as the coating substance and a mixture of 10 volumes of *methanol* and 90 volumes of *nitromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Nitrofurantoin with 10 ml of a mixture of 1 volume of *dimethylformamide* and 9 volumes of *acetone* and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *acetone*. After removal of the plate, allow it to dry in air, heat at 100° to 105° for 5 minutes and examine under *ultraviolet light* (*254 nm*). Spray the plate with *phenylhydrazine hydrochloride solution* and heat it at 100° to 105° for a further 10 minutes. By each method of visualisation, any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the following procedure in subdued light. Weigh and powder 20 tablets. To a quantity of the powder containing 0.12 g of Nitrofurantoin add 50 ml of *dimethylformamide*, shake for 5 minutes, add sufficient *water* to produce 1000 ml and mix. Dilute 5 ml to 100 ml with a solution containing 1.8% w/v of *sodium acetate* and 0.14% v/v of *glacial acetic acid* and filter. Measure the *absorbance* of the filtrate at the maximum at 367 nm, Appendix II B, using the sodium acetate-acetic acid solution in the reference cell. Calculate the content of $C_8H_6N_4O_5$ taking 765 as the value of A(1%, 1 cm) at 367 nm.

STORAGE

Nitrofurantoin Tablets should be protected from light.

Nizatidine Intravenous Infusion

General Notices

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulcer.

DEFINITION

Nizatidine Intravenous Infusion is a sterile solution of Nizatidine. It is prepared immediately before use from Nizatidine Sterile Concentrate in accordance with the manufacturer's instructions.

The intravenous infusion complies with the requirements stated under Parenteral Preparations.

NIZATIDINE STERILE CONCENTRATE

DEFINITION

Nizatidine Sterile Concentrate is a sterile solution of Nizatidine in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Infusions stated under Parenteral Preparations and with the following requirements.

Content of nizatidine, $C_{12}H_{21}N_5O_2S_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless to yellow solution that darkens on storage.

IDENTIFICATION

Shake a volume of the concentrate containing 50 mg of Nizatidine with 10 ml of *dichloromethane* for 5 minutes. Filter the *dichloromethane* layer through *anhydrous sodium sulphate* and evaporate the filtrate to dryness on a rotary evaporator at 40°. Cool the residue in a refrigerator for 15 hours and, if necessary, induce crystallisation by scratching the wall of the container with a glass rod. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of nizatidine (*RS 410*).

TESTS

Acidity or alkalinity

pH of the concentrate diluted with *water* to contain 1.0% w/v of Nizatidine, 6.0 to 8.0, Appendix V L.

Colour of solution

Dilute the concentrate with *water* to produce a solution containing 1.0% w/v of Nizatidine. The *absorbance* of the solution at 410 nm, Appendix II B, is not more than 0.40 determined using water in the reference cell.

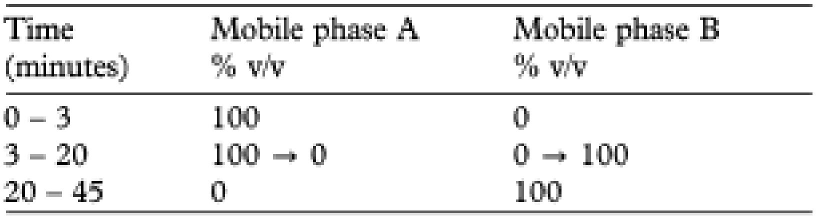
Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the concentrate with mobile phase A to produce a solution containing 0.5% w/v of Nizatidine. For solution (2) dilute 1 volume of solution (1) to 100 volumes with mobile phase A. Solution (3) contains 0.005% w/v of *nizatidine EPCRS* and 0.005% w/v of *nizatidine impurity F EPCRS* in mobile phase A.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelco LC-18-DB and Kromasil C18 are suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute the gradient elution programme described below and (c) a detection wavelength of 254 nm.

Mobile phase A Dissolve 5.9 g of *ammonium acetate* in 760 ml of *water*, add 1 ml of *diethylamine* and adjust the pH to 7.5 with 6M *acetic acid* (solution A). Prepare a mixture of 24 volumes of *methanol* and 76 volumes of solution A.

Mobile phase B A mixture of 50 volumes of *methanol* and 50 volumes of solution A.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v
0 – 3	100	0
3 – 20	100 → 0	0 → 100
20 – 45	0	100

Inject 20 µl of each solution. The test is not valid unless the retention time of Nizatidine is between 10 and 20 minutes and the *symmetry factor* of the peak due to Nizatidine is not greater than 2.0.

Inject 20 µl of solution (3). The test is not valid unless the *resolution factor* between the peak due to Nizatidine (first peak) and Nizatidine impurity F (second peak) is at least 2.0.

In the chromatogram obtained with solution (1), the area of any peak with a relative retention time of about 0.7 (impurity E) is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%), the area of any peak corresponding to impurity F is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%), the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%) and the sum of the areas of all the *secondary peaks* is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) (3.5%). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the concentrate with mobile phase A to produce a solution containing 0.03% w/v of Nizatidine. Solution (2) is a 0.03% w/v solution of *nizatidine EPCRS* in mobile phase A.

The chromatographic procedure described under Related substances may be used.

Inject 20 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to Nizatidine is not greater than 2.0.

Calculate the content $C_{12}H_{21}N_5O_2S_2$, in the concentrate from the chromatograms obtained using the declared content of $C_{12}H_{21}N_5O_2S_2$ in *nizatidine EPCRS.*

STORAGE

Nizatidine Sterile Concentrate should be protected from light.

Noradrenaline Injection / Norepinephrine Injection

General Notices

Action and use

Alpha-adrenoceptor agonist.

DEFINITION

Noradrenaline Injection is a sterile solution of Noradrenaline Acid Tartrate. It is either supplied as a ready-to-use solution or prepared immediately before use by diluting Sterile Noradrenaline Concentrate with Sodium Chloride and Glucose Intravenous Infusion or with Glucose Intravenous Infusion (5.0% w/v) in accordance with the manufacturer's instructions.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

Content of noradrenaline acid tartrate, $C_8H_{11}NO_3,C_4H_6O_6,H_2O$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless liquid.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Mix a volume of the solution containing 1 mg of Noradrenaline Acid Tartrate with 10 ml of *phthalate buffer pH 3.6*, add 1 ml of 0.05M *iodine*, allow to stand for 5 minutes and add 2 ml of 0.1M *sodium thiosulphate*; not more than a very faint red colour is produced. Repeat the test using *phosphate buffer pH 6.6*; a strong reddish violet colour is produced.

TESTS

Acidity

pH, 3.0 to 4.6, Appendix V L.

Adrenaline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection diluted, if necessary, to contain 0.020% w/v of Noradrenaline Acid Tartrate. Solution (2) contains 0.0002% w/v of *adrenaline acid tartrate BPCRS* in the mobile phase. Solution (3) contains 0.0002% w/v of *adrenaline acid tartrate BPCRS* and 0.0002% w/v of *noradrenaline acid tartrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm

× 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate* and 2 ml of 0.1M *disodium edetate* in a mixture of 950 ml of *water* and 50 ml of *methanol* and adjusting the pH to 3.5 with 1M *sodium hydroxide* and (c) a detection wavelength of 205 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to adrenaline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection with the mobile phase, if necessary, to produce a solution containing 0.02% w/v of Noradrenaline Acid Tartrate. Solution (2) contains 0.02% w/v of *noradrenaline acid tartrate BPCRS* in the mobile phase. Solution (3) contains 0.02% w/v of *noradrenaline acid tartrate BPCRS* and 0.02% w/v of *adrenaline acid tartrate BPCRS* in the mobile phase.

The chromatographic procedure described under the test for Adrenaline may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

Calculate the content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ in the injection using the declared content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ in *adrenaline acid tartrate BPCRS*.

STORAGE

The ready-to-use solution should be protected from light. If the solution is brown, it should be discarded.

STERILE NORADRENALINE CONCENTRATE

STERILE NOREPINEPHINE CONCENTRATE

DEFINITION

Sterile Noradrenaline Concentrate is a sterile, isotonic solution containing Noradrenaline Acid Tartrate in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of noradrenaline acid tartrate, $C_8H_{11}NO_3,C_4H_6O_6,H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Mix a volume containing 1 mg of Noradrenaline Acid Tartrate with 10 ml of *phthalate buffer pH 3.6*, add 1 ml of 0.05M *iodine*, allow to stand for 5 minutes and add 2 ml of 0.1M *sodium thiosulphate*; not more than a very faint red colour is produced. Repeat the test using *phosphate buffer pH 6.6*; a strong reddish violet colour is produced.

TESTS

Acidity

pH, 3.0 to 4.6, Appendix V L.

Noradrenalone

Dilute the concentrate with 0.01M *hydrochloric acid* to produce a solution containing 0.1% w/v of Noradrenaline Acid Tartrate. The *absorbance* of the solution measured at 310 nm, Appendix II B, is not greater than 0.17 (0.12%).

Adrenaline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the concentrate being examined diluted, if necessary, to contain 0.2% w/v of Noradrenaline Acid Tartrate. Solution (2) contains 0.002% w/v of *adrenaline acid tartrate BPCRS* in the mobile phase. Solution (3) contains 0.002% w/v of *adrenaline acid tartrate BPCRS* and 0.002% w/v of *noradrenaline acid tartrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 4.0 g of *tetramethylammonium hydrogen sulphate*, 1.1 g of *sodium heptanesulphonate* and 2 ml of 0.1M *disodium edetate* in a mixture of 50 ml of *methanol* and 950 ml of *water* and adjusting the pH to 3.5 with 1M *sodium hydroxide* and (c) a detection wavelength of 205 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to adrenaline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute one volume of the concentrate being examined with the mobile phase to produce a solution containing 0.02% w/v of Noradrenaline Acid Tartrate. Solution (2) contains 0.02% w/v of *noradrenaline acid tartrate BPCRS* in the mobile phase. Solution (3) contains 0.02% w/v of *adrenaline acid tartrate BPCRS* and 0.02% w/v of *noradrenaline acid tartrate BPCRS* in the mobile phase.

The chromatographic procedure described under the test for Adrenaline may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

Calculate the content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ from the chromatograms obtained and using the declared content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ in *noradrenaline acid tartrate BPCRS*.

STORAGE

Sterile Noradrenaline Concentrate should be protected from light. If the solution is brown it should be discarded.

Norethisterone Tablets

General Notices

Action and use

Progestogen.

DEFINITION

Norethisterone Tablets contain Norethisterone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of norethisterone, $C_{20}H_{26}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) crush one tablet in sufficient *ethanol* (*96%*) to produce a final solution containing approximately 0.035% w/v of Norethisterone, warm to 50° for 10 minutes, mix with the aid of ultrasound, allow to cool and centrifuge to obtain a clear supernatant liquid. Solution (2) contains 0.035% w/v of *norethisterone BPCRS* in *ethanol* (*96%*). After removal of the plate, allow it to dry in air and spray with a mixture of 30 volumes of *methanol* and 70 volumes of *sulphuric acid* and examine under *ultraviolet light* (*365 nm*). The Rf value of the principal spot in the chromatogram obtained with solution (1) is the same as that of the spot in the chromatogram obtained with solution (2).

TESTS

Uniformity of content

Tablets containing less than 2 mg of Norethisterone comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.007% w/v of *norethisterone BPCRS* in *methanol* (*60%*). For solution (2) disperse one tablet in 2 ml of *water* with the aid of ultrasound for 15 minutes, add sufficient *methanol* to produce 5 ml, centrifuge for 10 minutes and use the clear supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 28 volumes of *water* and 72 volumes of *methanol* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{20}H_{26}O_2$ in each tablet using the declared content of $C_{20}H_{26}O_2$ in *norethisterone BPCRS*.

ASSAY

For tablets containing less than 2 mg of norethisterone

Calculate the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more of norethisterone

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the conditions described in the test for Uniformity of content and using the following solutions. Solution (1) contains 0.02% w/v of *norethisterone BPCRS* in *methanol* (60%). For solution (2) mix a quantity of the powdered tablets containing 5 mg of Norethisterone in 10 ml of *water* with the aid of ultrasound for 15 minutes, add sufficient *methanol* to produce 25 ml, centrifuge for 10 minutes and use the supernatant liquid.

The chromatographic procedure described under Uniformity of content may be used.

Calculate the content of $C_{20}H_{26}O_2$ using the declared content of $C_{20}H_{26}O_2$ in *norethisterone BPCRS*.

STORAGE

Norethisterone Tablets should be protected from light.

Norfloxacin Eye Drops

General Notices

Action and use

Fluoroquinolone antibacterial.

DEFINITION

Norfloxacin Eye Drops are a sterile solution of Norfloxacin in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of norfloxacin, $C_{16}H_{18}FN_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 400 nm of a solution prepared by diluting the eye drops with 0.1M *hydrochloric acid* to contain 0.006% w/v of Norfloxacin exhibits the same maxima and minima as that of a 0.006% w/v solution of *norfloxacin BPCRS* in 0.1M *hydrochloric acid*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.0 to 5.4, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) dilute a suitable volume of the eye drops with 0.1% v/v *orthophosphoric acid* to produce a solution containing 0.006% w/v of Norfloxacin. Solution (2) contains 0.006% w/v of *norfloxacin BPCRS* in 0.1% v/v *orthophosphoric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Waters µBondapak C18 is suitable) and maintained at 50°, (b) a mixture of 150 volumes of *acetonitrile* and 850 volumes of 0.1% v/v *orthophosphoric acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 278 nm. Inject 10 µl of each solution.

Precondition the column using 0.01M *anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*, at a flow rate of 0.5 ml per minute for 8 hours. Equilibrate the column with the mobile phase for about 30 minutes before starting the chromatography. When the chromatograms are recorded under the conditions described above, the retention time of norfloxacin is about 4 minutes.

The assay is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is less than 2.0.

Inject solution (2) six times. The assay is not valid unless the relative standard deviation of the area of the principal peak is at most 2.0%.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the eye drops using the declared content of $C_{16}H_{18}FN_3O_3$ in *norfloxacin BPCRS*.

STORAGE

Norfloxacin Eye Drops should be protected from light.

Norfloxacin Tablets

General Notices

Action and use

Fluoroquinolone antibacterial.

DEFINITION

Norfloxacin Tablets contain Norfloxacin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of norfloxacin, $C_{16}H_{18}FN_3O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using a silica gel GF_{254} precoated plate which has been previously washed with *methanol* and allowed to dry in air (Analtech plates are suitable) and a mixture of 8 volumes of *water*, 14 volumes of *diethylamine*, 20 volumes of *toluene*, 40 volumes of *chloroform* and 40 volumes of *methanol* as the mobile phase. Apply separately to the plate 50 µl of each of the following solutions. For solution (1) add 2 ml of *water* to a quantity of whole tablets containing 0.4 g of Norfloxacin and disperse with the aid of ultrasound. Add 100 ml of a solution containing 50 volumes of *dichloromethane* and 50 volumes of a solution prepared by adding 9 ml of *hydrochloric acid* to 1000 ml of *methanol*, mix with the aid of ultrasound until a uniform suspension is produced, add sufficient of the same solvent mixture to produce 200 ml and centrifuge 25 ml of the final solution. For solution (2) dissolve, with the aid of ultrasound, 50 mg of *norfloxacin BPCRS* in 15 ml of a solution containing 50 volumes of *dichloromethane* and 50 volumes of a solution prepared by adding 9 ml of *hydrochloric acid* to 1000 ml of *methanol* and add sufficient of the same solvent mixture to produce 25 ml. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm* and *365 nm*). By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) corresponds in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2, protected from light. Use as the medium 750 ml of an acetate buffer solution prepared in the following manner and rotate the paddle at 50 revolutions per minute. Add 14.3 ml of *glacial acetic acid* to 4500 ml of *water*, mix, add slowly with stirring 2.5 ml of a 50% w/v solution of *sodium hydroxide* and add sufficient *water* to produce 5000 ml. If necessary, adjust the pH to 4.0 with *glacial acetic acid* or a 50% w/v solution of *sodium hydroxide*. After 30 minutes, withdraw a sample of 20 ml of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.0016% w/v of Norfloxacin. Measure the *absorbance* of this solution, Appendix II B, at 313 nm using dissolution medium in the reference cell. Calculate the total content of norfloxacin, $C_{16}H_{18}FN_3O_3$, in the medium from the *absorbance* obtained from a 0.0016% w/v solution of *norfloxacin BPCRS* in the dissolution medium and using the declared content of $C_{16}H_{18}FN_3O_3$ in *norfloxacin BPCRS*. The amount of norfloxacin released is not less than 85% of the stated amount.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) add 80 ml of the mobile phase to a quantity of the powdered tablets containing 0.1 g of Norfloxacin, mix with the aid of ultrasound for at least 5 minutes, add sufficient of the mobile phase to produce 200 ml, mix and dilute 10 volumes of this solution to 25 volumes with the mobile phase. Solution (2) contains 0.02% w/v of *norfloxacin BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Waters µBondapak C18 is suitable) maintained at 40°, (b) a mixture of 150 volumes of *acetonitrile* and 850 volumes of 0.1% v/v solution of *orthophosphoric acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 275 nm.

Inject 10 µl of each solution. Precondition the column using 0.01M *anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*, at a flow rate of 0.5 ml per minute for 8 hours. Equilibrate the column with the mobile phase for about 30 minutes before starting the chromatography. When the chromatograms are recorded under the conditions described above, the retention time of norfloxacin is about 5 minutes.

The assay is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is less than 2.0.

Inject solution (2) six times. The assay is not valid unless the relative standard deviation of the area of the principal peak is at most 2.0%.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the tablets using the declared content of $C_{16}H_{18}FN_3O_3$ in *norfloxacin BPCRS*.

STORAGE

Norfloxacin Tablets should be protected from light and moisture.

Norgestrel Tablets

General Notices

Action and use

Progestogen.

DEFINITION

Norgestrel Tablets contain Norgestrel. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of norgestrel.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of norgestrel, $C_{21}H_{28}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) to a quantity of the tablets containing 0.15 mg of Norgestrel add 10 ml of *methanol (80%)*, heat on a water-bath at 60° for 10 minutes, shaking occasionally, allow to cool, dilute with *methanol (80%)* to produce a solution containing 0.00375% w/v of Norgestrel, mix and filter through a membrane with a pore size of 0.45 µm. Solution (2) contains 0.004% w/v of *norgestrel BPCRS* in *methanol (80%)*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution containing equal volumes of *methanol* and 1% w/v of *gamma-cyclodextrin* in *water* and (c) a detection wavelength of 242 nm.

Inject 20 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to levonorgestrel and dextronorgestrel is at least 1.0.

The two principal peaks in the chromatogram obtained with solution (1) have the same retention times as the peaks due to levonorgestrel and dextronorgestrel in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of a mixture of equal volumes of *methanol* and *water* to a quantity of the powdered tablets containing 0.15 mg of Norgestrel, mix with the aid of ultrasound for 30 minutes, stir vigorously for 15 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *methanol* and *water*. Solution (3) contains 0.004% w/v each of *ethinylestradiol BPCRS* and *norgestrel BPCRS* in a mixture of equal volumes of *methanol* and *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable) maintained at 30°, (b) as the mobile phase with a flow rate of 1.2 ml per minute a mixture of 100 volumes of *methanol*, 240 volumes of *acetonitrile* and 500 volumes of *water* and (c) a detection wavelength of 220 nm.

Inject separately 200 µl of each solution. For each solution allow the chromatography to proceed for twice the retention time of norgestrel.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ethinylestradiol and norgestrel is at least 12.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content

Tablets containing less than 2 mg of Norgestrel comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) to 1 tablet add 5 ml of the mobile phase, heat on a water bath at 60° for 15 minutes while shaking, disperse with the aid of ultrasound for 5 minutes, centrifuge and use the clear supernatant liquid. Dilute, if necessary, with the mobile phase to produce a solution containing 0.0015% w/v of Norgestrel. Solution (2) contains 0.0015% w/v of *norgestrel BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1.3 ml per minute a mixture of equal volumes of *acetonitrile* and *water* and (c) a detection wavelength of 220 nm.

Inject 25 µl of each solution.

Calculate the content of $C_{21}H_{28}O_2$ in each tablet using the declared content of $C_{21}H_{28}O_2$ in *norgestrel BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Nortriptyline Capsules

General Notices

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Nortriptyline Capsules contain Nortriptyline Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of nortriptyline, $C_{19}H_{21}N$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 5 mg of nortriptyline with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5% w/v solution of *sodium hydrogen carbonate*, 1 ml of a 2% w/v solution of *sodium periodate* and 1 ml of a 0.3% w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with 1M *sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 265 nm.

B. Triturate a quantity of the contents of the capsules containing the equivalent of 0.1 g of nortriptyline with 10 ml of *chloroform*, filter and evaporate the chloroform. Dissolve 50 mg of the residue in 3 ml of warm *water*, cool and add 0.05 ml of a 2.5% w/v solution of *quinhydrone* in *methanol*. A red colour develops (distinction from amitriptyline).

C. The residue obtained in test B yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Dibenzosuberone

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 3 volumes of *diethylamine*, 15 volumes of *ethyl acetate* and 85 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) extract a quantity of the contents of the capsules containing the equivalent of 20 mg of nortriptyline with 5 ml of a mixture of 1 volume of 2M *hydrochloric acid* and 9 volumes of *ethanol* (*96%*), centrifuge and use the supernatant liquid. Solution (2) contains 0.0010% w/v of *dibenzosuberone* in *ethanol* (*96%*). After removal of the plate, allow it to dry in air until the solvent has evaporated, spray with *sulphuric acid* containing 4% v/v of *formaldehyde solution* and examine immediately under *ultraviolet light* (*365 nm*). Any spot corresponding to dibenzosuberone in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out Method I for *non-aqueous titration*, Appendix VIII A, using a quantity of the mixed contents of 20 capsules containing the equivalent of 0.1 g of nortriptyline, adding 3 ml of *mercury(II) acetate solution* and using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each ml of 0.02M *perchloric acid VS* is equivalent to 5.268 mg of $C_{19}H_{21}N$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of nortriptyline.

Nortriptyline Tablets

General Notices

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Nortriptyline Tablets contain Nortriptyline Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of nortriptyline, $C_{19}H_{21}N$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 5 mg of nortriptyline with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5% w/v solution of *sodium hydrogen carbonate*, 1 ml of a 2% w/v solution of *sodium periodate* and 1 ml of a 0.3% w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with 1M *sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*. The *light absorption* of the resulting trimethylpentane solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 265 nm.

B. Triturate a quantity of the powdered tablets containing the equivalent of 0.1 g of nortriptyline with 10 ml of *chloroform*, filter and evaporate the filtrate to a low volume. Add *ether* until a turbidity is produced and allow to stand. Dissolve 50 mg of the precipitate in 3 ml of warm *water*, cool and add 0.05 ml of a 2.5% w/v solution of *quinhydrone* in *methanol*. A red colour develops (distinction from amitriptyline).

C. The precipitate obtained in test B yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Dibenzosuberone

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 3 volumes of *diethylamine*, 15 volumes of *ethyl acetate* and 85 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 5 µl each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing the equivalent of 20 mg of nortriptyline with 5 ml of a mixture of 1 volume of 2M *hydrochloric acid* and 9 volumes of *ethanol* (*96%*), centrifuge and use the supernatant liquid. Solution (2) contains 0.0010% w/v of *dibenzosuberone* in *ethanol* (*96%*). After removal of the plate, allow it to dry in air until the solvent has evaporated, spray with *sulphuric acid* containing 4% v/v of *formaldehyde solution* and examine immediately under *ultraviolet light* (*365 nm*). Any spot corresponding to dibenzosuberone in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using as solution (1) a 0.025% w/v solution of *nortriptyline hydrochloride BPCRS* in *methanol* (*50%*). For solution (2) add 50 ml of *water* to 20 tablets, shake vigorously until the tablets have completely disintegrated, add 100 ml of *methanol* and shake for 30 minutes. Add sufficient *water* to produce 200 ml, filter and dilute a volume of the filtrate containing the equivalent of 25 mg of nortriptyline to 100 ml with *methanol* (*50%*).

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) a 0.56% w/v solution of *sodium hexanesulphonate* in a mixture of equal volumes of *water* and *acetonitrile* adjusted to pH 4.5 with *glacial acetic acid* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 239 nm.

Calculate the content of $C_{19}H_{21}N$ using the declared content of $C_{19}H_{21}N$ in *nortriptyline hydrochloride BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of nortriptyline.

Nystatin Ointment

General Notices

Action and use

Antifungal.

DEFINITION

Nystatin Ointment is a dispersion of Nystatin in *microfine powder* in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

IDENTIFICATION

Disperse a quantity containing 25,000 IU in 10 ml of *chloroform*, add 40 ml of *methanol* and shake. Filter and dilute 1 ml of the filtrate to 25 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 250 to 350 nm exhibits three maxima, at 291, 305 and 319 nm. The ratios of the *absorbances* at the maxima at 291 nm and 319 nm to the *absorbance* at the maximum at 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use in the reference cell a solution prepared in exactly the same manner but omitting the preparation being examined.

ASSAY

Carry out the following procedure protected from light. Disperse a quantity containing 400,000 IU in 20 ml of *ether* in a stoppered flask, add 70 ml of *dimethylformamide* and shake for 15 minutes. Add 10 ml of *water*, shake vigorously for 2 minutes and filter. Dilute 10 ml of the filtrate to 100 ml with a solution containing 9.56% w/v of *potassium dihydrogen orthophosphate* and 11.5% v/v of 1M *potassium hydroxide* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU.

LABELLING

The strength is stated as the number of IU (Units) per g.

Nystatin Oral Suspension

General Notices

Nystatin Oral Drops

Action and use

Antifungal.

DEFINITION

Nystatin Oral Suspension is a suspension of Nystatin in a suitable flavoured vehicle.

Nystatin Oral Suspension should not be diluted.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

IDENTIFICATION

To a quantity containing 300,000 IU add a mixture of 5 ml of *glacial acetic acid* and 50 ml of *methanol* and shake. Add sufficient *methanol* to produce 100 ml, filter and dilute 1 ml of the filtrate to 100 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 250 to 350 nm exhibits three maxima, at 291, 305 and 319 nm. The ratios of the *absorbances* at the maxima at 291 nm and 319 nm to the *absorbance* at the maximum at 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use in the reference cell a solution prepared in exactly the same manner but omitting the preparation being examined.

ASSAY

Carry out the following procedure protected from light. Dissolve a quantity containing 200,000 IU in sufficient *dimethylformamide* to produce 50 ml, dilute 10 ml to 200 ml with a solution containing 9.56% w/v of *potassium dihydrogen orthophosphate* and 11.5% v/v of 1M *potassium hydroxide* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 95.0% and the lower fiducial limit of error is not more than 120.0% of the stated number of IU.

STORAGE

Nystatin Oral Suspension should be protected from light. It should not be allowed to freeze.

LABELLING

The strength is stated as the number of IU (Units) per ml. The label also states the appropriate directions for using the preparation.

Nystatin Pastilles

General Notices

Action and use

Antifungal.

DEFINITION

Nystatin Pastilles contain Nystatin.

The pastilles comply with the requirements stated under Oromucosal Preparations and with the following requirements.

IDENTIFICATION

Add 100 ml of 0.1M *sodium hydroxide* to a quantity of the pastilles containing 100,000 IU and that have been cut into small pieces, warm on a water bath, shake until dissolved, cool, filter and dilute 1 volume of the filtrate to 50 volumes with 0.1M *sodium hydroxide*. The *light absorption* of the resulting solution, Appendix II B, in the range 250 to 350 nm exhibits three maxima at 291, 305 and 319 nm.

TESTS

Acidity or alkalinity

pH of a solution prepared by dissolving a quantity of the pastilles containing 100,000 IU in *water* at 37° and allowing to cool, 6.0 to 7.5, Appendix V L.

Uniformity of weight

Weigh individually 20 pastilles taken at random and determine the average weight. The weight of not more than one pastille deviates from the average weight by more than 10% and none deviates by more than 15%.

ASSAY

Carry out the following procedure protected from light. Weigh 20 pastilles and cut them into small pieces. Cool a quantity of the pastilles containing 500,000 IU at 5° for 1 hour until hard, add 50 ml of *water* and homogenise. Transfer quantitatively to a 250 ml graduated flask using three 60 ml quantities of *dimethylformamide,* shake for 5 minutes and add sufficient *dimethylformamide* to produce 250 ml. Dilute 10 ml to 100 ml with a solution containing 9.56% w/v of *potassium dihydrogen orthophosphate* and 11.5% v/v of 1M *potassium hydroxide* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90% and the lower fiducial limit of error is not more than 110% of the stated number of IU.

LABELLING

The quantity of active ingredient contained in each pastille is stated as the number of IU

(Units).

Nystatin Pessaries

General Notices

Action and use

Antifungal.

DEFINITION

Nystatin Pessaries are *vaginal tablets* containing Nystatin.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

IDENTIFICATION

To a quantity of the powdered pessaries containing 300,000 IU add a mixture of 5 ml of *glacial acetic acid* and 50 ml of *methanol* and shake. Add sufficient *methanol* to produce 100 ml, filter and dilute 1 ml of the filtrate to 100 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 250 to 350 nm exhibits three maxima, at 291, 305 and 319 nm. The ratios of the *absorbances* at the maxima at 291 nm and 319 nm to the *absorbance* at the maximum at 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use in the reference cell a solution prepared in exactly the same manner but omitting the preparation being examined.

TESTS

Loss on drying

When dried to constant weight at 105°, the powdered pessaries lose not more than 5.0% of their weight. Use 1 g.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 pessaries. Shake a quantity of the powder containing 200,000 IU with 50 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10 ml of the clear supernatant liquid to 200 ml with a solution containing 9.56% w/v of *potassium dihydrogen orthophosphate* and 11.5% v/v of 1M *potassium hydroxide* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 95.0% and the lower fiducial limit of error is not more than 125.0% of the stated number of IU.

LABELLING

The quantity of active ingredient is stated as the number of IU (Units).

Nystatin Tablets

General Notices

Action and use

Antifungal.

DEFINITION

Nystatin Tablets contain Nystatin. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 300,000 IU with a mixture of 5 ml of *glacial acetic acid* and 50 ml of *methanol*, add sufficient *methanol* to produce 100 ml and filter. Dilute 1 ml of the filtrate to 100 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 250 to 350 nm exhibits three maxima, at 291, 305 and 319 nm. The ratios of the *absorbances* at the maxima at 291 nm and 319 nm to the *absorbance* at the maximum at 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use in the reference cell a solution prepared in exactly the same manner but omitting the preparation being examined.

TESTS

Disintegration

Maximum time, 30 minutes, Appendix XII A1, but using a 0.6% v/v solution of *hydrochloric acid* in place of *water*. If the tablets fail to disintegrate, wash them rapidly by immersion in *water* and continue the test using *phosphate buffer pH 6.8*; the tablets then disintegrate within a further 30 minutes.

Loss on drying

When dried at 60° at a pressure not exceeding 0.7 kPa for 3 hours, the powdered tablets lose not more than 5.0% of their weight. Use 1 g.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. Shake a quantity of the powder containing 200,000 IU with 50 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10 ml of the clear, supernatant liquid to 200 ml with a solution containing 9.56% w/v of *potassium dihydrogen orthophosphate* and 11.5% v/v of 1M *potassium hydroxide* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated number of IU.

LABELLING

The quantity of active ingredient is stated as the number of IU (Units).

Camphorated Opium Tincture

General Notices

DEFINITION

Opium Tincture	50 ml
Benzoic Acid	5 g
Racemic Camphor	3 g
Anise Oil or Star Anise Oil	3 ml
Ethanol (60 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Benzoic Acid, the Racemic Camphor and the Anise Oil or Star Anise Oil in 900 ml of Ethanol (60 per cent), add the Opium Tincture and sufficient Ethanol (60 per cent) to produce 1000 ml and mix. Filter, if necessary.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.045 to 0.055% w/v.

TESTS

Ethanol content

56 to 60% v/v, Appendix VIII F, Method III.

Relative density

0.90 to 0.92, Appendix V G.

ASSAY

To 10 ml add 5 ml of *water* and 1 ml of 5M *ammonia* and extract with 30 ml of a mixture of equal volumes of *ethanol* (*96%*) and *chloroform* and then with two 22.5 ml quantities of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*), washing each extract with the same 20 ml of a mixture of equal volumes of *ethanol* (*96%*) and *water*. Evaporate the combined extracts almost to dryness, extract the residue with 10 ml of *calcium hydroxide solution*, filter and wash the filter with 10 ml of *calcium hydroxide solution*. To the combined filtrate and washings add 0.1 g of *ammonium sulphate*, extract with two 10 ml quantities of *ethanol-free chloroform*, wash the combined extracts with 10 ml of *water* and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 ml of 1M *hydrochloric acid*, heat on a water bath to remove any chloroform, cool and dilute to 100 ml with *water*. To 10 ml of this solution add 10 ml of 0.1M *hydrochloric acid* and 8 ml of a freshly prepared 1.0% w/v solution of *sodium nitrite*, allow to stand for 15 minutes, add 12 ml of 5M *ammonia*, dilute to 50 ml with *water* and measure the *absorbance* of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner but using 8 ml of *water* in place of the solution of sodium nitrite. Calculate the content of $C_{17}H_{19}NO_3$ taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

Compound Orange Spirit

General Notices

DEFINITION

Terpeneless Orange Oil	2.5 ml
Terpeneless Lemon Oil	1.3 ml
Anise Oil or Star Anise Oil	4.25 ml
Coriander Oil	6.25 ml
Ethanol (90 per cent)	Sufficient to produce 1000 ml

The spirit complies with the requirements stated under Spirits and with the following requirements.

TESTS

Ethanol content

86 to 90% v/v, Appendix VIII F.

Weight per ml

0.828 to 0.841 g, Appendix V G.

Concentrated Camphorated Opium Tincture

General Notices

DEFINITION

Opium Tincture	400 ml
Benzoic Acid	40 g
Racemic Camphor	24 g
Anise Oil or Star Anise Oil	24 ml
Ethanol (96 per cent)	400 ml
Water	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Benzoic Acid, the Racemic Camphor and the Anise Oil or Star Anise Oil in the Ethanol (96 per cent), add the Opium Tincture and sufficient Water to produce 1000 ml, mix and filter if necessary.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.36 to 0.44% w/v.

TESTS

Ethanol content

54 to 59% v/v, Appendix VIII F, Method III.

Relative density

0.912 to 0.930, Appendix V G.

ASSAY

Dilute 10 ml to 100 ml with *ethanol* (*50%*) and carry out the Assay described under Camphorated Opium Tincture using 10 ml of the diluted solution.

Gastro-resistant Omeprazole Capsules

General Notices

Action and use

Proton pump inhibitor; treatment of peptic ulcer disease.

DEFINITION

Gastro-resistant Omeprazole Capsules contain Omeprazole. They are covered with a gastro-resistant coating or prepared from granules or particles covered with a gastro-resistant coating.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of omeprazole, $C_{17}H_{19}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of finely powdered capsule contents containing 20 mg of Omeprazole with 50 ml of 0.1M *sodium hydroxide,* dilute to 100 ml, filter and further dilute 10 ml to 100 ml. The *light absorption*, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 276 nm and 305 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Carry out the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the media the solutions described sequentially below and rotate the paddles at 100 revolutions per minute.

Mix 11 volumes of 0.25M *trisodium orthophosphate* and 22 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 100 volumes with *water* and adjust the pH, if necessary, to 11.0 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution A).

Mix 1 volume of 10M *sodium hydroxide* with 99 volumes of *0.05M phosphate buffer solution pH 4.5* (solution B).

Mix 5.2 volumes of 1M *anhydrous sodium dihydrogen orthophosphate* and 63.2 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 1000 volumes with *water* and adjust the pH, if necessary, to 7.6 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution C).

First stage (pH 4.5)

Use as the medium 700 ml of *0.05M phosphate buffer solution pH 4.5.* After 45 minutes, withdraw 5 ml of the medium, filter the aliquot, dilute to 25 ml with solution A and retain the samples for analysis as described below. Proceed immediately to the final stage.

Final stage (pH 6.8)

Within 5 minutes, add 200 ml of solution B at 37±0.5° to the vessel. Maintain the rotation speed at 100 revolutions per minute and continue to operate the apparatus for 45 minutes. Withdraw 5 ml of the medium, filter the aliquot, dilute to 25 ml with solution A and retain the samples for analysis as described below.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the sample solutions taken above.

(2) Dissolve a sufficient quantity of *omeprazole BPCRS* in solution A and dilute with *water*; the concentration of the final solution should be the same as that expected for solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (15 cm × 2 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Nucleosil C18 is suitable). Use a suitable guard column.

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.25 ml per minute.

(d) Column temperature of 30°.

(e) Detection wavelength of 302 nm.

(f) Injection volume of 10 µl.

Allow the chromatography to proceed for 8 times the retention time of omeprazole.

MOBILE PHASE

Mix 25 volumes of solution C, 35 volumes of *water* and 40 volumes of *acetonitrile*. Adjust the pH, if necessary, to 7.6 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate.

SYSTEM SUITABILITY

Inject solution (2) six times. The test is not valid unless the relative standard deviation of the areas of the peak due to omeprazole is not more than 2.0% and the *symmetry factor* of the peak due to omeprazole is not more than 2.0.

DETERMINATION OF CONTENT

Calculate the total content of $C_{17}H_{19}N_3O_3S$ in the medium using the declared content of $C_{17}H_{19}N_3O_3S$ in *omeprazole BPCRS*.

LIMITS

The amount of omeprazole released after the first stage is not more than 10% of the stated amount. The amount of omeprazole released after the final stage is not less than 65% (Q) of the stated amount.

Impurity C

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in solvent A.

Prepare a mixture of equal volumes of *methanol* and *dichloromethane* (solvent A).

(1) Weigh the contents of 20 capsules and grind to a fine powder. Disperse a quantity of the powder containing 50 mg of Omeprazole in 15 ml of solvent A, mix with the aid of ultrasound for 30 minutes, dilute with solvent A to produce 20 ml, mix and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of the same solvent.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A. Dilute 1 volume of this solution to 10 volumes with solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel* F_{254} as the coating substance.

(b) The mobile phase is a mixture of 20 volumes of *propan-2-ol*, 40 volumes of *dichloromethane* that has been previously shaken with *concentrated ammonia* (shake 100 ml of *dichloromethane* with 30 ml of *concentrated ammonia* in a separating funnel; allow the layers to separate and use the lower layer) and 40 volumes of *dichloromethane*.

(c) Application volume of 10 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate, dry in air and examine under *ultraviolet light (254 nm)*.

LIMITS

Any spot in the chromatogram obtained with solution (1) with a higher Rf value than that of the spot due to omeprazole is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh the contents of 20 capsules and grind to a fine powder. Disperse a quantity of the powder containing 24 mg of Omeprazole in 150 ml of mobile phase, mix with the aid of ultrasound for 30 minutes, dilute with sufficient mobile phase to produce 200 ml, mix and filter.

(2) Dilute 5 volumes of solution (1) to 100 volumes with the mobile phase. Dilute 1 volume of this solution to 10 volumes with the mobile phase.

(3) Mix 10 mg each of *omeprazole BPCRS* and *omeprazole impurity D EPCRS* in mobile phase and dilute to 100 ml with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (15 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Nucleosil RP8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 280 nm.

(f) Injection volume of 40 µl.

Allow the chromatography to proceed for 3 times the retention time of omeprazole.

MOBILE PHASE

A mixture of 27 volumes of *acetonitrile* and 73 volumes of a 0.14% w/v solution of *disodium hydrogen orthophosphate* that has been previously adjusted to pH 7.6 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity D and omeprazole is greater than 3.0 and the retention time of omeprazole is about 9 minutes.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak due to impurity D or any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). The sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh the contents of 20 capsules and grind to a fine powder. Disperse a quantity of the powder containing 24 mg of Omeprazole in 150 ml of mobile phase, mix with the aid of ultrasound for 30 minutes, dilute with sufficient mobile phase to produce 200 ml, mix and filter and further dilute 10 volumes to 100 volumes with the mobile phase.

(2) 0.0012% w/v of *omeprazole BPCRS* in the mobile phase.

(3) Mix 10 mg each of *omeprazole BPCRS* and *omeprazole impurity D EPCRS* in mobile phase and dilute to 100 ml with the same solvent.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under the test for Related substances may be used but with a detection wavelength of 305 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity D and omeprazole is greater than 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the capsules from the chromatograms obtained and using the declared content of $C_{17}H_{19}N_3O_3S$ in *omeprazole BPCRS*.

IMPURITIES

The impurities limited by this monograph include those listed under Omeprazole.

Gastro-resistant Omeprazole Tablets

General Notices

Action and use

Proton pump inhibitor; treatment of peptic ulcer disease.

DEFINITION

Gastro-resistant Omeprazole Tablets contain Omeprazole. They are covered with a gastro-resistant coating or prepared from granules or particles covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of omeprazole, $C_{17}H_{19}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of powdered tablets containing 20 mg of Omeprazole with 50 ml of 0.1M *sodium hydroxide,* dilute to 100 ml, filter and further dilute 10 ml to 100 ml. The *light absorption*, Appendix II B, in the range 230 to 350 nm exhibits two maxima at 276 nm and 305 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Carry out the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the media the solutions described sequentially below and rotate the paddles at 100 revolutions per minute.

Mix 11 volumes of 0.25M *trisodium orthophosphate* and 22 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 100 volumes with *water* and adjust the pH, if necessary, to 11.0 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution A).

Mix 1 volume of 10M *sodium hydroxide* with 99 volumes of *0.05M phosphate buffer solution pH 4.5* (solution B).

Mix 5.2 volumes of 1M *anhydrous sodium dihydrogen orthophosphate* and 63.2 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 1000 volumes with *water* and adjust the pH, if necessary, to 7.6 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution C).

First stage (pH 4.5)

Use as the medium 700 ml of *0.05M phosphate buffer solution pH 4.5.* After 45 minutes, withdraw 5 ml of the medium, filter the aliquot, dilute to 25 ml with solution A and retain the samples for analysis as described below. Proceed immediately to the final stage.

Final stage (pH 6.8)

Within 5 minutes, add 200 ml of solution B at 37±0.5° to the vessel. Maintain the rotation speed at 100 revolutions per minute and continue to operate the apparatus for 45 minutes. Withdraw 5 ml of the medium, filter the aliquot, dilute to 25 ml with solution A and retain the samples for analysis as described below.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the sample solutions taken above.

(2) Dissolve a sufficient quantity of *omeprazole BPCRS* in solution A and dilute with *water*; the concentration of the final solution should be the same as that expected for solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (15 cm × 2 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Nucleosil C18 is suitable). Use a suitable guard column.

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.25 ml per minute.

(d) Column temperature of 30°.

(e) Detection wavelength of 302 nm.

(f) Injection volume of 10 µl.

Allow the chromatography to proceed for 8 times the retention time of omeprazole.

MOBILE PHASE

Mix 25 volumes of solution C, 35 volumes of *water* and 40 volumes of *acetonitrile*. Adjust the pH, if necessary, to 7.6 ± 0.05 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate.

SYSTEM SUITABILITY

Inject solution (2) six times. The test is not valid unless the relative standard deviation of the areas of the peak due to omeprazole is not more than 2.0% and the *symmetry factor* of the peak due to omeprazole is not more than 2.0.

DETERMINATION OF CONTENT

Calculate the total content of $C_{17}H_{19}N_3O_3S$ in the medium using the declared content of $C_{17}H_{19}N_3O_3S$ in *omeprazole BPCRS*.

LIMITS

The amount of omeprazole released after the first stage is not more than 10% of the stated amount. The amount of omeprazole released after the final stage is not less than 65% (Q) of the stated amount.

Impurity C

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in solvent A.

Prepare a mixture of equal volumes of *methanol* and *dichloromethane* (solvent A).

(1) Disperse a quantity of the powdered tablets containing 50 mg of Omeprazole in 15 ml of solvent A, mix with the aid of ultrasound for 30 minutes, dilute with solvent A to produce 20 ml, mix and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of the same solvent.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A. Dilute 1 volume of this solution to 10 volumes with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel* F_{254} as the coating substance.

(b) The mobile phase is a mixture of 20 volumes of *propan-2-ol*, 40 volumes of *dichloromethane* that has been previously shaken with *concentrated ammonia* (shake 100 ml of *dichloromethane* with 30 ml of *concentrated ammonia* in a separating funnel; allow the layers to separate and use the lower layer) and 40 volumes of *dichloromethane*.

(c) Application volume of 10 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate, dry in air and examine under *ultraviolet light (254 nm)*.

LIMITS

Any spot in the chromatogram obtained with solution (1) with a higher Rf value than that of the spot due to omeprazole is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 24 mg of Omeprazole in 150 ml of mobile phase, mix with the aid of ultrasound for 30 minutes, dilute with sufficient mobile phase to produce 200 ml, mix and filter.

(2) Dilute 5 volumes of solution (1) to 100 volumes with the mobile phase. Dilute 1 volume of this solution to 10 volumes with mobile phase.

(3) Mix 10 mg each of *omeprazole BPCRS* and *omeprazole impurity D EPCRS* in mobile phase and dilute to 100 ml with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (15 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography R* (5 µm) (Nucleosil RP8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 280 nm.

(f) Injection volume of 40 µl.

Allow the chromatography to proceed for 3 times the retention time of omeprazole.

MOBILE PHASE

A mixture of 27 volumes of *acetonitrile* and 73 volumes of a 0.14% w/v solution of *disodium hydrogen orthophosphate* that has been previously adjusted to pH 7.6 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity D and omeprazole is greater than 3.0 and the retention time of omeprazole is about 9 minutes.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak due to impurity D or any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). The sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 24 mg of Omeprazole in 150 ml of mobile phase, mix with the aid of ultrasound for 30 minutes, dilute with sufficient mobile phase to produce 200 ml, mix, filter and further dilute 10 volumes to 100 volumes.

(2) 0.0012% w/v of *omeprazole BPCRS* in mobile phase.

(3) Mix 10 mg each of *omeprazole BPCRS* and *omeprazole impurity D EPCRS* in mobile phase and dilute to 100 ml with the same solvent.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under the test for Related substances may be used but with a detection wavelength of 305 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity D and omeprazole is greater than 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the tablets from the chromatograms obtained and using the declared content of $C_{17}H_{19}N_3O_3S$ in *omeprazole BPCRS*.

IMPURITIES

The impurities limited by this monograph include those listed under Omeprazole.

Olive Oil Ear Drops

General Notices

DEFINITION

Olive Oil Ear Drops are Virgin Olive Oil in a suitable container.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

IDENTIFICATION

Carry out the test for the *identification of fixed oils by thin-layer chromatography*, Appendix X N. The chromatogram obtained from the oil being examined shows spots corresponding to those in the *typical chromatogram* for olive oil. For certain types of olive oil the difference in the sizes of spots E and F is less pronounced than in the figure.

TESTS

Acid value

Not more than 2.0, Appendix X B. Use 5 g.

Light absorption

The *absorbance* of a 1% w/v solution in *cyclohexane* at the maximum at 270 nm is not more than 0.20, Appendix II B. The ratio of the *absorbance* at 232 nm to that at 270 nm is greater than 8.

Peroxide value

Not more than 20.0, Appendix X F.

Relative density

0.910 to 0.916, Appendix V G.

Unsaponifiable matter

Not more than 1.5% w/w when determined by the following method. To 5 g of the oil in a 150-ml flask add 50 ml of 2M *ethanolic potassium hydroxide* and heat under a reflux condenser on a water bath for 1 hour, shaking frequently. Add 50 ml of *water* through the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel, rinsing the flask with 50 ml of *petroleum spirit* (*boiling range, 40° to 60°*) in portions and adding the rinsings to the separating funnel. Shake vigorously for 1 minute, allow to separate and transfer the aqueous layer to a second separating funnel. If an emulsion forms add small quantities of *ethanol* (*96%*) or a concentrated solution of *potassium hydroxide*. Extract the aqueous layer with two 50-ml quantities of *petroleum spirit* (*boiling range, 40° to 60°*) and combine the organic layers in a third separating funnel. Wash with three 50-ml quantities of *ethanol* (*50%*), transfer the petroleum spirit layer to a weighed 250-ml flask, rinse the separating funnel with small quantities of *petroleum spirit* (*boiling range, 40° to 60°*) and add the rinsings to the flask.

Evaporate the solvent on a water bath, dry at 100° to 105° for 15 minutes with the flask in a horizontal position, allow to cool and weigh. Repeat the drying for successive 15-minute periods until the loss in weight between two successive weighings does not exceed 0.1%. Dissolve the residue in 20 ml of *ethanol* (*96%*) previously neutralised to 0.1 ml of *bromophenol blue solution* and, if necessary, titrate with 0.1M *hydrochloric acid VS*. Calculate the percentage content of unsaponifiable matter from the expression

$100(a-0.032b)/w$

where a is the weight, in g, of the residue, b is the volume, in ml, of 0.1M *hydrochloric acid VS* required and w is the weight, in g, of oil taken. The test is not valid if $0.032b$ is greater than 5% of a and must be repeated.

Foreign fixed oils

Carry out the test for *foreign oils by gas chromatography*, Appendix X N. The fatty-acid fraction of the oil has the following composition.

Saturated fatty acids of chain length less than C_{16}: Not more than 0.1%.

Palmitic acid: 7.5 to 20.0%.

Palmitoleic acid (equivalent chain length on polyethylene glycol adipate, 16.3): Not more than 3.5%.

Stearic acid: 0.5 to 5.0%.

Oleic acid (equivalent chain length on polyethylene glycol adipate, 18.3): 56.0 to 85.0%.

Linoleic acid (equivalent chain length on polyethylene glycol adipate, 18.9): 3.5 to 20.0%.

Linolenic acid (equivalent chain length on polyethylene glycol adipate, 19.7): Not more than 1.2%.

Arachidic acid: Not more than 0.7%.

Eicosenoic acid (equivalent chain length on polyethylene glycol adipate, 20.3): Not more than 0.4%.

Behenic acid: Not more than 0.2%.

Lignoceric acid: Not more than 0.2%.

Sterols

Carry out the test for the *determination of sterols*, Appendix X N. The sterol fraction of the oil has the following composition:

sum of contents of β-sitosterol, Δ5,23-stigmastadienol, clerosterol, sitostanol, Δ5-avenasterol and Δ5,24-stigmastadienol: not less than 93.0%.

cholesterol: not more than 0.5%.

Δ7-stigmasterol: not more than 0.5%.

campesterol: not more than 4.0%.

and the content of stigmasterol is not more than that of campesterol.

Sesame oil

Shake 10 ml for about 1 minute with a mixture of 0.5 ml of a 0.35% v/v solution of *furfuraldehyde* in *acetic anhydride* and 4.5 ml of *acetic anhydride* in a cylinder closed with a ground-glass stopper, filter through paper impregnated with *acetic anhydride* and add 0.2 ml of *sulphuric acid* to the filtrate. No bluish green colour develops.

STORAGE

Olive Oil Ear Drops should be kept in a well-filled container and protected from light.

Ondansetron Injection

General Notices

Action and use

Serotonin 5HT$_3$ antagonist; treatment of nausea and vomiting.

DEFINITION

Ondansetron Injection is a sterile solution of Ondansetron Hydrochloride Dihydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ondansetron, $C_{18}H_{19}N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a volume of the injection containing the equivalent of 40 mg of ondansetron add 3 ml of 10M *sodium hydroxide*, shake and filter. Wash the precipitate with *water* and dry at 60° at a pressure of 2 kPa. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of ondansetron *(RS 418)*.

TESTS

Acidity

pH, 3.3 to 4.0, Appendix V L.

Impurity B

Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions in solvent A.

SOLVENT A

0.5 volumes of 13.5M *ammonia,* 100 volumes of *ethanol (96%)* and 100 volumes of *methanol*.

(1) Dilute the injection, if necessary, to give a solution containing the equivalent of 0.2% w/v of ondansetron.

(2) Dilute 1 volume of solution (1) to 50 volumes and dilute 4 volumes of the resulting solution to 20 volumes.

(3) 0.25% w/v solution of *ondansetron for TLC system suitability BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel* F_{254} as the coating.

(b) Use the mobile phase described below.

(c) Apply 100 µl of each solution.

(d) Develop the plate to 15 cm.

(e) Remove the plate, dry in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

2 volumes of 13.5M *ammonia*, 40 volumes of *methanol*, 50 volumes of *ethyl acetate* and 90 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows 3 clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* corresponding to impurity B is not more intense than the spot obtained with solution (2) (0.4%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the injection, if necessary, to give a solution containing the equivalent of 0.1% w/v of ondansetron.

(2) Dilute 1 volume of solution (1) to 50 volumes and further dilute 1 volume of the resulting solution to 10 volumes.

(3) 0.0001% w/v of *imidazole* (impurity E) and 0.0001% w/v of *2-methylimidazole* (impurity F) .

(4) 0.05% w/v of *ondansetron impurity standard BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5µm) (Spherisorb CN is suitable).

(b) Use isocratic elution with the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 216 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

20 volumes of *acetonitrile* and 80 volumes of 0.02M *sodium dihydrogen orthophosphate dihydrate*, previously adjusted to pH 5.4 with 1M *sodium hydroxide.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to impurity E and impurity F is at least 1.3;

and in solution (4):

the *resolution factor* between the peaks due to impurity C and D is at least 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D (the second eluting peak in solution (4)) is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the area of any peak corresponding to impurity C (the first eluting peak in solution (4)) is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the principal peak in solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection in *water BET* to give a solution containing 5 mg of ondansetron per ml (solution A). The endotoxin limit concentration of solution A is 21.88 IU endotoxin per ml.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the injection to give a solution containing the equivalent of 0.01% w/v of ondansetron.

(2) 0.0125% w/v of *ondansetron hydrochloride dihydrate BPCRS*.

(3) 0.05% w/v of *ondansetron impurity standard BPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity C and impurity D is at least 2.5.

Determination of content

Calculate the content of $C_{18}H_{19}N_3O$ in the injection using the declared content of $C_{18}H_{19}N_3O$ in *ondansetron hydrochloride dihydrate BPCRS.* Each mg of $C_{18}H_{19}N_3O$ is equivalent to 1.25 mg $C_{18}H_{19}N_3O,HCl,2H_2O$.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ondansetron Hydrochloride Dihydrate.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ondansetron.

Ondansetron Tablets

General Notices

Action and use

Serotonin $5HT_3$ antagonist; treatment of nausea and vomiting.

DEFINITION

Ondansetron Tablets contain Ondansetron Hydrochloride Dihydrate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ondansetron, $C_{18}H_{19}N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing the equivalent of 30 mg of ondansetron with 20 ml of *acetonitrile,* filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ondansetron hydrochloride *(RS 419)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 ml of *water*, at a temperature of 37 º, as the medium.

PROCEDURE

(1) After 45 minutes, withdraw a 10 ml sample of the medium, and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 310 nm, Appendix II B, using *water* in the reference cell.

(2) Measure the *absorbance* of a 0.01% w/v solution of *ondansetron hydrochloride dihydrate BPCRS* using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of ondansetron, $C_{18}H_{19}N_3O$, in the medium from the absorbances obtained and using the declared content of $C_{18}H_{19}N_3O$, in *ondansetron hydrochloride dihydrate BPCRS.* Each mg of $C_{18}H_{19}N_3O$ is equivalent to 1.25 mg $C_{18}H_{19}N_3O,HCl,2H_2O$.

Impurity B

Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions in solvent A.

SOLVENT A

0.5 volumes of 13.5M *ammonia,* 100 volumes of *ethanol (96%)* and 100 volumes of *methanol.*

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of ondansetron with 25 ml *acetonitrile,* filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in 2 ml of solvent A.

(2) Dilute 1 volume of solution (1) to 50 volumes and dilute 4 volumes of the resulting solution to 20 volumes.

(3) 0.25% w/v solution of *ondansetron for TLC system suitability BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop the plate to 15 cm.

(e) Remove the plate, dry in air and examine under *ultraviolet light (254 nm).*

MOBILE PHASE

2 volumes of 13.5M *ammonia*, 40 volumes of *methanol*, 50 volumes of *ethyl acetate* and 90 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows 3 clearly separated spots.

LIMIT

In the chromatogram obtained with solution (1):

— any *secondary spot* corresponding to impurity B is not more intense than the spot obtained in the chromatogram obtained with solution (2) (0.4%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of ondansetron with 25 ml of *acetonitrile,* filter and evaporate the filtrate to dryness. Dissolve the residue in 20 ml of mobile phase.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase and further dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(3) 0.0001% w/v of *imidazole* (impurity E) and 0.0001% w/v of *2-methylimidazole* (impurity F) in the mobile phase.

(4) 0.05% w/v of *ondansetron impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5µm) (Spherisorb CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 216 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

20 volumes of *acetonitrile* and 80 volumes of 0.02M *sodium dihydrogen orthophosphate dihydrate*, previously adjusted to pH 5.4 with 1M *sodium hydroxide.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity E and impurity F is at least 1.3 and in solution (4) the *resolution factor* between the peaks due to impurity C and impurity D is at least 2.5.

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to impurity D (the second eluting peak in solution (4) is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

— the area of any peak corresponding to impurity C (the first eluting peak in solution (4)) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

— the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of ondansetron with 25 ml of *acetonitrile,* filter and evaporate the filtrate to dryness. Dissolve the residue in 200 ml of mobile phase and dilute 1 volume to 10 volumes with mobile phase.

(2) 0.0125% w/v of *ondansetron hydrochloride dihydrate BPCRS* in the mobile phase.

(3) 0.05% w/v of *ondansetron impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity C and impurity D is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{19}N_3O$ in the tablets using the declared content of $C_{18}H_{19}N_3O$, in *ondansetron hydrochloride dihydrate BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ondansetron Hydrochloride Dihydrate.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ondansetron.

Oral Rehydration Salts

General Notices

Action and use

Prevention and treatment of dehydration.

DEFINITION

Oral Rehydration Salts are *oral powders* containing either Anhydrous Glucose or Glucose, Sodium Chloride, Potassium Chloride and Sodium Citrate or Sodium Bicarbonate. After being dissolved in the requisite volume of Water they are intended for the prevention and treatment of dehydration due to diarrhoea, including maintenance therapy. Oral Rehydration Salts may contain suitable flavouring agents. Where necessary they may also contain suitable flow agents in the minimum quantity required to achieve a satisfactory product.

The composition of one of the formulations in use is described below in terms of the amount in grams to be dissolved in sufficient Water to produce 1000 ml. It is that recommended by the Diarrhoeal Diseases Control Programme of the World Health Organization (WHO) and the United Nations Childrens Fund (UNICEF).

Sodium Chloride	2.6 g
Potassium Chloride	1.5 g
Sodium Citrate	2.9 g
Anhydrous Glucose	13.5 g

The oral powders comply with the requirements stated under Oral Powders and with the following requirements.

Content of potassium, K, sodium, Na, bicarbonate, HCO_3, chloride, Cl, and citrate, $C_6H_5O_7$, as appropriate,

90.0 to 110.0% of the requisite amount, the latter being calculated from the stated amounts of the relevant constituents.

Content of anhydrous glucose, $C_6H_{12}O_6$,

As appropriate 90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. When heated with *cupri-tartaric solution R1* a copious precipitate of copper(I) oxide is produced.

B. Yield reaction B characteristic of *potassium salts*, Appendix VI.

C. Yield reaction A characteristic of *sodium salts*, Appendix VI.

D. Yield reaction A characteristic of *chlorides*, Appendix VI.

E. For preparations containing Sodium Citrate a quantity of the oral powder containing the equivalent of 50 mg of citric acid yields reactions A and B characteristic of *citrates*, Appendix VI.

F. For preparations containing Sodium Bicarbonate add 2 ml of *hydrochloric acid*. A vigorous effervescence is produced.

ASSAY

Carry out the following assays on the well-mixed contents of an individual sachet or on a suitable sample from the well-mixed contents of a bulk container. Where the amount in an individual sachet is insufficient to carry out all the assays, thoroughly mix the contents of sufficient sachets to provide enough material for all of the assays.

For the Assays for potassium, for sodium, for chloride and for bicarbonate dissolve 8 g in sufficient *water* to produce 500 ml (solution A).

For potassium

Dilute a suitable volume of solution A with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm. Use *potassium standard solution* (*600 ppm K*), suitably diluted with the strontium chloride solution, for the standard solutions. Each mg of Potassium Chloride is equivalent to 0.5245 mg of K.

For sodium

Dilute a suitable volume of solution A with a solution of *strontium chloride* such that there is a 1500- to 2000-fold excess of strontium ions in the final solution and determine by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 589 nm. Use *sodium standard solution* (*200 ppm Na*), suitably diluted with the strontium chloride solution, for the standard solutions. Each mg of Sodium Chloride, of Sodium Bicarbonate and of Sodium Citrate is equivalent to 0.3934, 0.2737 and 0.2345 mg of Na respectively.

For chloride

Titrate a suitable volume (50 ml for the formula stated above) of solution A with 0.1M *silver nitrate VS* using a 5% w/v solution of *potassium chromate* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 3.545 mg of Cl. Each mg of Potassium Chloride and of Sodium Chloride is equivalent to 0.4756 mg and 0.6066 mg of Cl respectively.

For citrate

Disperse 2.8 g in 80 ml of *anhydrous acetic acid*, heat to about 50°, cool, dilute to 100 ml with *anhydrous acetic acid*, allow to stand for 10 minutes and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 20 ml of the supernatant liquid and *1-naphtholbenzein solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 6.303 mg of $C_6H_5O_7$. Each mg of Sodium Citrate is equivalent to 0.6430 mg of $C_6H_5O_7$.

For bicarbonate

Titrate 200 ml of solution A with 0.1M *hydrochloric acid VS* using *methyl orange solution* as indicator. Each ml of 0.1M *hydrochloric acid VS* is equivalent to 6.101 mg of HCO_3. Each mg of Sodium Bicarbonate is equivalent to 0.7263 mg of HCO_3.

For glucose

Dissolve 7.5 g in 40 ml of *water*, add 0.5 ml of 1M *ammonia*, dilute to 50 ml with *water*, mix well and allow to stand for not less than 5 hours. If necessary use a suitable method of filtration to obtain a clear solution. Determine the *optical rotation* of the solution, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of $C_6H_{12}O_6$ in the weight taken for the Assay.

STORAGE

Oral Rehydration Salts should be protected from moisture. They should be kept in sachets, preferably made of aluminium foil, containing sufficient for a single dose or for a single day's treatment. Powders for use in hospitals may be presented in bulk containers containing sufficient to produce a volume of solution appropriate to the daily requirements of the establishment concerned.

LABELLING

The label states (1) for sachets the total weights, in grams, of each of the constituents; (2) for bulk containers the weights, in grams, of each of the constituents in a stated quantity, in grams, of the oral powder; (3) the directions for use; (4) that any portion of the solution prepared using the oral powder that remains unused 24 hours after preparation should be discarded.

The label indicates the pharmaceutical form as 'oral powder'.

Orange Syrup

General Notices

DEFINITION

Orange Tincture	60 ml
Syrup	Sufficient to produce 1000 ml

The syrup complies with the requirements stated under Oral Liquids and with the following requirement.

TESTS

Weight per ml

1.29 to 1.31 g, Appendix V G.

Orciprenaline Oral Solution

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Orciprenaline Oral Solution is a solution of Orciprenaline Sulphate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of orciprenaline sulphate, $(C_{11}H_{17}NO_3)_2,H_2SO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds in position, colour and size to that in the chromatogram obtained with solution (5). The test is not valid unless the chromatogram obtained with solution (6) shows a single, compact spot.

B. To 2 ml add 2 ml of a 0.1% w/v solution of *2,6-dichloroquinone-4-chloroimide* in *ethanol* (*96%*) and 1 ml of *sodium carbonate solution*; a violet colour is produced immediately changing to greenish brown and then light brown over a period of 5 minutes. The final colour is not more intense than that of a blank prepared at the same time and in the same manner but using 2 ml of *ethanol* (*96%*) in place of the preparation being examined.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel G precoated plate (Merck plates are suitable) and a mixture of 4 volumes of 13.5M *ammonia*, 16 volumes of *water*, 30 volumes of *propan-2-ol* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) dilute the oral solution, if necessary, with a mixture of 5 volumes of *methanol* and 1 volume of *water* to produce a solution containing 0.20% w/v of Orciprenaline Sulphate. For solution (2) dilute 1 volume of solution (1) to 10 volumes with the same solvent. For solution (3) dilute 1 volume of solution (1) to 200 volumes with the same solvent. Solution (4) contains 0.1% w/v of *methyl 4-hydroxybenzoate* in a mixture of 5 volumes of *methanol* and 1 volume of *water*. Solution (5) contains 0.020% w/v of *orciprenaline sulphate BPCRS* in a mixture of 5 volumes of *methanol* and 1 volume of *water*. For solution (6) mix 1 volume of solution (2) and 1 volume of solution (5). After removal of the plate, allow it to dry in air and expose to iodine vapour until spots appear. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%). Disregard any spot with an Rf value equal to or higher than that of the principal spot in the chromatogram obtained with solution (4). The test is not valid unless the spot in the chromatogram obtained with solution (3) is clearly visible.

ASSAY

To a weighed quantity of the oral solution containing 20 mg of Orciprenaline Sulphate add 5 ml of *water*, extract with 15 ml of *ether*, wash the ether layer with 20 ml of *water*, discard the ether and combine the aqueous layers. To the resulting solution add 10 ml of 0.0167M *potassium bromate VS*, 1 g of *potassium bromide* and 5 ml of *hydrochloric acid*, shake gently for 1 minute, add 0.5 g of *potassium iodide* and titrate with 0.1M *sodium thiosulphate VS* using *starch mucilage* as indicator. Repeat the procedure without the oral solution. The difference between the titrations represents the amount of potassium bromate required. Each ml of 0.0167M *potassium bromate VS* is equivalent to 4.337 mg of $(C_{11}H_{17}NO_3)_2,H_2SO_4$. Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $(C_{11}H_{17}NO_3)_2,H_2SO_4$, weight in volume.

STORAGE

Orciprenaline Oral Solution should be protected from light.

When Orciprenaline Oral Solution is prescribed or demanded, no strength being stated, an Oral Solution containing 10 mg in 5 ml shall be dispensed or supplied.

Orciprenaline Tablets

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Orciprenaline Tablets contain Orciprenaline Sulphate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of orciprenaline sulphate, $(C_{11}H_{17}NO_3)_2,H_2SO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.1 g of Orciprenaline Sulphate with *methanol*, filter and evaporate the filtrate to dryness. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.015% w/v solution of the residue in 0.01M *hydrochloric acid* exhibits a broad maximum at 278 nm. The *absorbance* over the range 276 to 280 nm is about 1.0.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 1.5 volumes of 13.5M *ammonia*, 10 volumes of *water* and 90 volumes of *aldehyde-free methanol* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Orciprenaline Sulphate with 10 ml of *ethanol* (*80%*) for 10 minutes with the aid of ultrasound and filter (Whatman GF/C filter paper is suitable). Solution (2) contains 0.1% w/v of *orciprenaline sulphate BPCRS* in *ethanol* (*80%*). Solution (3) contains 0.1% w/v of each of *orciprenaline sulphate BPCRS* and *salbutamol sulphate BPCRS* in *ethanol* (*80%*). Allow the plate to dry in air and spray with a 1% w/v solution of *potassium permanganate*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

C. The residue obtained in test A yields the reactions characteristic *of sulphates*, Appendix VI.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 4 volumes of 13.5M *ammonia*, 16 volumes of *water*, 30 volumes of *propan-2-ol* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.1 g of Orciprenaline Sulphate with 10 ml of *ethanol* (*80%*) for 10 minutes with the aid of ultrasound and filter (Whatman GF/C filter paper is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with *ethanol* (*80%*). For solution (3) dilute 1 volume of solution (1) to 200 volumes with *ethanol* (*80%*). Allow the plate to dry in air and expose the plate to iodine vapour. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) (1%) and at most one such spot is more intense than the principal spot in the chromatogram obtained with solution (3) (0.5%). Disregard any spot with an Rf value lower than that of the principal spot in the chromatogram obtained with solution (1). The test is not valid unless the spot in the chromatogram obtained with solution (3) is clearly visible.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 80 mg of Orciprenaline Sulphate with 50 ml of 0.01M *hydrochloric acid*, filter and add sufficient 0.01M *hydrochloric acid* to the filtrate to produce 100 ml. Dilute 10 ml to 100 ml with 0.01M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 276 nm, Appendix II B. Calculate the content of $(C_{11}H_{17}NO_3)_2,H_2SO_4$ taking 72.3 as the value of A(1%, 1 cm) at the maximum at 276 nm.

STORAGE

Orciprenaline Tablets should be protected from light.

Organ Preservation Solutions

General Notices

(Solutions for Organ Preservation, Ph Eur monograph 1264)

Ph Eur

DEFINITION

Solutions for organ preservation are sterile, aqueous preparations, intended for storage, protection and/or perfusion of mammalian body organs that are in particular destined for transplantation.

They contain electrolytes that are typically at a concentration close to the intracellular electrolyte composition.

They may contain carbohydrates (such as glucose or mannitol), amino acids, calcium-complexing agents (such as citrate or phosphate), hydrocolloids (such as starch or gelatin derivatives) and other excipients, for example to make the preparation isotonic with blood, to adjust or buffer the pH, to prevent deterioration of the ingredients, but not to adversely affect the intended action of the preparation or, at the concentration used, to cause toxicity or undue local irritation. Solutions for organ preservation may also contain active substances or these may be added immediately before use.

Solutions for organ preservation, examined under suitable conditions of visibility, are clear and practically free from particles.

Solutions for organ preservation may also be presented as concentrated solutions. They are diluted to the prescribed volume with a prescribed liquid immediately before use. After dilution, they comply with the requirements for solutions for organ preservation.

Before use, the solutions for organ preservation are cooled below room temperature, typically to 2 °C to 6 °C, to reduce the temperature of the body organ and its metabolism.

Where applicable, the containers for solutions for organ preservation comply with the requirements for *Materials used for the manufacture of containers (3.1 and subsections)* and *Containers (3.2 and subsections)*. Solutions for organ preservation are supplied in glass containers *(3.2.1)* or in other containers such as plastic containers *(3.2.2 and 3.2.8)*. The tightness of the container is ensured by suitable means. Closures ensure a good seal, prevent the access of micro-organisms and other contaminants and usually permit the withdrawal of a part or the whole of the contents without removal of the closure. The plastic materials or elastomers of which the closure is composed are sufficiently firm and elastic to allow the passage of a needle with the least possible shedding of particles.

PRODUCTION

Solutions for organ preservation are prepared using materials and methods designed to ensure their sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products (5.1.1)*.

Unless otherwise justified and authorised, solutions for organ preservation are prepared from *water for injections R* and do not contain antimicrobial preservatives.

TESTS

pH *(2.2.3)*

Carry out the test at room temperature. The pH of the solution is 5.0 to 8.0.

Osmolality *(2.2.35)*

The osmolality of the solution is 250 mosmol/kg to 380 mosmol/kg.

Hydroxymethylfurfural

If the solution contains glucose, it complies with the following test: to a volume of the preparation to be examined containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance *(2.2.25)*, determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the preparation to be examined.

Particulate contamination

Carry out the test for sub-visible particles *(2.9.19)* using 50 ml of preparation to be examined. The solution contains not more than 50 particles per millilitre larger than 10 µm and not more than 5 particles per millilitre larger than 25 µm.

Products for which the label states that the product is to be used with a final filter are exempted from these requirements.

Sterility *(2.6.1)*

The solution complies with the test for sterility.

Bacterial endotoxins *(2.6.14)*

Less than 0.5 IU/ml.

Pyrogens *(2.6.8)*

Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution, unless otherwise justified and authorised.

LABELLING

The label states:

- — that the solution is not to be used for injection,
- — the formula of the solution for organ preservation expressed in grams per litre and in millimoles per litre,
- — the nominal volume of the solution for organ preservation in the container,
- — the osmolality, expressed in milliosmoles per kilogram,

— that any unused portion of the ready-to-use solution, of the concentrated solution or of the diluted solution must be discarded,

— the storage conditions,

— if applicable, that the solution is to be used in conjunction with a final filter.

In addition, for concentrated solutions the label states that the solution must be diluted with a suitable liquid immediately before use.

Ph Eur

Orphenadrine Hydrochloride Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Orphenadrine Hydrochloride Tablets contain Orphenadrine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of orphenadrine hydrochloride, $C_{18}H_{23}NO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.15 g of Orphenadrine Hydrochloride with *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Dissolve 5 mg in 2 ml of *sulphuric acid*. An orange-red colour is produced.

B. Dissolve 50 mg in 10 ml of *ethanol* (*50%*), add 10 ml of *picric acid solution R1* and allow to stand. The *melting point* of the precipitate, after recrystallisation from *ethanol* (*96%*), is about 89° or about 107°, Appendix V A.

C. Yields reaction A characteristic of *chlorides*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 70 mg of Orphenadrine Hydrochloride as completely as possible in a mixture of 5 ml of *water* and 5 ml of 2M *hydrochloric acid*. Without delay extract with four 15 ml quantities of *chloroform*, filter the combined extracts and evaporate to about 20 ml. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS*, adding 2 ml of *mercury(II) acetate solution* and determining the end point potentiometrically. Each ml of 0.02M *perchloric acid VS* is equivalent to 6.118 mg of $C_{18}H_{23}NO,HCl$.

Oxazepam Tablets

General Notices

Action and use

Benzodiazepine.

DEFINITION

Oxazepam Tablets contain Oxazepam.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of oxazepam, $C_{15}H_{11}ClN_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 20 mg of Oxazepam with 25 ml of *chloroform*, filter, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of oxazepam (*RS 253*).

B. The *light absorption*, Appendix II B, in the range 210 to 350 nm of the solution obtained in the Assay exhibits two maxima, at 230 nm and 316 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, with 0.1M *hydrochloric acid*, at the maximum at 236 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of oxazepam, $C_{15}H_{11}ClN_2O_2$, in the medium taking 1080 as the value of A(1%, 1 cm) at the maximum at 236 nm.

Related substances

Carry out the test protected from light. Carry out the method for *thin-layer chromatography*, Appendix III A, using as the coating substance a suitable silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (Merck silica gel 60 F_{254} is suitable) and a mixture of 10 volumes of *methanol* and 100 volumes of *dichloromethane* as the mobile phase. Before use, wash the plate with *methanol* allowing the solvent front to ascend 17 cm above the line of application. Develop the plate in the same direction as the washing with methanol. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 30 mg of Oxazepam with 6 ml of *acetone* and centrifuge. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *acetone*. For solution (3) dilute 1 volume of solution (1) to 500 volumes with *acetone*. Solution (4) contains 0.10% w/v of each of *oxazepam EPCRS* and *bromazepam EPCRS* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.2%). The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 25 mg of Oxazepam add 150 ml of *ethanol* (*96%*) and shake for 30 minutes. Add sufficient *ethanol* (*96%*) to produce 250 ml, centrifuge, dilute 5 ml of the supernatant liquid to 100 ml with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B. Calculate the content of $C_{15}H_{11}ClN_2O_2$ taking 1250 as the value of A(1%, 1 cm) at the maximum at 230 nm.

STORAGE

Oxazepam Tablets should be protected from light.

Oxprenolol Tablets

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Oxprenolol Tablets contain Oxprenolol Hydrochloride. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of oxprenolol hydrochloride, $C_{15}H_{23}NO_3$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 50 mg of Oxprenolol Hydrochloride add 10 ml of *water* and 2 ml of 1.25M *sodium hydroxide*, extract with 10 ml of *chloroform* and reserve the aqueous layer for test B. Dry the chloroform extract over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of oxprenolol (*RS 255*).

B. The aqueous layer obtained in test A yields reaction A characteristic of *chlorides*, Appendix VI.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 2 volumes of 13.5M *ammonia*, 12 volumes of *methanol* and 88 volumes of *chloroform* as the mobile phase, but allowing the solvent front to ascend 13 cm above the line of application. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Oxprenolol Hydrochloride with 5 ml of *water*, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *water*. Allow the spots to dry in air for 15 minutes before development. After removal of the plate, dry it in a current of warm air for 10 minutes, allow to cool, spray with *anisaldehyde solution*, heat at 100° to 105° for 5 to 10 minutes and examine in daylight. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Mix a quantity of the powder containing 20 mg of Oxprenolol Hydrochloride with 25 ml of 0.1M *hydrochloric acid* and add sufficient *water* to produce 250 ml. Mix with the aid of ultrasound for 5 minutes, shake for 15 minutes and filter. Measure the *absorbance* of the solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{15}H_{23}NO_3$,HCl taking 74.5 as the value of A(1%, 1 cm) at the maximum at 273 nm.

Oxybuprocaine Eye Drops

General Notices

Action and use

Local anaesthetic.

DEFINITION

Oxybuprocaine Eye Drops are a sterile solution of Oxybuprocaine Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of oxybuprocaine hydrochloride, $C_{17}H_{28}N_2O_3,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the eye drops containing 0.4% w/v of Oxybuprocaine Hydrochloride add 0.5 ml of 2M *hydrochloric acid* and 0.5 ml of a 10% w/v solution of *sodium nitrite* and mix. Add a solution prepared by dissolving 0.2 g of *2-naphthol* in the minimum volume of 18M *ammonia*; a red precipitate is produced.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Yield reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 3.5 to 4.3, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the eye drops with sufficient of the mobile phase to produce a solution containing 0.016% w/v of Oxybuprocaine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) mix 1 volume of solution (1) with 1 volume of a 4% w/v solution of *sodium hydroxide* and allow to stand for 20 minutes. Add 1 volume of 2M *orthophosphoric acid*, dilute to 100 volumes with the mobile phase and dilute 1 volume of the final solution to 4 volumes with the mobile phase (generation of 4-amino-3-butoxybenzoic acid).

The chromatographic procedure described under Assay may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of the eye drops with sufficient of the mobile phase to produce a solution containing 0.016% w/v of Oxybuprocaine Hydrochloride. Solution (2) contains 0.016% w/v of *oxybuprocaine hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 40 volumes of *acetonitrile* containing 0.1% v/v of *diethylamine* and 60 volumes of a 0.75% w/v solution of *ammonium acetate* which has been adjusted to pH 5.0 with *glacial acetic acid* and (c) a detection wavelength of 235 nm.

Calculate the content of $C_{17}H_{28}N_2O_3$,HCl in the eye drops using the declared content of $C_{17}H_{28}N_2O_3$,HCl in *oxybuprocaine hydrochloride BPCRS*.

STORAGE

Oxybuprocaine Eye Drops should be protected from light. They should not be allowed to freeze.

Oxybutynin Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Oxybutynin Tablets contain Oxybutynin Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of oxybutynin hydrochloride, $C_{22}H_{31}NO_3,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Mix a quantity of the powdered tablets containing 50 mg of Oxybutynin Hydrochloride with 10 ml of methanol for 10 minutes with the aid of ultrasound, allow to stand for 30 minutes and use the supernatant liquid

(2) Contains 0.05% w/v of oxybutynin hydrochloride BPCRS in methanol.

CHROMATOGRAPHIC PROCEDURE

(a) Use as the coating TLC silica gel F254.

(b) Mobile phase is a mixture of 10 volumes of 18m ammonia, 10 volumes of water, 20 volumes of acetone and 70 volumes of propan-1-ol.

(c) Develop to 15 cm.

(d) Application volume of 10µl for each solution.

(e) Remove the plate, allow it to dry in air and examine under ultraviolet light (254 nm).

COMPARISON

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the powdered tablets containing 50 mg of Oxybutynin Hydrochloride with 40 ml of 0.01M *hydrochloric acid* with the aid of ultrasound for 15 minutes, add sufficient 0.01M *hydrochloric acid* to produce 50 ml, mix and filter (Whatman GF/A filters are suitable).

(2) Contains 0.0015% w/v of *oxybutynin impurity A EPCRS* in 0.01M *hydrochloric acid*.

(3) Contains 0.001% w/v of *phenylcyclohexylglycolic acid BPCRS* in 0.01M *hydrochloric acid*.

(4) Dilute 1 volume of solution (1) to 200 volumes with 0.01M *hydrochloric acid*.

(5) Contains 0.001% w/v of *oxybutynin impurity A EPCRS* in solution (4).

CHROMATOGRAPHIC PROCEDURE

(a) A stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography R1* (5 µm) (Symmetry C18 is suitable)

(b) Gradient elution using the mobile phase programme below.

(c) Flow rate of 1 ml per minute.

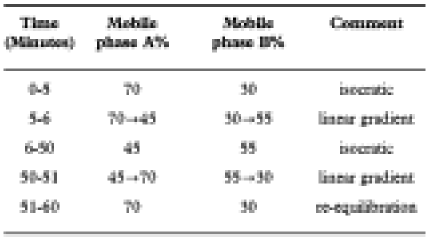
(d) Column temperature ambient.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 50 µl for each solution.

Mobile phase A A solution containing 0.34% w/v of *potassium dihydrogen orthophosphate* and 0.436% of *dipotassium hydrogen orthophosphate*.

Mobile phase B *acetonitrile*.



Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-5	70	30	isocratic
5-6	70→45	30→55	linear gradient
6-50	45	55	isocratic
50-51	45→70	55→30	linear gradient
51-60	70	30	re-equilibration

VALIDITY

System suitability The test is not valid unless, in the chromatogram obtained with solution (5), the retention times are about 31 minutes for oxybutynin hydrochloride and about 47 minutes for oxybutynin impurity A and the *resolution factor* between the peaks due to oxybutynin hydrochloride and oxybutynin impurity A is at least 10.0.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to oxybutynin impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

In the chromatogram obtained with solution (1) the area of any peak corresponding to phenylcyclohexylglycolic acid is not greater than half the area of the peak in the chromatogram obtained with solution (3) (0.5%).

Other impurities The individual area of any other *secondary peak* is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (4) (0.2%) and the sum of the areas of any such *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.5%).

Disregard limit Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix 10 whole tablets with 400 ml of 0.01M *hydrochloric acid* for 20 minutes with the aid of ultrasound, cool, add sufficient 0.01M *hydrochloric acid* to produce 500 ml, mix and filter (Whatman GF/A filters are suitable). Dilute a volume of this solution with sufficient 0.01M *hydrochloric acid* to produce a solution containing 0.005% w/v of Oxybutynin Hydrochloride.

(2) Contains 0.005% w/v of *oxybutynin hydrochloride BPCRS* in 0.01M *hydrochloric acid*.

CHROMATOGRAPHIC PROCEDURE

(a) A stainless steel column (15 cm × 4.6 mm) packed with *nitrile silica gel for chromatography R1* (5 µm) (Spherisorb nitrile is suitable).

(b) Isocratic elution using the mobile phase below.

(c) Flow rate of 2 ml per minute.

(d) Column temperature 40°.

(e) Detection wavelength of 200 nm.

(f) Injection volume of 20 µl for each solution.

Mobile phase A mixture of 300 volumes of *acetonitrile* and 700 volumes of a 0.48% w/v solution of *anhydrous potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 to 3.5 with *orthophosphoric acid*

CALCULATION OF CONTENT

Calculate the content of $C_{22}H_{31}NO_3,HCl$ in the tablets from the chromatograms obtained using the declared content of $C_{22}H_{31}NO_3,HCl$ in *oxybutynin hydrochloride BPCRS*.

Oxymetholone Tablets

General Notices

Action and use

Anabolic steroid; androgen.

DEFINITION

Oxymetholone Tablets contain Oxymetholone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of oxymetholone, $C_{21}H_{32}O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 50 mg of Oxymetholone add 10 ml of *water*, extract with two 10 ml quantities of *chloroform* and evaporate the chloroform extract to dryness. The residue, after drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of oxymetholone (*RS 256*).

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent II* and *mobile phase D*.

ASSAY

Weigh and powder 20 tablets. Extract a quantity of the powder containing 25 mg of Oxymetholone with 0.01M *ethanolic sodium hydroxide* and add sufficient 0.01M *ethanolic sodium hydroxide* to produce 250 ml. Filter if necessary, dilute 5 ml of the filtrate to 50 ml with 0.01M *ethanolic sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 315 nm, Appendix II B. Calculate the content of $C_{21}H_{32}O_3$ taking 547 as the value of A(1%, 1 cm) at the maximum at 315 nm.

STORAGE

Oxymetholone Tablets should be kept free from contact with ferrous metals and protected from light.

Oxytetracycline Capsules

General Notices

Action and use

Tetracycline antibacterial.

DEFINITION

Oxytetracycline Capsules contain Oxytetracycline Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a suitable silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Adjust the pH of a 10% w/v solution of *disodium edetate* to 7.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 ml for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Before use, dry the plate at 110° for 1 hour. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) extract a quantity of the contents of the capsules containing 10 mg of Oxytetracycline Hydrochloride with 20 ml of *methanol*, centrifuge and use the supernatant liquid. For solution (2) dissolve 5 mg of *oxytetracycline hydrochloride EPCRS* in sufficient *methanol* to produce 10 ml. For solution (3) dissolve 5 mg of *oxytetracycline hydrochloride EPCRS* and 5 mg of *demeclocycline hydrochloride EPCRS* in sufficient *methanol* to produce 10 ml. After removal of the plate, dry it in a current of air and examine under *ultraviolet light* (*365 nm*). The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. To 0.5 mg of the contents of the capsules add 2 ml of *sulphuric acid* ; a deep crimson colour is produced. Add 1 ml of *water*; the colour changes to yellow.

C. The contents of the capsules yield the reactions characteristic *of chlorides*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 353 nm, Appendix II B. Calculate the total content of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl, in the medium taking 282 as the value of A (1%, 1 cm) at the maximum at 353 nm.

Light-absorbing impurities

Dissolve a portion of the mixed contents of five capsules as completely as possible in sufficient of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *methanol* to produce two solutions of Oxytetracycline Hydrochloride containing (1) 0.20% w/v and (2) 1.0% w/v and filter each solution. The *absorbance* of the filtrate obtained from solution (1) at 430 nm is not more than 0.75, Appendix II B, calculated with reference to the dried capsule contents. The *absorbance* of the filtrate obtained from solution (2) at 490 nm is not more than 0.40, calculated with reference to the dried capsule contents.

Loss on drying

When dried at 60° at a pressure not exceeding 0.7 kPa for 3 hours, the contents of the capsules lose not more than 5.0% of their weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake, with the aid of ultrasound, a quantity of the mixed contents of 20 capsules containing 0.1 g of Oxytetracycline Hydrochloride with 80 ml of 0.1M methanolic hydrochloric acid prepared by diluting 1 volume of 1M *hydrochloric acid* to 10 volumes with *methanol*. Add sufficient of the methanolic hydrochloric acid to produce 100 ml. Centrifuge and dilute 1 volume of the clear supernatant liquid to 20 volumes with the same solvent. Solution (2) contains 0.005% w/v of *oxytetracycline EPCRS* in the same solvent. Solution (3) contains 0.1% w/v of *4-epioxytetracycline EPCRS* in the same solvent. Solution (4) contains 0.1% w/v of *tetracycline hydrochloride BPCRS* in the same solvent. For solution (5) dilute a mixture containing 1.5 ml of a 0.1% w/v solution of *oxytetracycline EPCRS* in the 0.1M methanolic hydrochloric acid, 1 ml of solution (3) and 3 ml of solution (4) to 25 ml with the same solvent.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 to 10 µm) (Polymer Laboratories, PLRP-S 100A, is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. To 50.0 g of *2-methyl-propan-2-ol* add 200 ml of *water*, 60 ml of *0.33M phosphate buffer pH 7.5*, 50 ml of a 1.0% w/v solution of *tetrabutylammonium hydrogen sulphate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and 10 ml of a 0.04% w/v solution of *disodium edetate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and dilute to 1 litre with *water*.

Inject solution (5). The assay is not valid unless (a) the *resolution factor* between the first peak (4-epioxytetracycline) and the second peak (oxytetracycline) is at least 4.0, (b) the *resolution factor* between the second peak and the third peak (tetracycline) is at least 5.0 (if necessary reduce the content of 2-methylpropan-2-ol in the mobile phase to increase the resolution) and (c) the *symmetry factor* of the peak due to oxytetracycline is not more than 1.25.

Calculate the content of $C_{22}H_{24}N_2O_9$,HCl in the capsules using the declared content of $C_{22}H_{24}N_2O_9$ in *oxytetracycline EPCRS*. Each mg of $C_{22}H_{24}N_2O_9$ is equivalent to 1.079 mg of $C_{22}H_{24}N_2O_9$,HCl.

Oxytetracycline Tablets

General Notices

Action and use

Tetracycline antibacterial.

DEFINITION

Oxytetracycline Tablets contain Oxytetracycline Dihydrate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of oxytetracycline dihydrate, $C_{22}H_{24}N_2O_9,2H_2O$

95.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a suitable silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Adjust the pH of a 10% w/v solution of *disodium edetate* to 7.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 ml for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Before use, dry the plate at 110° for 1 hour. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 10 mg of Oxytetracycline Dihydrate with 20 ml of *methanol*, centrifuge and use the supernatant liquid. For solution (2) dissolve 5 mg of *oxytetracycline hydrochloride EPCRS* in sufficient *methanol* to produce 10 ml. For solution (3) dissolve 5 mg of *oxytetracycline hydrochloride EPCRS* and 5 mg of *demeclocycline hydrochloride EPCRS* in sufficient *methanol* to produce 10 ml. After removal of the plate, dry it in a current of air and examine under *ultraviolet light* (*365 nm*). The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. To 2 mg of the powdered tablets add 2 ml of *sulphuric acid* ; a deep crimson colour is produced. Add 1 ml of *water*; the colour changes to yellow.

C. Shake 4 mg of the powdered tablets with 5 ml of a 1% w/v solution of *sodium carbonate* and add 2 ml of *diazobenzenesulphonic acid solution*. A light brown colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 353 nm, Appendix II B. Calculate the total content of oxytetracycline dihydrate, $C_{22}H_{24}N_2O_9,2H_2O$, in the medium taking 282 as the value of A(1%, 1 cm) at the maximum at 353 nm.

Light-absorbing impurities

Wash five tablets with *water* or *chloroform* until any coloured coating is removed, dry with filter paper and powder. Dissolve portions of the powder as completely as possible in sufficient of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *methanol* to produce two solutions containing (1) 0.20% w/v of Oxytetracycline Dihydrate and (2) 1.0% w/v of Oxytetracycline Dihydrate and filter each solution. The *absorbance* of the filtrate obtained from solution (1) at 430 nm is not more than 0.50 and the *absorbance* of the filtrate obtained from solution (2) at 490 nm is not more than 0.40, Appendix II B.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake, with the aid of ultrasound, a quantity of the powdered tablets containing 50 mg of Oxytetracycline Dihydrate with 40 ml of 0.01M *hydrochloric acid*, add sufficient 0.01M *hydrochloric acid* to produce 50 ml, filter and dilute 1 volume of the clear filtrate to 20 volumes with the same solvent. Solution (2) contains 0.005% w/v of *oxytetracycline EPCRS* in the same solvent. Solution (3) contains 0.1% w/v of *4-epioxytetracycline EPCRS* in the same solvent. Solution (4) contains 0.1% w/v of *tetracycline hydrochloride BPCRS* in the same solvent. For solution (5) dilute a mixture containing 1.5 ml of a 0.1% w/v solution of *oxytetracycline EPCRS* in 0.01M *hydrochloric acid*, 1 ml of solution (3) and 3 ml of solution (4) to 25 ml with the same solvent.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 to 10 µm) (Polymer Laboratories, PLRP-S 100A, is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. To 50.0 g of *2-methyl-propan-2-ol* add 200 ml of *water*, 60 ml of *0.33*M *phosphate buffer pH 7.5*, 50 ml of a 1.0% w/v solution of *tetrabutylammonium hydrogen sulphate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and 10 ml of a 0.04% w/v solution of *disodium edetate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and dilute to 1 litre with *water*.

Inject solution (5). The assay is not valid unless (a) the *resolution factor* between the first peak (4-epioxytetracycline) and the second peak (oxytetracycline) is at least 4.0, (b) the *resolution factor* between the second peak and the third peak (tetracycline) is at least 5.0 (if necessary reduce the content of 2-methylpropan-2-ol in the mobile phase to increase the resolution) and (c) the *symmetry factor* of the peak due to oxytetracycline is not more than 1.25.

Calculate the content of $C_{22}H_{24}N_2O_9,2H_2O$ in the tablets using the declared content of $C_{22}H_{24}N_2O_9$ in *oxytetracycline EPCRS*. Each mg of $C_{22}H_{24}N_2O_9$ is equivalent to 1.078 mg of $C_{22}H_{24}N_2O_9,2H_2O$.

Oxytocin Injection

General Notices

Action and use

Oxytocic.

DEFINITION

Oxytocin Injection is a sterile solution of Oxytocin or a sterile dilution of Oxytocin Bulk Solution in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of oxytocin, $C_{43}H_{66}N_{12}O_{12}S_2$

90.0 to 110.0% of the stated amount of the peptide.

CHARACTERISTICS

A clear, colourless liquid.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a high performance *silica gel G* precoated plate (Merck 5631 plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 6 volumes of *water*, 30 volumes of *methanol* and 70 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 8 cm above the line of application. Prepare a solution containing 17 µg per ml of *oxytocin EPCRS* by dissolving the contents of one vial in the requisite volume of a 1.56% w/v solution of *sodium dihydrogen orthophosphate* (solution A). For solution (1) evaporate 5 ml of the injection on a rotary evaporator at 30° and dissolve the residue in 0.5 ml of *water*.

For injections containing 10 IU per ml prepare solution (2) by evaporating 5 ml of solution A on a rotary evaporator at 30° and dissolving the residue in 0.5 ml of *water.* Apply separately to the plate 1 µl of solutions (1) and (2), dry in a stream of cold air and develop immediately.

For injections containing 5 IU per ml prepare solution (2) by evaporating 2.5 ml of solution A on a rotary evaporator at 30° and dissolving the residue in 0.5 ml of *water.* Apply separately to the plate 2 µl of solutions (1) and (2), dry in a stream of cold air and develop immediately.

For injections containing 1 IU per ml use solution A as solution (2). Apply separately to the plate 10 µl of solutions (1) and (2), dry in a stream of cold air and develop immediately.

After removal of the plate, allow it to dry in a stream of cold air for 10 minutes and develop again in a tank, previously equilibrated for 30 minutes with fresh mobile phase. After removal of the plate, allow it to dry in a stream of warm air for 10 minutes, cool and spray with *phosphomolybdotungstic reagent* until the plate appears translucent. Immediately place the plate in a tank, previously equilibrated for 30 minutes with 13.5M *ammonia,* for 5 minutes, remove and dry in a stream of warm air. The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) exhibits a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

Acidity

pH, 3.5 to 4.5, Appendix V L.

ASSAY

Carry out the Assay for Oxytocin described under Ergometrine and Oxytocin Injection. For the test solution use the injection being examined. For the reference solution dissolve the contents of one vial of *oxytocin EPCRS* in a 1.65% w/v solution of *sodium dihydrogen orthophosphate* to produce a solution containing the same concentration in µg of oxytocin as that stated on the label of the injection. Inject 200 µl of each solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ from the declared content of peptide in *oxytocin EPCRS* and using peak areas.

LABELLING

The strength is stated as the number of IU (Units) per ml. The label also states the equivalent number of micrograms of oxytocin per ml.

Aqueous Phenol Injection

General Notices

DEFINITION

Aqueous Phenol Injection is a sterile solution of Phenol in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenol, C_6H_6O

95.0 to 105.0% w/v of the stated amount.

IDENTIFICATION

To 1 ml add 10 ml of *water* and 0.1 ml of *iron(III) chloride solution R1*. A violet colour is produced which disappears on addition of 5 ml of *propan-2-ol*.

TESTS

Acidity

pH, 3.3 to 6.5, Appendix V L.

ASSAY

Dilute a quantity containing 250 mg of Phenol with sufficient *water* to produce 250 ml, transfer 25 ml to a 500 ml glass-stoppered flask and add 50 ml of 0.05M *bromine VS* and 5 ml of *hydrochloric acid*, stopper, swirl occasionally during 30 minutes and allow to stand for a further 15 minutes. Add 5 ml of a 20% w/v solution of *potassium iodide*, taking care to avoid loss of bromine, shake thoroughly and titrate with 0.1M *sodium thiosulphate VS* until only a faint yellow colour remains. Add 0.1 ml of *starch mucilage* and 10 ml of *chloroform* and complete the titration with vigorous shaking. Repeat the operation without the injection. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of C_6H_6O.

STORAGE

Aqueous Phenol Injection should be protected from light.

LABELLING

The strength is stated as the percentage w/v of Phenol.

Compound Podophyllin Paint

General Notices

DEFINITION

Compound Podophyllin Paint is a *cutaneous solution*.

Podophyllum Resin	150 g
Compound Benzoin Tincture	Sufficient to produce 1000 ml

In making the Compound Benzoin Tincture used to prepare Compound Podophyllin Paint, the Ethanol (90 per cent) may be replaced by Industrial Methylated Spirit[1] diluted so as to be of equivalent ethanolic strength.

The paint complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and a mixture of 1 volume of *methanol* and 25 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate, as bands, 10 µl of each of the following solutions in *methanol* containing (1) 7% v/v of the paint, (2) 0.5% w/v of *podophyllotoxin* and (3) 0.1% w/v of *phenazone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*) to locate the quenching zone due to phenazone in solution (3). Spray the plate with *methanolic sulphuric acid* (*50%*) and heat at 130° for 10 minutes. The chromatogram obtained with solution (1) exhibits a purplish zone (podophyllotoxin) corresponding in position and colour to the principal zone in solution (2) and a purplish zone (4′-demethylpodophyllotoxin) corresponding in position to the quenching zone found in solution (3). Other coloured zones are present in the chromatogram obtained with solution (1).

TESTS

Weight per ml

0.925 to 0.975 g, Appendix V G.

Total solids

27.0 to 33.0% w/v when determined by evaporating 1 ml to dryness on a water bath and drying the residue at 105° for 4 hours.

LABELLING

The label indicates the pharmaceutical form as 'cutaneous solution'.

[1] The law and the statutory regulations governing the use of Industrial Methylated Spirit must be observed.

Concentrated Peppermint Emulsion

General Notices

DEFINITION

Concentrated Peppermint Emulsion is a 2% v/v dispersion of Peppermint Oil in a suitable vehicle containing a non-ionic surface-active agent.

Extemporaneous preparation

The following formula and directions apply.

Peppermint Oil	20 ml
Polysorbate 20	1 ml
Double-strength Chloroform Water	500 ml
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 ml

Shake the Peppermint Oil with the Polysorbate 20 and add gradually, shaking well after each addition, the Double-strength Chloroform Water and sufficient Purified Water to produce 1000 ml.

Dispersible Paracetamol Tablets

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Dispersible Paracetamol Tablets contain Paracetamol in a suitable dispersible basis.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Disperse in *water* to form a uniform suspension.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 257 nm.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 14 cm above the line of application. Apply separately to the plate 40 µl of each of solutions (1), (2) and (3). Pour the mobile phase into the unlined tank, immediately place the prepared plate in the tank and close the tank. For solution (1) add 50 ml of *ethanol* (*96%*) to a quantity of the powdered tablets containing 0.10 g of Paracetamol, shake for 10 minutes, add sufficient *ethanol* (*96%*) to produce 100 ml and filter. Solution (2) contains 0.10% w/v of *paracetamol BPCRS* in *ethanol* (*96%*). For solution (3) dissolve 0.25 g of *4′-chloroacetanilide* and 0.10 g of *paracetamol* in sufficient *ethanol* (*96%*) to produce 100 ml. After removal of the plate, dry it in a current of warm air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots, the spot corresponding to 4′-chloroacetanilide having the higher Rf value.

TESTS

Disintegration

Comply with the requirements for Dispersible Tablets.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) disperse a quantity of powdered tablets containing to 0.2 g of Paracetamol in 8 ml of the mobile phase with the aid of ultrasound, add sufficient mobile phase to produce 10 ml, mix well and filter. For solution (2) dilute 1 volume of solution (1) to 20 volumes with mobile phase and dilute 1 volume of this solution to 20 volumes with mobile phase. Solution (3) contains 0.002% w/v each of *4-aminophenol* and *paracetamol BPCRS* in the mobile phase. Solution (4) contains 0.00002% w/v of *4′-chloroacetanilide* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx C8 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute, with a temperature of 35°C, a mixture of 250 volumes of *methanol* containing 1.15 g of a 40% v/v solution of *tetrabutylammonium hydroxide* with 375 volumes of 0.05M *disodium hydrogen orthophosphate* and 375 volumes of 0.05M *sodium dihydrogen orthophosphate* and (c) a detection wavelength of 245 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

Inject solution (1) and allow the chromatography to proceed for 12 times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-aminophenol is not greater than the area of the corresponding peak in solution (3) (0.1%), the area of any peak corresponding to 4′-chloroacetanilide is not greater than the area of the principal peak in solution (4) (10 ppm) and no other impurity is greater than the area of the principal peak obtained with solution (2) (0.25%).

ASSAY

Weigh and powder 20 tablets. Add 50 ml of 0.1M *sodium hydroxide* slowly to a quantity of the powder containing 0.2 g of Paracetamol, dilute with 100 ml of *water*, shake for 15 minutes and add sufficient *water* to produce 250 ml. Mix, filter and dilute 10 ml of the filtrate to 100 ml with *water*. Add 10 ml of the resulting solution to 10 ml of 0.1M *sodium hydroxide*, dilute to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 257 nm, Appendix II B. Calculate the content of $C_8H_9NO_2$ taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

STORAGE

Dispersible Paracetamol Tablets should be protected from light.

LABELLING

The label states that the tablets should be dispersed in water immediately before use.

Effervescent Potassium Chloride Tablets

General Notices

DEFINITION

Effervescent Potassium Chloride Tablets contain potassium ions and chloride ions in an effervescent basis. The proportion of chloride ions to potassium ions may vary, but the stated molar proportion of chloride ions should be not less than 66% of that of potassium ions.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of potassium ions, K^+

95.0 to 105.0% of the stated amount.

Content of chloride ions, Cl^-

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The powdered tablets yield the reactions characteristic of *potassium salts* and of *chlorides*, Appendix VI.

B. Effervesce on the addition of *water*.

TESTS

Disintegration

The requirement for Disintegration does not apply to Effervescent Potassium Chloride Tablets.

Solution

One tablet dissolves in 100 ml of *water* at 20° with brisk effervescence in not more than 3 minutes. The resulting solution is not more than faintly opalescent.

ASSAY

Weigh and powder 20 tablets.

For potassium ions

Dissolve a quantity of the powder containing 35 mg of potassium ions in sufficient *water* to produce 500 ml. Dilute 5 ml of the resulting solution to 100 ml with a 0.6% w/v solution of *strontium chloride* and determine the content of potassium by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with a 0.6% w/v solution of *strontium chloride*, to prepare the standard solutions.

For chloride ions

Dissolve a quantity of the powder containing 0.12 g of chloride ions in *water*, dilute to 50 ml with *water* and titrate with 0.1M *silver nitrate VS* using *potassium chromate solution* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 3.545 mg of Cl.

LABELLING

The label states (1) the content of potassium ions and the content of chloride ions in terms of the weight and the number of millimoles of ion present in each tablet; (2) that the tablets must be dissolved before administration; (3) directions for dissolving the tablets before administration.

When Effervescent Potassium Chloride Tablets are prescribed or demanded, the amount of potassium required in each tablet must be specified.

Gastro-resistant Pancreatin Tablets

General Notices

Pancreatin Tablets

DEFINITION

Gastro-resistant Pancreatin Tablets contain Pancreatin. They are made gastro-resistant by enteric-coating or by other means.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pancreatin

Not less than 90.0% of the stated minimum numbers of Units of free protease activity, of lipase activity and of amylase activity.

IDENTIFICATION

Triturate a quantity of powdered tablets containing 2.5 g of Pancreatin with 100 ml of *water* and filter. The filtrate complies with the tests described under Pancreatin.

ASSAY

Weigh and powder 20 tablets. Carry out the *assay of pancreatin* described under Pancreatin using in the determination of each activity a quantity of powder estimated to contain the number of Units specified in the method.

STORAGE

Gastro-resistant Pancreatin Tablets should be stored at a temperature of 2° to 8°.

LABELLING

The label states the minimum number of Units of free protease activity, of lipase activity and of amylase activity in each tablet.

Gastro-resistant Peppermint Oil Capsules

General Notices

DEFINITION

Gastro-resistant Peppermint Oil Capsules contain Peppermint Oil. They are enteric capsules. *The capsules comply with the requirements stated under Capsules and with the following requirements.*

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} plate and a mixture of 5 volumes of *ethyl acetate* and 95 volumes of *toluene* as the mobile phase. Apply separately to the plate as bands 20 µl of solution (1) and 10 µl of solution (2). For solution (1) dissolve a quantity of the contents of the capsules containing 0.1 g of Peppermint Oil in sufficient *toluene* to produce 10 ml. For solution (2) dissolve 10 mg of *thymol*, 10 µl of *menthyl acetate*, 20 µl of *cineole* and 50 mg of *menthol* in *toluene* and dilute to 10 ml with the same solvent. Allow the plate to dry in air until the solvent has evaporated and examine under *ultraviolet light* (*254 nm*). The chromatogram obtained with solution (1) may show quenching zones (carvone, pulegone) situated just below the level of the zone (thymol) in the chromatogram obtained with solution (2). Spray with *anisaldehyde solution* and examine in daylight for 5 to 10 minutes while heating at 100° to 105°. The chromatogram obtained with solution (2) shows, in order of increasing Rf value, an intense blue to violet zone (menthol) in the lower third; a violet-blue to brown zone (cineole); a pink zone (thymol); and a violet-blue zone (menthyl acetate). In the chromatogram obtained with solution (1) there is a zone due to menthol (the most intense) and a faint zone due to cineole; at Rf values between those of the cineole and thymol zones in the chromatogram obtained with solution (2), there may be light pink or greyish-blue or greenish-grey zones (carvone, pulegone, isomenthone); in the middle of the chromatogram, there is a violet-blue zone (menthyl acetate) and just below it a greenish-blue zone (menthone); an intense violet-red zone (hydrocarbons) appears near the solvent front and below it there may be a brownish-yellow zone (menthofuran); other less intensely coloured zones may also appear.

B. Examine the chromatograms obtained in the test for Chromatographic profile. The retention time of the principal peaks in the chromatogram obtained with solution (1) is similar to that of the principal peaks in the chromatogram obtained with solution (2). Carvone and pulegone may be absent from the chromatogram obtained with solution (1).

TESTS

Disintegration test

Complies with the requirements stated under Gastro-resistant Capsules.

Refractive index

1.457 to 1.467, determined on the contents of the capsules, Appendix V G.

Relative density

0.900 to 0.916, determined on the contents of the capsules, Appendix V E.

Composition of peppermint oil

Carry out the method for *gas chromatography,* Appendix III B, using the following solutions. For solution (1) use the contents of the capsules. For solution (2) dissolve 0.1 g of *limonene*, 0.2 g of *cineole,* 0.4 g of *menthone*, 0.1 g of *menthofuran*, 0.1 g of *isomenthone*, 0.4 g of *menthyl acetate*, 0.6 g of *menthol*, 0.2 g of *pulegone* and 0.1 g of *carvone* in 1 ml of *hexane*. Prepare immediately before use.

The chromatographic procedure may be carried out using (a) a fused-silica capillary column (60 m × 0.25 mm) coated with *macrogol 20,000* as the bonded phase, maintaining the temperature of the column at 60° for 10 minutes, then raising the temperature at a rate of 2° per minute to 180° and maintaining at 180° for 5 minutes, a split injection system with a split ratio of 100 to 1 and maintaining the temperature of the injection port and of the detector at 220° and (b) *helium* as the carrier gas at a flow rate of 1.5 ml per minute.

Inject about 0.2 µl of solution (2). When the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of solution (2); a type chromatogram is reproduced in the monograph for Peppermint Oil. Record the retention times of these substances.

The test is not valid unless the number of *theoretical plates* calculated from the limonene peak at 110° is at least 30,000 and the *resolution factor* between the peaks corresponding to limonene and cineole is at least 1.5.

Inject about 0.2 µl of solution (1). Using the retention times determined from the chromatogram obtained with solution (2), locate the components of solution (2) on the chromatogram obtained with solution (1) (disregard the peak due to hexane).

Determine the percentage content of the components by the normalisation procedure.

The percentages are within the following ranges:

Limonene	1.0 to 5.0%,
Cineole	3.5 to 14.0%,
Menthone	14.0 to 32.0%,
Menthofuran	1.0 to 9.0%,
Isomenthone	1.5 to 10.0%,
Menthyl acetate	2.8 to 10.0%,
Menthol	30.0 to 55.0%,
Pulegon	Not more than 4.0%,
Carvone	Not more than 1.0%.

The ratio of cineole content to limonene content is greater than 2.

STORAGE

Gastro-resistant Peppermint Oil Capsules should be protected from light.

Gastro-resistant Prednisolone Tablets

General Notices

Enteric-coated Prednisolone Tablets

Action and use

Glucocorticoid.

DEFINITION

Gastro-resistant Prednisolone Tablets contain Prednisolone. They are covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of prednisolone, $C_{21}H_{28}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets with *dichloromethane*, filter and evaporate the filtrate to dryness. The residue complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase A*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak having the same retention time as the peak due to prednisolone in the chromatogram obtained with solution (1).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1. Using the apparatus described under Test A for the *disintegration test for tablets and capsules*, Appendix XII A1, introduce one tablet into each of six tubes and operate the apparatus without the discs for 60 minutes in 0.1M *hydrochloric acid*. Remove the tablets and use these tablets to carry out the dissolution test using 900 ml of *mixed phosphate buffer pH 6.8* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter through a membrane filter having a nominal pore size not greater than 0.45 µm, discarding the first 10 ml of filtrate.

Carry out the method for *liquid chromatography*, Appendix III D, injecting 20 µl of each of the following solutions. For solution (1) prepare a 0.05% w/v solution of *prednisolone BPCRS* in a mixture of 42 volumes of *water* and 58 volumes of *methanol* and dilute with the dissolution medium to contain 0.00025% w/v. For solution (2) use the filtered sample diluted, if necessary, with the dissolution medium to contain 0.00025% w/v of prednisolone.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography,* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 42 volumes of *water* and 58 volumes of *methanol* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

The test is not valid unless the *column efficiency*, determined using the peak due to prednisolone in the chromatogram obtained with solution (1), is greater than 15,000 theoretical plates per metre.

Calculate the content of $C_{21}H_{28}O_5$ in the medium using the declared content of $C_{21}H_{28}O_5$ in *prednisolone BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Prednisolone with 25 ml of *methanol* for 10 minutes and mix with the aid of ultrasound for 2 minutes. Filter the extract (Whatman GF/F is suitable), wash the filter with two 10-ml quantities of *methanol*, combine the filtrate and washings and evaporate to dryness using a rotary evaporator and a warm water bath; dissolve the residue in 10 ml of *tetrahydrofuran* and dilute to 20 ml with *water*. Solution (2) contains 0.002% w/v each of *prednisolone BPCRS* and *hydrocortisone BPCRS* in the mobile phase. For solution (3) dilute 1 volume of solution (1) to 100 volumes with a 50% v/v solution of *tetrahydrofuran*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Alltima C18 is suitable) and maintained at 45 °, (b) as the mobile phase with a flow rate of 1 ml per minute a mixture prepared as follows: mix 220 volumes of *tetrahydrofuran* with 700 volumes of *water*, allow to equilibrate, dilute to 1000 volumes with *water* and mix and (c) a detection wavelength of 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml per minute for about 30 minutes. Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with solution (3) is at least 50% of the full scale of the recorder.

Inject 20 µl of solution (2). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisolone, about 14 minutes and hydrocortisone, about 15.5 minutes. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of tetrahydrofuran in the mobile phase.

Inject separately 20 µl of a 50% v/v solution of *tetrahydrofuran* as a blank, 20 µl of solution (1) and 20 µl of solution (3). Continue the chromatography for 4.5 times the retention time of the principal peak.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%) and the sum of the areas of any such peaks is not greater than four times the area of the principal peak in the chromatogram obtained with solution (3) (4%). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%) and any peak with a retention time of 5 minutes or less.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.005% w/v of *prednisolone BPCRS* and 0.0075% w/v of *dexamethasone* (internal standard) in a mixture of 42 volumes of *water* and 58 volumes of *methanol*. For solution (2) add 58 ml of *methanol* to a quantity of the powder containing 5 mg of Prednisolone, shake for 10 minutes, add sufficient *water* to produce 100 ml, mix and filter. Prepare solution (3) in the same manner as solution (2) but add 10 ml of a 0.075% w/v solution of *dexamethasone* in *methanol* and 48 ml of *methanol* in place of the 58 ml of methanol.

The chromatographic procedure described under Dissolution may be used.

The assay is not valid unless in the chromatogram obatained with solution (1), the *resolution factor* between the peaks due to prednisolone and dexamethasone is greater than 2.5 and the *column efficiency*, determined using the peak due to prednisolone is greater than 15,000 theoretical plates per metre.

Calculate the content of $C_{21}H_{28}O_5$ in the tablets using the declared content of $C_{21}H_{28}O_5$ in *prednisolone BPCRS*.

LABELLING

The label states that the tablets should be swallowed whole and not chewed.

Light Liquid Paraffin Eye Drops

General Notices

DEFINITION

Light Liquid Paraffin Eye Drops are Light Liquid Paraffin in a suitable container.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

TESTS

Acidity or alkalinity

To 10 ml add 20 ml of boiling *water* and shake vigorously for 1 minute. Separate the aqueous layer and filter. To 10 ml of the filtrate, add 0.1 ml of *phenolphthalein solution*. The solution is colourless. Not more than 0.1 ml of 0.1M *sodium hydroxide VS* is required to change the colour to pink.

Relative density

0.810 to 0.875, Appendix V G.

Viscosity

25 mPa.s to 80 mPa.s, Appendix V H, Method II.

Solid paraffins

Dry a suitable quantity of the eye drops by heating at 100° for 2 hours and cool in a desiccator over *sulphuric acid* . Place in a glass tube with an internal diameter of about 25 mm, close the tube and immerse in a bath of iced water. After 4 hours, the liquid is sufficiently clear for a black line, 0.5 mm wide, to be easily seen against a white background held vertically behind the tube.

STORAGE

Light Liquid Paraffin Eye Drops should be protected from light.

Liquid Paraffin and Magnesium Hydroxide Oral Emulsion

General Notices

DEFINITION

Liquid Paraffin and Magnesium Hydroxide Oral Emulsion is a 25% v/v dispersion of Liquid Paraffin in an aqueous suspension containing 6% w/w of hydrated magnesium oxide prepared from a suitable grade of Light Magnesium Oxide.

Extemporaneous preparation

The following formula and directions apply.

Liquid Paraffin	250 ml
Chloroform Spirit	15 ml
Magnesium Hydroxide Mixture	Sufficient to produce 1000 ml

Mix the Chloroform Spirit with 650 ml of Magnesium Hydroxide Mixture, add to the Liquid Paraffin, add sufficient Magnesium Hydroxide Mixture to produce 1000 ml and pass through a homogeniser.

The oral emulsion complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium hydroxide, $Mg(OH)_2$

5.1 to 7.0% w/w.

Content of liquid paraffin

19.7 to 24.0% w/w.

ASSAY

For magnesium hydroxide

Dilute 4 g with 50 ml of *water*, shake with 25 ml of 0.5M *hydrochloric acid VS* and titrate with 0.5M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each ml of 0.5M *hydrochloric acid VS* is equivalent to 14.58 mg of $Mg(OH)_2$.

For liquid paraffin

Extract the neutralised liquid obtained in the Assay for magnesium hydroxide with three 25 ml quantities of a mixture of equal volumes of *petroleum spirit* (*boiling range, 40° to 60°*) and *ether*, wash the combined extracts with two 10 ml quantities of *water*, discard the washings, evaporate the solvent, add 5 ml of *acetone* and again evaporate. Repeat the addition and evaporation of *acetone* until the residue is free from water, dry at 105° for 15 minutes and weigh.

Liquid Paraffin Oral Emulsion

General Notices

Liquid Paraffin Emulsion

DEFINITION

Liquid Paraffin	500 ml
Vanillin	500 mg
Chloroform	2.5 ml
Benzoic Acid Solution	20 ml
Methylcellulose 20	20 g
Saccharin Sodium	50 mg
Water	A sufficient quantity

Extemporaneous preparation

The following directions apply.

Heat about 120 ml of Water until it boils and add the Methylcellulose; when thoroughly hydrated add sufficient Water in the form of ice to produce 350 ml and stir until homogeneous. Mix the Chloroform and the Benzoic Acid Solution, dissolve the Vanillin in the mixture and add to the methylcellulose dispersion while stirring vigorously for 5 minutes. Add the Saccharin Sodium dissolved in Water and dilute to 500 ml with Water. Add the Liquid Paraffin, stirring constantly, and pass through a homogeniser.

The oral emulsion complies with the requirements stated under Oral Liquids and with the following requirements.

Content of liquid paraffin

44.0 to 49.0% w/w.

ASSAY

To 5 g add 10 ml of *water*, extract with two 40 ml quantities of a mixture of 2 volumes of *ethanol (96%)*, 3 volumes of *petroleum spirit* (*boiling range, 40° to 60°*) and 3 volumes of *ether* and then with 30 ml of a mixture of equal volumes of *petroleum spirit* (*boiling range, 40° to 60°*) and *ether*. Wash the combined extracts with 15 ml of 0.5M *sodium hydroxide* and then with 15 ml of *water*, evaporate the solvent, add 5 ml of *acetone* and evaporate again. Repeat the addition and evaporation of *acetone* until the residue is free from water, dry at 105° for 15 minutes and weigh.

Oily Phenol Injection

General Notices

DEFINITION

Oily Phenol Injection is a sterile solution containing 5% w/v of Phenol in a suitable fixed oil.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenol, C_6H_6O

4.75 to 5.25% w/v.

ASSAY

Dissolve 8 g in 50 ml of *ether* and extract with successive 10 ml quantities of 2M *sodium hydroxide* until extraction is complete, boil the combined extracts for 2 minutes, cool and dilute to 250 ml with *water*. To 20 ml of this solution in a glass-stoppered flask add 30 ml of 0.05M *bromine VS* and 6 ml of *hydrochloric acid*, stopper, shake repeatedly during 15 minutes and allow to stand for a further 15 minutes. Add 30 ml of *dilute potassium iodide solution*, taking care to avoid loss of bromine, and titrate the liberated iodine with 0.1M *sodium thiosulphate VS*. Repeat the operation without the injection. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O. Determine the *weight per ml*, Appendix V G, and calculate the percentage w/v of C_6H_6O.

Paediatric Paracetamol Oral Solution

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Paediatric Paracetamol Oral Solution is a solution containing 2.4% w/v of Paracetamol in a suitable flavoured vehicle.

Paediatric Paracetamol Oral Solution should not be diluted.
The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

2.28 to 2.52% w/v.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the preparation being examined with *methanol* to produce a solution containing 0.24% w/v Paracetamol and filter if necessary.

(2) 0.24% w/v of *paracetamol BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop to 15 cm.

(e) Remove the plate, dry it in a current of warm air, examine under *ultraviolet light* (*254 nm*) and also reveal the spots using *Method 1.*

MOBILE PHASE

0.5 volume of *glacial acetic acid*, 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform.*

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to paracetamol in the chromatogram obtained with solution (1).

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake 5 ml of the preparation being examined with 15 ml of the mobile phase, dilute to 25 ml with the mobile phase and filter if necessary.

(2) 0.0024% w/v of *4-aminophenol* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 2.0 ml per minute.

(d) Use ambient column temperature.

(e) Detection wavelength of 272 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01M *sodium butanesulphonate* in a mixture of 0.4 volumes of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water.*

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%);

— peaks with a long retention time may occur due preservatives in the preparation.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a weighed quantity of the preparation being examined containing 24 mg of Paracetamol with 100 ml of the mobile phase, dilute to 200 ml with the mobile phase and filter if necessary.

(2) 0.012% w/v of *paracetamol BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using the conditions described in the test for 4-Aminophenol but using a detection wavelength of 243 nm.

Determine the *weight per ml* of the preparation, Appendix V G, and calculate the percentage content of $C_8H_9NO_2$, weight in volume, using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

STORAGE

Paediatric Paracetamol Oral Solution should be protected from light. It should not be refrigerated.

Paediatric Phenobarbital Oral Solution

General Notices

NOTE: There are currently no licensed formulations in the United Kingdom.

Action and use

Barbiturate.

DEFINITION

Paediatric Phenobarbital Oral Solution is an *oral solution* containing Phenobarbital Sodium in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of phenobarbital, $C_{12}H_{12}N_2O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, of the residue obtained in the Assay is concordant with the *reference spectrum* of phenobarbital (*RS 270*).

B. The oral solution yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Alkalinity

pH, 7.5 to 9.0, Appendix V L.

ASSAY

Acidify 50 ml of the preparation being examined to *litmus paper* with 2M *hydrochloric acid* and extract with four 25-ml quantities of *ether*. Wash the combined ether extracts with two 2-ml quantities of *water* and wash the combined aqueous washings with 10 ml of *ether*. Add the ether washings to the combined ether extracts, evaporate the ether and dry the residue of phenobarbital, $C_{12}H_{12}N_2O_{3.}$ to constant weight at 105°. Calculate the content of $C_{12}H_{12}N_2O_3$ in the oral solution as a percentage of the stated amount.

STORAGE

Paediatric Phenobarbital Oral Solution should be protected from light. It should not be refrigerated.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of phenobarbital.

Pamidronate Disodium Intravenous Infusion

General Notices

Action and use

Bisphosphonate; treatment of osteolytic lesions; Paget′s disease; hypercalcaemia of malignancy.

DEFINITION

Pamidronate Disodium Intravenous Infusion is a sterile solution of Pamidronate Disodium in Water for Injections. It is prepared by dissolving Pamidronate Disodium for Intravenous Infusion in Water for Injections and then diluting with the requisite volume of a suitable diluent in accordance with the manufacturer's instructions.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 10 mg of anhydrous pamidronate disodium per ml (solution A). The endotoxin limit concentration of solution A is 30 IU of endotoxin per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

STORAGE

Pamidronate Disodium Intravenous Infusion should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

PAMIDRONATE DISODIUM FOR INTRAVENOUS INFUSION

DEFINITION

Pamidronate Disodium for Intravenous Infusion is a sterile material prepared from Pamidronate Disodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of anhydrous pamidronate disodium, $C_3H_9NNa_2O_7P_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a precoated cellulose plate (Avicel F1440 precoated 10 cm × 10 cm sheets are suitable) and a mixture of 1 g of *trichloroacetic acid*, 5 ml of 13.5M *ammonia*, 40 ml of *water* and 55 ml of *methanol* as the mobile phase. Before use, place the plate in an unlined tank and allow the mobile phase to ascend to the top of the sheet, dry it for 30 minutes in a current of warm air at about 50° and allow it to cool. Use with the flow of mobile phase in the same direction as that used for the prewash and use the same chamber and mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dissolve a quantity of the contents of the sealed container in sufficient *water* to produce a solution containing 0.3% w/v of anhydrous pamidronate disodium. Solution (2) contains 0.4% w/v of *disodium pamidronate BPCRS* in *water*. Allow the mobile phase to ascend 8 cm above the line of application. After removal of the plate, dry in a current of warm air for 30 minutes, spray with a solution prepared by dissolving 1 g of *ammonium molybdate* in 85 ml of *water* and adding 10 ml of *hydrochloric acid* and 5 ml of a 60% v/v solution of *perchloric acid*, heat at 80° for 10 minutes, allow to cool and expose to *ultraviolet light (365 nm)* for 2 minutes; examine the plate in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to pamidronate disodium in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

Dissolve the contents of a sealed container in sufficient *water* to produce a solution containing the equivalent of 0.3% w/v of anhydrous pamidronate disodium. The pH of the solution is 6.0 to 7.0, Appendix V L.

β-Alanine

Carry out the method for *thin-layer chromatography* under subdued light, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 4 volumes of 13.5M *ammonia*, 8 volumes of *di-isopropyl ether* and 9 volumes of *methanol* as the mobile phase but allowing the solvent front to ascend 7 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dissolve the contents of a sealed container in sufficient *water* to produce a solution containing the equivalent of 0.30% w/v of anhydrous pamidronate disodium. Solution (2) contains 0.0015% w/v of *3-aminopropionic acid*. After removal of the plate, allow it to dry in a current of warm air and spray with a 0.01% w/v solution of *fluorescamine* in *acetone*, immerse the plate for 2 seconds in a mixture of 1 volume of *liquid paraffin* and 2 volumes of n-*hexane*, allow to dry in air for 15 minutes and examine under *ultraviolet light (365 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to β-alanine (3-aminopropionic acid) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Determine the weight of the mixed contents of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations, Powders for Injections.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the mixed contents of the 10 containers in *water* and dilute with the same solvent to produce a solution containing the equivalent of 0.20% w/v of anhydrous pamidronate disodium. Solution (2) contains 0.20% w/v of *disodium pamidronate BPCRS* in *water.*

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm

× 4.6 mm) packed with an anion-exchange stationary phase (5 µm) (IC Anion Super-sep is suitable) and maintained at 35^{c}, (b) as the mobile phase with a flow rate of 1.0 ml per minute a solution prepared by adding 0.47 ml of *formic acid* to 2500 ml of *water* and adjusting the solution to pH 3.5 with 2M *sodium hydroxide* and (c) a refractive index detector. Inject 100 µl of each solution.

Calculate the content of $C_3H_9NNa_2O_7P_2$ in a container of average content weight from the chromatograms obtained and using the declared content of $C_3H_9NNa_2O_7P_2$ in *disodium pamidronate BPCRS.*

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous pamidronate disodium.

IMPURITIES

The impurities limited by the requirements of this monograph include β-alanine.

Pancreatin Granules

General Notices

Action and use

Enzyme; treatment of pancreatic exocrine deficiency.

DEFINITION

Pancreatin Granules contain Pancreatin and may also contain suitable gastro-resistant substances.

The granules comply with the requirements stated under Granules and with the following requirements.

Content of pancreatin

Not less than 90.0% of the stated minimum number of Units of free protease activity, of lipase activity and of amylase activity.

IDENTIFICATION

Triturate a quantity of powdered granules containing 2.5 g of Pancreatin with 100 ml of *water*. The liquid complies with the tests described under Pancreatin.

ASSAY

Carry out the *assay of pancreatin* described under Pancreatin using in the determination of each activity a quantity of the powdered granules estimated to contain the number of Units specified in the method.

STORAGE

Pancreatin Granules should be stored at a temperature of 2° to 8°.

LABELLING

The label states (1) the minimum number of Units of free protease activity, of lipase activity and of amylase activity per g; (2) where applicable, that the granules contain gastro-resistant substances.

Pancuronium Injection

General Notices

Action and use

Non-depolarizing neuromuscular blocker.

DEFINITION

Pancuronium Injection is a sterile solution of Pancuronium Bromide in Sodium Chloride Intravenous Infusion.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of pancuronium bromide, $C_{35}H_{60}Br_2N_2O_4$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless liquid.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to the principal spot in the chromatogram obtained with solution (2).

B. To a volume containing 5 mg of Pancuronium Bromide, diluted if necessary to 10 ml with *water*, add 10 ml of *1,2-dichloroethane* followed by 1 ml of *methyl orange solution*. Shake, centrifuge, allow the layers to separate and acidify the organic layer with 1M *sulphuric acid*. A red colour is produced.

C. Yields reaction A characteristic of *bromides*, Appendix VI.

TESTS

Acidity

pH, 3.8 to 4.2, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Evaporate a volume of the injection containing 20 mg of Pancuronium Bromide to dryness in a current of *nitrogen*, add 2 ml of *acetonitrile* to the residue and mix with the aid of ultrasound for 1 minute.

(2) 1.0% w/v of *pancuronium bromide BPCRS* in *acetonitrile*.

(3) Dilute 1 volume of solution (1) to 50 volumes with *acetonitrile*.

(4) Dilute 1 volume of solution (3) to 2 volumes with *acetonitrile*.

(5) 3% w/v of *pancuronium bromide for system suitability EPCRS* (containing 1.0 per cent of impurity D) in *methylene chloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 2 µl of each solution.

(d) Develop the plate to 15 cm in an unsaturated tank.

(e) After removal of the plate, dry it in a current of cold air and spray with a 1% w/v solution of *sodium nitrite* in *methanol*. Allow to stand for 2 minutes, spray the plate with *potassium iodobismuthate solution* and dry in a current of cold air.

MOBILE PHASE

5 volumes of a 20% w/v solution of *sodium iodide*, 10 volumes of *acetonitrile* and 85 volumes of *propan-2-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows two distinct spots and the Rf value of the spot due to impurity D relative to that due to pancuronium bromide is at least 1.2.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to dacuronium bromide (impurity A) or vecuronium bromide (impurity D) is not more intense than the spot in the chromatogram obtained with solution (5) (3%). Impurity A and impurity D have the same Rf value and if present in the same solution would produce a single spot;

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (1%).

ASSAY

To a volume containing 4 mg of Pancuronium Bromide add 1 ml of a 13.9% w/v solution of *hydroxylamine hydrochloride* followed by 1 ml of a 15% w/v solution of *sodium hydroxide*. Allow to stand for 10 minutes and then add 1 ml of a solution prepared by diluting *hydrochloric acid* with *water* to contain 12.76% w/v of HCl. Add 1 ml of a 10% w/v solution of *iron(III) chloride* in 0.1M *hydrochloric acid*, add sufficient *water* to produce 25 ml, centrifuge and measure the *absorbance* of the clear, supernatant liquid at the maximum at 510 nm, Appendix II B, using in the reference cell a solution prepared by carrying out the operation using an equal volume of *water* in place of the injection. Calculate the content of $C_{35}H_{60}Br_2N_2O_4$ from the *absorbance* obtained by repeating the operation using a suitable quantity of *pancuronium bromide BPCRS* dissolved in *water* and using the declared content of $C_{35}H_{60}Br_2N_2O_4$ in *pancuronium bromide BPCRS*.

STORAGE

Pancuronium Injection should be stored at a temperature of 2° to 8°.

Papaveretum Injection

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Papaveretum Injection is a sterile solution of Papaveretum in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of morphine, $C_{17}H_{19}NO_3$

59.7 to 69.3% of the stated amount of Papaveretum.

Content of papaverine, $C_{20}H_{21}NO_4$

6.2 to 7.7% of the stated amount of Papaveretum.

Content of codeine, $C_{18}H_{21}NO_3$

4.9 to 5.9% of the stated amount of Papaveretum.

CHARACTERISTICS

A clear, colourless to yellowish brown solution.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of 13.5M *ammonia,* 6 volumes of *ethanol (96%),* 40 volumes of *acetone* and 40 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. Solution (1) is the injection diluted, if necessary, to contain 1.6% w/v of Papaveretum. Solutions (2), (3) and (4) are solutions in *water* containing (2) 1.28% w/v of *morphine sulphate BPCRS*, (3) 0.115% w/v of *papaverine hydrochloride BPCRS* and (4) 0.10% w/v of *codeine hydrochloride BPCRS*. After removal of the plate, dry it at 100° to 105° for 15 minutes, allow to cool and spray with *potassium iodobismuthate solution* and then with a 0.4% v/v solution of *sulphuric acid*. The chromatogram obtained with solution (1) shows three principal spots corresponding to the principal spots in the chromatograms obtained with solutions (2), (3) and (4).

Acidity

pH, 2.5 to 4.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution (1) contains 0.128% w/v of *morphine sulphate BPCRS*, 0.0115% w/v of *papaverine hydrochloride BPCRS* and 0.010% w/v of *codeine hydrochloride BPCRS* in *methanol* (*60%*). Solution (2) contains 0.128% w/v of *morphine sulphate BPCRS* in *methanol* (*60%*). For solution (3) dilute a volume of the injection containing 80 mg of Papaveretum to 50 ml with *methanol* (*60%*).

The chromatographic procedure may be carried out using a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 0.01M *sodium acetate* and 0.005M *dioctyl sodium sulphosuccinate* in *methanol* (*60%*) adjusted to pH 5.5 with *glacial acetic acid* and (c) a detection wavelength of 285 nm. If necessary, adjust the proportion of methanol in the mobile phase in the range 55% v/v to 65% v/v so that the retention time of morphine in solution (2) is 4 to 5 minutes. Adjust the pH of the mobile phase with either *glacial acetic acid* or 2M *sodium hydroxide* in order to obtain optimum separation of the three principal components in solution (1). The retention times of codeine and papaverine relative to that of morphine are about 1.3 and 1.7 respectively.

For morphine Calculate the content of $C_{17}H_{19}NO_3$ using the declared content of $C_{17}H_{19}NO_3$ in *morphine sulphate BPCRS*.

For papaverine Calculate the content of $C_{20}H_{21}NO_4$ using the declared content of $C_{20}H_{21}NO_4$ in *papaverine hydrochloride BPCRS*.

For codeine Calculate the content of $C_{18}H_{21}NO_3$ using the declared content of $C_{18}H_{21}NO_3$ in *codeine hydrochloride BPCRS*.

STORAGE

Papaveretum Injection should be protected from light.

LABELLING

The label states (1) the amount of Papaveretum in a suitable dose-volume; (2) the content of morphine in a suitable dose-volume.

Papaverine Injection

General Notices

Action and use

Phosphodiesterase inhibitor; smooth muscle relaxant.

DEFINITION

Papaverine Injection is a sterile solution of Papaverine Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of papaverine hydrochloride, $C_{20}H_{21}NO_4$, HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume of the injection containing 60 mg of Papaverine Hydrochloride add 2 ml of *ethanol (96%)*, evaporate to dryness on a steam bath with the aid of a stream of *nitrogen* and dry the residue at 105° for 2 hours. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of papaverine hydrochloride *(RS 415).*

B. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 2.0 to 4.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection, if necessary, with *methanol (50%)* to produce a solution containing 0.06% w/v of Papaverine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol* (50%). Solution (3) contains 0.0005% w/v of *papaverine hydrochloride BPCRS* and 0.005% w/v of *noscapine* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *endcapped octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C(18)2 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture prepared by adding 700 ml of *methanol* containing 2.22 g of *dioctyl sodium sulphosuccinate* to 100 ml of *water* containing 1.36 g of *sodium acetate*, diluting to 1 litre with *water* and adjusting the pH to 5.5 with *glacial acetic acid* and (c) a detection wavelength of 250 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to papaverine hydrochloride and noscapine is at least 3.0.

In the chromatogram obtained with solution (1), the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0045% w/v of *papaverine hydrochloride BPCRS* in *methanol (50%).* For solution (2) dilute a volume of the injection, if necessary, with *methanol* (50%) to produce a solution containing 0.0045% w/v of Papaverine Hydrochloride.

The chromatographic method described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to papaverine hydrochloride and noscapine is at least 3.0.

Calculate the content of $C_{20}H_{21}NO_4$,HCl in the injection using the declared content of $C_{20}H_{21}NO_4$,HCl in *papaverine hydrochloride BPCRS*.

STORAGE

Papaverine Injection should be protected from light.

Paracetamol Capsules

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Paracetamol Capsules contain Paracetamol.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter, evaporate the filtrate and dry at 105°.The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of paracetamol (*RS 258*).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII D, using Apparatus II. Use as the medium 900 ml of *phosphate buffer pH 5.8* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter. Dilute the filtrate with 0.1M *sodium hydroxide* to give a solution expected to contain about 0.00075% w/v of Paracetamol. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 257 nm using 0.1M *sodium hydroxide* in the reference cell. Calculate the total content of paracetamol, $C_8H_9NO_2$, in the medium taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D. Prepare the solutions immediately before use and protect from light.

(1) Disperse a quantity of the contents of the capsules containing 0.2 g of Paracetamol in 8 ml of the mobile phase with the aid of ultrasound, add sufficient mobile phase to produce 10 ml, mix well and filter.

(2) Dilute 1 volume of solution (1) to 20 volumes with the mobile phase and dilute 1 volume of the resulting solution to 20 volumes with the mobile phase.

(3) 0.002% w/v of each of *4-aminophenol* and *paracetamol BPCRS* in the mobile phase.

(4) 0.00002% w/v of *4′-chloroacetanilide* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Column temperature 35°.

(e) Detection wavelength of 245 nm.

(f) Injection volume of 20 µl for each solution.

(g) Allow the chromatography to proceed for 12 times the retention time of the principal peak.

MOBILE PHASE

A mixture of 250 volumes of *methanol* containing 1.15 g of a 40% v/v solution of *tetrabutylammonium hydroxide* with 375 volumes of 0.05M *disodium hydrogen orthophosphate* and 375 volumes of 0.05M *sodium dihydrogen orthophosphate.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminophenol is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.1%);

the area of any peak corresponding to 4′-chloroacetanilide is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (10 ppm);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Weigh the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D. Prepare the solutions immediately before use and protect from light.

(1) Disperse a quantity of the contents of the capsules containing 0.5 g of Paracetamol in 80 ml of the mobile phase with the aid of ultrasound, add sufficient mobile phase to produce 100 ml, mix well, filter and dilute 1 volume of the resulting solution to 100 volumes with the mobile phase.

(2) 0.005% w/v of *paracetamol BPCRS* in the mobile phase.

(3) 0.002% w/v each of *4-aminophenol* and *paracetamol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Sainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Column temperature 35 ^{c}.

(e) Detection wavelength of 245 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 250 volumes of *methanol* containing 1.15 g of a 40% v/v solution of *tetrabutylammonium hydroxide*, 375 volumes of 0.05M *disodium hydrogen orthophosphate* and 375 volumes of 0.05M *sodium dihydrogen orthophosphate.*

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_9NO_2$ using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS.*

STORAGE

Paracetamol Capsules should be protected from light.

Paracetamol Oral Suspension

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Paracetamol Oral Suspension is a suspension of Paracetamol in a suitable flavoured vehicle. *The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.*

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the preparation being examined with *methanol* to produce a solution containing 0.24% w/v Paracetamol and filter if necessary.

(2) 0.24% w/v of *paracetamol BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* $GF_{254.}$

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop the plate to 15 cm.

(e) Remove the plate, dry it in a current of warm air, examine under *ultraviolet light* (*254 nm*) and also reveal the spots using *Method 1.*

MOBILE PHASE

0.5 volume of glacial acetic acid, 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform.*

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to paracetamol in the chromatogram obtained with solution (1).

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake 5 ml of the preparation being examined with 15 ml of the mobile phase, dilute with the mobile phase to contain 0.48% w/v of Paracetamol and filter if necessary.

(2) 0.0024% w/v of *4-aminophenol* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil ODS is suitable).

(b) Use an isocratic system using the mobile phase described below.

(c) Use a flow rate of 2.0 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01 M *sodium butanesulphonate* in a mixture of 0.4 volumes of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water.*

LIMITS

In the chromatogram obtained with solution (1):

— the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%);

— peaks with a long retention time may occur due preservatives in the preparation.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a weighed quantity of the preparation being examined containing 24 mg of Paracetamol with 100 ml of the mobile phase, dilute to 200 ml with the mobile phase and filter if necessary.

(2) 0.012% w/v of *paracetamol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure may be carried out using the conditions described in the test for 4-Aminophenol but using a detection wavelength of 243 nm.

DETERMINATION OF CONTENT

Determine the *weight per ml* of the preparation, Appendix V G, and calculate the percentage content of $C_8H_9NO_2$, weight in volume, using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

STORAGE

Paracetamol Oral Suspension should be protected from light.

When paediatric paracetamol oral suspension or paediatric paracetamol mixture is prescribed or demanded, Paracetamol Oral Suspension containing 2.4% w/v of Paracetamol shall be dispensed or supplied.

Paracetamol Suppositories

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Paracetamol Suppositories contain Paracetamol in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* F_{254} *plate* and a mixture of 1 volume of *methanol* and 4 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add sufficient *methanol* to 1 suppository to produce a final solution containing 0.1% w/v of Paracetamol and warm on a water-bath until the suppository has melted. Allow the solution to cool, with occasional stirring, and filter. Solution (2) contains 0.1% w/v of *paracetamol BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. To a quantity of the suppositories containing 50 mg of Paracetamol cut into small pieces add 1 ml of *hydrochloric acid* and heat to boiling for 3 minutes, add 10 ml of *water* and cool. No precipitate is produced. Add 0.05 ml of *potassium dichromate solution R1*. A violet colour develops which does not change to red.

TESTS

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0005% w/v of *4-aminophenol* in the mobile phase. For solution (2) dissolve a minimum of 5 suppositories, cut into small pieces, in the minimum volume of *ethanol* (*96%*), warm if necessary, and dilute with sufficient *water* to obtain a solution containing 0.5% w/v of Paracetamol.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) 0.01M *sodium butanesulphonate* in a mixture of 0.4 volume of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 272 nm.

In the chromatogram obtained with solution (2) the area of any peak corresponding to 4-

aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (1) (0.1%).

ASSAY

For suppositories containing more than 150 mg add to 1 suppository 30 ml of *water* and 100 ml of 1M *sulphuric acid*. Boil under a reflux condenser for 1 hour, cool and add 100 ml of *water*, 50 g of frozen *water*, 50 ml of *dilute hydrochloric acid* and 0.2 ml of *ferroin solution*. Titrate with 0.2M *ammonium cerium(IV) sulphate VS* until a yellow colour is obtained. Each ml of 0.2M *ammonium cerium(IV) sulphate VS* is equivalent to 15.12 mg of $C_8H_9NO_2$. Repeat the test using a further 4 suppositories and calculate the average content per suppository from the 5 individual results thus obtained.

For suppositories containing 150 mg or less add to 1 suppository 10 ml of *water* and 30 ml of *dilute sulphuric acid*. Boil under a reflux condenser for 1 hour, cool and add 40 ml of *water*, 40 g of frozen *water*, 15 ml of *dilute hydrochloric acid* and 0.1 ml of *ferroin solution*. Titrate with 0.1M *ammonium cerium(IV) sulphate VS* until a yellow colour is obtained. Each ml of 0.1M *ammonium cerium(IV) sulphate VS* is equivalent to 7.56 mg of $C_8H_9NO_2$. Repeat the test using a further 4 suppositories and calculate the average content per suppository from the 5 individual results thus obtained.

Paracetamol Tablets

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Paracetamol Tablets contain Paracetamol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter, evaporate the filtrate to dryness and dry at 105°. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of paracetamol (*RS 258*).

B. Boil 0.1 g with 1 ml of *hydrochloric acid* for 3 minutes, add 10 ml of *water* and cool; no precipitate is produced. Add 0.05 ml of 0.0167M *potassium dichromate*; a violet colour is produced slowly which does not turn red.

C. *Melting point*, about 169°, Appendix V A.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *phosphate buffer pH 5.8* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter. Dilute the filtrate with 0.1M *sodium hydroxide* to give a solution expected to contain about 0.00075% w/v of Paracetamol. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 257 nm using 0.1M *sodium hydroxide* in the reference cell. Calculate the total content of paracetamol, $C_8H_9NO_2$, in the medium taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) disperse a quantity of powdered tablets containing 0.2 g of Paracetamol in 8 ml of the mobile phase with the aid of ultrasound, add sufficient mobile phase to produce 10 ml, mix well and filter. For solution (2) dilute 1 volume of solution (1) to 20 volumes with mobile phase and dilute 1 volume of this solution to 20 volumes with mobile phase. Solution (3) contains 0.002% w/v each of *4-aminophenol* and *paracetamol BPCRS* in the mobile phase. Solution (4) contains 0.00002% w/v of *4′-chloroacetanilide* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx C8 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute, at a temperature of 35°C, a mixture of 250 volumes of *methanol* containing 1.15 g of a 40% v/v solution of *tetrabutylammonium hydroxide* with 375 volumes of 0.05M *disodium hydrogen orthophosphate* and 375 volumes of 0.05M *sodium dihydrogen orthophosphate* and (c) a detection wavelength of 245 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

Inject solution (1) and allow the chromatography to proceed for 12 times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-aminophenol is not greater than the area of the corresponding peak in solution (3) (0.1%), the area of any peak corresponding to 4′-chloroacetanilide is not greater than the area of the principal peak in solution (4) (10 ppm) and no other impurity is greater than the area of the principal peak obtained with solution (2) (0.25%).

ASSAY

Weigh and powder 20 tablets. Add a quantity of the powder containing 0.15 g of Paracetamol to 50 ml of 0.1M *sodium hydroxide*, dilute with 100 ml of *water*, shake for 15 minutes and add sufficient *water* to produce 200 ml. Mix, filter and dilute 10 ml of the filtrate to 100 ml with *water*. Add 10 ml of the resulting solution to 10 ml of 0.1M *sodium hydroxide*, dilute to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 257 nm, Appendix II B. Calculate the content of $C_8H_9NO_2$ taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

STORAGE

Paracetamol Tablets should be protected from light.

Paracetamol, Codeine Phosphate and Caffeine Capsules

General Notices

Action and use

Analgesic; antipyretic; opioid receptor agonist.

DEFINITION

Paracetamol, Codeine Phosphate and Caffeine Capsules contain Paracetamol, Codeine Phosphate and Caffeine.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

Content of codeine phosphate, $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$

95.0 to 105.0% of the stated amount.

Content of caffeine, $C_8H_{10}N_4O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of paracetamol *(RS 258)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 24 mg of Codeine Phosphate with 30 ml of *water* for 1 minute and centrifuge. Decant, add 10 ml of 1M *sodium hydroxide* and 30 ml of *dichloromethane* to the supernatant liquid, shake for 1 minute and filter the dichloromethane layer through glass-fibre paper (Whatman GF/C is suitable).

(2) 0.08% w/v of *codeine phosphate BPCRS* in *methanol (50%)*.

(3) 0.08% w/v each of *codeine phosphate BPCRS* and *dihydrocodeine tartrate BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µl of each solution.

(d) Develop to 15 cm.

(e) After removal of the plate, dry in air, spray with *ethanolic iron(III) chloride solution* and heat at 105° for 10 minutes and examine in daylight.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 10 volumes of *methanol* and 90 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots of different colours.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

C. In the Assay for codeine phosphate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

D. Shake a quantity of the contents of the capsules containing 0.03 g of Caffeine with 10 ml of *water* for 5 minutes, filter and add 10 ml of 1M *sodium hydroxide*. Extract with three 30-ml quantities of *dichloromethane*, washing each extract with the same 10 ml of *water*. Filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness in a porcelain dish. A reddish colour is observed which changes to purple when exposed to ammonia vapour.

E. In the Assay for caffeine, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules,* Appendix XII B1, using the following conditions.

(a) Use Apparatus 2 and rotate the paddle at 50 revolutions per minute.

(b) Use 900 ml *phosphate buffer pH 5.8* as the dissolution medium at a temperature of 37°. After 45 minutes withdraw a sample of 20 ml of the medium and filter.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For paracetamol

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8,* if necessary, to contain 0.005%w/v of Paracetamol.

(2) 0.005% w/v solution of *paracetamol BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used but with a detection wavelength of 243 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_9NO_2$ in the medium using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

For codeine phosphate

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8* if necessary, to contain 0.001% w/v of Codeine Phosphate.

(2) 0.001% w/v solution of *codeine phosphate BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in the medium using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in *codeine phosphate BPCRS*.

For caffeine

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8,* if necessary, to contain 0.003% w/v of Caffeine.

(2) 0.001% w/v solution of *caffeine BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2$ in the medium using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS.*

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 0.5 g of Paracetamol with 50 ml of the mobile phase for 10 minutes and filter.

(2) 0.001% w/v of *4-aminophenol* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10µm) (Nucleosil C18 is suitable).

(b) Use an isocratic system and the mobile phase described below.

(c) Use a flow rate of 2.0 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01M *sodium butanesulphonate* in a mixture of 0.4 volumes of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water.*

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.1%);

peaks with a long retention time may occur due to excipients.

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 50 mg of Codeine Phosphate with 50 ml of 0.1M *hydrochloric acid* for 10 minutes and filter. Make the filtrate alkaline with 5M *sodium hydroxide* and extract with two 40 ml quantities of *dichloromethane*. Wash the combined extracts with 10 ml of *water*, filter through a layer of *anhydrous sodium sulphate* on an absorbent cotton plug moistened with *dichloromethane*, evaporate the filtrate to dryness at a temperature not exceeding 45° using a rotary evaporator and dissolve the residue in 2 ml of *dichloromethane.*

(2) Dilute 1.5 volumes of solution (1) to 100 volumes with *dichloromethane*.

(3) Dilute 1 volume of solution (1) to 100 volumes with *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) Use the mobile phase described below.

(c) Apply 20 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow to dry in air and spray with *potassium iodobismuthate solution*.

MOBILE PHASE

6 volumes of 13.5M *ammonia*, 30 volumes of *cyclohexane* and 72 volumes of *absolute ethanol*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%);

not more than one spot with an Rf value higher than that of the principal spot is more intense than the spot in the chromatogram obtained with solution (3) (1%).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Transfer a quantity of the contents of the capsules containing 1.0 g of Paracetamol to a

ground-glass-stoppered 15 ml centrifuge tube, add 5 ml of *peroxide-free ether*, shake mechanically for 30 minutes, centrifuge at 1000 revolutions per minute for 15 minutes or until a clear supernatant liquid is obtained and use the supernatant liquid.

(2) Dilute 1 ml of solution (1) to 10 ml with *ethanol* (*96%*).

(3) 0.0050% w/v of *4′-chloroacetanilide* in *ethanol* (*96%*).

(4) Dissolve 0.25 g of *4′-chloroacetanilide* and 0.10 g of *paracetamol BPCRS* in sufficient *ethanol* (*96%*) to produce 100 ml.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase described below.

(c) Apply 200 µl of solution (1) and 40 µl of each of solutions (2), (3) and (4).

(d) Pour the mobile phase into an unlined tank, immediately place the prepared plate in the tank, close the tank and allow the solvent front to ascend 14 cm above the line of application.

(e) After removal of the plate, dry in a current of warm air and examine under *ultraviolet light* (*254 nm*).

MOBILE PHASE

10 volumes of *toluene,* 25 volumes of *acetone* and 65 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated principal spots, the spot corresponding to 4′-chloroacetanilide having the higher Rf value.

LIMITS

Any spot corresponding to 4′-chloroacetanilide in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.005%).

Any *secondary spot* in the chromatogram obtained with solution (2) with an Rf value lower than that of 4′-chloroacetanilide is not more intense than the spot in the chromatogram obtained with solution (3) (0.25%).

Uniformity of content

Capsules containing less than 2% of Codeine Phosphate comply with the requirements stated under Capsules, with respect to the content of Codeine Phosphate, using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 100 ml of the mobile phase to the contents of one capsule and mix with the aid of ultrasound until completely dispersed. Shake for 10 minutes, dilute to 200 ml with the mobile phase, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.004% w/v of *codeine phosphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with octadecylsilyl *silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use an isocratic system using the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01M *sodium pentanesulphonate* in a mixture of 22 volumes of *methanol* and 78 volumes of *water*, the pH of the solution being adjusted to 2.8 using 2M *hydrochloric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in each capsule using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in *codeine phosphate BPCRS*.

ASSAY

For paracetamol

Mix the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 500 mg of Paracetamol with 100 ml of the mobile phase for 10 minutes, dilute to 200 ml with the same solvent, filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 5 ml of the filtrate to 250 ml with the mobile phase.

(2) 0.005% w/v of *paracetamol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used but with a detection wavelength of 243 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_9NO_2$ using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

For codeine phosphate

Mix the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 8 mg of Codeine Phosphate with 100 ml of the mobile phase for 10 minutes, dilute to 200 ml with the same solvent, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.004% w/v of *codeine phosphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$ using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$ in *codeine phosphate BPCRS*.

For caffeine

Mix the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 30 mg of Caffeine with 100 ml of the mobile phase for 10 minutes and filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 5 ml of the filtrate to 50 ml with the mobile phase.

(2) 0.003%w/v of *caffeine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2$ in each capsule using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS.*

LABELLING

The label states the quantities of Paracetamol, Codeine Phosphate and Caffeine.

Paracetamol, Codeine Phosphate and Caffeine Tablets

General Notices

Action and use

Analgesic; antipyretic; opioid receptor agonist.

DEFINITION

Paracetamol, Codeine Phosphate and Caffeine Tablets contain Codeine Phosphate, Paracetamol and Caffeine.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

Content of codeine phosphate, $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$

95.0 to 105.0% of the stated amount.

Content of caffeine, $C_8H_{10}N_4O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of paracetamol *(RS 258)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 24 mg of Codeine Phosphate with 30 ml of *water* for 1 minute and centrifuge. Decant, add 10 ml of 1M *sodium hydroxide* and 30 ml of *dichloromethane* to the supernatant liquid, shake for 1 minute and filter the dichloromethane layer through glass-fibre paper (Whatman GF/C is suitable).

(2) 0.08% w/v of *codeine phosphate BPCRS* in *methanol (50%)*.

(3) 0.08% w/v each of *codeine phosphate BPCRS* and *dihydrocodeine tartrate BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Remove the plate, dry in air, spray with *ethanolic iron(III) chloride solution* and heat at

105° for 10 minutes and examine in daylight.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 10 volumes of *methanol* and 90 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots of different colours.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

C. In the Assay for codeine phosphate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

D. Shake a quantity of the powdered tablets containing 0.5 g of Paracetamol with 10 ml of *water* for 5 minutes, filter and add 10 ml of 1M *sodium hydroxide*. Extract with three 30-ml quantities of *dichloromethane*, washing each extract with the same 10 ml of *water*. Filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate*, evaporate to dryness in a porcelain dish and expose to ammonia vapour. A pink colour is observed.

E. In the Assay for caffeine, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 50 revolutions per minute.

(b) Use p*hosphate buffer pH 5.8* as the dissolution medium.

PROCEDURE

After 45 minutes, withdraw a sample of 20 ml of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For paracetamol

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8*, if necessary, to contain 0.005% w/v of Paracetamol.

(2) 0.005% w/v solution of *paracetamol BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used but with a detection wavelength of 243 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_9NO_2$ in the medium using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

For codeine phosphate

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8*, if necessary, to contain 0.001% w/v of Codeine Phosphate.

(2) 0.001% w/v solution of *codeine phosphate BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3$,H3PO4,½H2O in the medium using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in *codeine phosphate BPCRS*.

For caffeine

(1) Use the filtered dissolution medium, diluted with *phosphate buffer pH 5.8,* if necessary, to contain 0.003% w/v of Caffeine.

(2) 0.001% w/v solution of *caffeine BPCRS* in *phosphate buffer pH 5.8*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2$ in the medium using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS.*

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.5 g of Paracetamol with 50 ml of the mobile phase for 10 minutes and filter.

(2) 0.001% w/v of *4-aminophenol* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 2.0 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Injection 20 µl for each solution.

MOBILE PHASE

0.01M *sodium butanesulphonate* in a mixture of 0.4 volumes of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water.*

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (1) (0.1%),

peaks with a long retention time may occur due to excipients.

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Codeine Phosphate with 50 ml of 0.1M *hydrochloric acid* for 10 minutes and filter. Make the filtrate alkaline with 5M *sodium hydroxide* and extract with two 40-ml quantities of *dichloromethane*. Wash the combined extracts with 10 ml of *water*, filter through a layer of *anhydrous sodium sulphate* on an absorbent cotton plug moistened with *dichloromethane*, evaporate the filtrate to dryness at a temperature not exceeding 45° using a rotary evaporator and dissolve the residue in 2 ml of *dichloromethane.*

(2) Dilute 1.5 volumes of solution (1) to 100 volumes with *dichloromethane*.

(3) Dilute 1 volume of solution (1) to 100 volumes with *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) Use the mobile phase described below.

(c) Apply 20 µl of each solution.

(d) Develop the plate to 15 cm.

(e) Remove the plate, dry in air and spray with *potassium iodobismuthate solution*.

MOBILE PHASE

6 volumes of 13.5M *ammonia*, 30 volumes of *cyclohexane* and 72 volumes of *absolute ethanol*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%),

not more than one spot with an Rf value higher than that of the principal spot is more intense than the spot in the chromatogram obtained with solution (3) (1%).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Transfer a quantity of the finely powdered tablets containing 1.0 g of Paracetamol to a ground-glass-stoppered 15 ml centrifuge tube, add 5 ml of *peroxide-free ether*, shake mechanically for 30 minutes, centrifuge at 1000 revolutions per minute for 15 minutes or

until a clear supernatant liquid is obtained and use the supernatant liquid.

(2) Dilute 1 ml of solution (1) to 10 ml with *ethanol* (*96%*).

(3) 0.0050% w/v of *4′-chloroacetanilide* in *ethanol* (*96%*).

(4) Dissolve 0.25 g of *4′-chloroacetanilide* and 0.10 g of *paracetamol* in sufficient *ethanol* (*96%*) to produce 100 ml.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase described below.

(c) Apply 200 µl of solution (1) and 40 µl of each of solutions (2), (3) and (4).

(d) Pour the mobile phase into an unlined tank, immediately place the prepared plate in the tank, close the tank.

(d) Develop the plate to 15 cm.

(d) Remove the plate, dry in a current of warm air and examine under *ultraviolet light* (*254 nm*).

MOBILE PHASE

10 volumes of *toluene,* 25 volumes of *acetone* and 65 volumes of *dichloromethane.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated principal spots, the spot corresponding to 4′-chloroacetanilide having the higher Rf value.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 4′-chloroacetanilide is not more intense than the spot in the chromatogram obtained with solution (3) (0.005%).

In the chromatogram obtained with solution (2):

any *secondary spot* with an Rf value lower than that of 4′-chloroacetanilide is not more intense than the spot in the chromatogram obtained with solution (3) (0.25%).

Uniformity of content

Tablets containing less than 2 mg or 2% of Codeine Phosphate comply with the requirements stated under Tablets, with respect to the content of Codeine Phosphate, using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 100 ml of the mobile phase to one tablet and mix with the aid of ultrasound until completely dispersed. Shake for 10 minutes, dilute to 200 ml with the mobile phase, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.004% w/v of *codeine phosphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01M *sodium pentanesulphonate* in a mixture of 22 volumes of *methanol* and 78 volumes of *water*, the pH of the solution being adjusted to 2.8 using 2M *hydrochloric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in each tablet using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,\frac{1}{2}H_2O$ in *codeine phosphate BPCRS*.

ASSAY

For paracetamol

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 500 mg of Paracetamol with 100 ml of the mobile phase for 10 minutes, dilute to 200 ml with the same solvent, filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 5 ml of the filtrate to 250 ml with the mobile phase.

(2) 0.005% w/v of *paracetamol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used but with a detection wavelength of 243 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_9NO_2$ using the declared content of $C_8H_9NO_2$ in *paracetamol BPCRS*.

For codeine phosphate

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 8 mg of Codeine Phosphate with 100 ml of the mobile phase for 10 minutes, dilute to 200 ml with the same solvent, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.004% w/v of *codeine phosphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$ using the declared content of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$ in *codeine phosphate BPCRS*.

For caffeine

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 30 mg of Caffeine with 100 ml of the mobile phase for 10 minutes, filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 5 ml of the filtrate to 50 ml with the mobile phase.

(2) 0.003% w/v of *caffeine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{10}N_4O_2$ in each tablet using the declared content of $C_8H_{10}N_4O_2$ in *caffeine BPCRS.*

LABELLING

The label states the quantities of Paracetamol, Codeine Phosphate and Caffeine.

Paraffin Ointment

General Notices

DEFINITION

White Beeswax	20 g
Hard Paraffin	30 g
Cetostearyl Alcohol	50 g
White Soft Paraffin	900 g

Extemporaneous preparation

The following directions apply.

Mix the ingredients, heat gently with stirring until homogeneous and stir until cold.
The ointment complies with the requirements stated under Topical Semi-solid Preparations.

Paraldehyde Injection

General Notices

DEFINITION

Paraldehyde Injection is Paraldehyde that has been sterilised. It does not contain any added antimicrobial preservatives.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A. A 10.0% v/v solution in *carbon dioxide-free water* (solution A) is *clear*, Appendix IV A, but becomes turbid on warming.

B. Heat 5 ml with 0.1 ml of 1M *sulphuric acid*. Acetaldehyde is evolved.

C. To 5 ml of solution A in a test tube add 5 ml of *ammoniacal silver nitrate solution* and heat on a water bath. Silver is deposited as a mirror on the side of the tube.

TESTS

Acidity

Titrate 50 ml of solution A with 0.1M *sodium hydroxide VS* using 0.05 ml of *phenolphthalein solution* as indicator. Not more than 1.5 ml of 0.1M *sodium hydroxide VS* is required to change the colour of the solution.

Distillation range

Not more than 10% distils below 123° and not less than 95% distils below 126°, Appendix V C.

Freezing point

10° to 13°, Appendix V B.

Refractive index

1.403 to 1.406, Appendix V E.

Relative density

0.991 to 0.996, Appendix V G.

Acetaldehyde

Shake 5 ml with a mixture of 5 ml of *ethanol* (*60%*), 5 ml of *alcoholic hydroxylamine solution* and 0.2 ml of *methyl orange solution*. Not more than 0.8 ml of 0.5M *sodium hydroxide VS* is required to change the colour of the solution to pure yellow.

Peroxides

To 50 ml of solution A in a ground-glass-stoppered flask add 5 ml of 1M *sulphuric acid* and 10 ml of *potassium iodide solution*, close the flask and allow to stand in the dark for 15 minutes. Titrate with 0.1M *sodium thiosulphate VS* using 1 ml of *starch solution* as indicator; allow to stand for 5 minutes and, if necessary, complete the titration. Not more than 2.0 ml of 0.1M *sodium thiosulphate VS* is required.

STORAGE

Paraldehyde Injection should be supplied in single-dose glass ampoules sealed by fusion of the glass. It should be kept in complete darkness.

LABELLING

The label states that plastic syringes should not be used for the administration of the injection.

Paroxetine Tablets

General Notices

Action and use

Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION

Paroxetine Tablets contain Paroxetine Hydrochloride Hemihydrate or Anhydrous Paroxetine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

PRODUCTION

The manufacturing process of Paroxetine Hydrochloride, used in the formulation of Paroxetine Tablets, is validated to show that the content of 4-(4-fluorophenyl)-1-methyl-1,2,3, 6-tetrahydropyridine is not more than 1 ppm.

Content of anhydrous paroxetine hydrochloride, $C_{19}H_{20}FNO_3$, HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption,* Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Dissolution test exhibits a maximum at 294 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

DISSOLUTION

Comply with the *dissolution test for tablets and capsules,* Appendix XII D, using Apparatus II. Use as the medium 900 ml of 0.1Λ *hydrochloric acid,* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of the medium and filter through a plastic filter with a GF/A filter (Millipore Swinnex is suitable). Measure the a*bsorbance* of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at 294 nm, Appendix II B, using the dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *paroxetine hydrochloride hemihydrate EPCRS* in 0.1M *hydrochloric acid* at the maximum at 294 nm using the dissolution medium in the reference cell. Calculate the total content of paroxetine hydrochloride, $C_{19}H_{20}FNO_3$,HCl, in the medium from the absorbances obtained and from the declared content of $C_{19}H_{20}FNO_3$,HCl in *paroxetine hydrochloride hemihydrate EPCRS.*

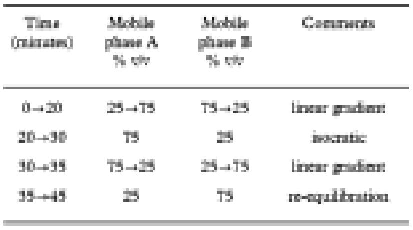
Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 50 mg of anhydrous paroxetine hydrochloride with 10 ml of *methanol* for 30 minutes. Filter through a 0.45-µm membrane filter (Gelman acrodisc GHP is suitable), dilute 1 volume of the solution with 1 volume of mobile phase B. For solution (2) dilute 1 volume of solution (1) to 100 volumes with mobile phase A and further dilute 1 volume of the resulting solution to 10 volumes with mobile phase A. Solution (3) is a 0.25% w/v solution of *paroxetine impurity standard BPCRS* in mobile phase A.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Spherisorb CN is suitable), (b) carry out a linear gradient elution using the following mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 265 nm.

Mobile phase A A mixture of 50% of *acetonitrile* and 50% of phosphate buffer pH 6.0 prepared by dissolving 4.9 g of *orthophosphoric acid* in about 800 ml of *water*, adjusting the pH to 6.0 with 1M *sodium hydroxide* and diluting to 1000 ml with *water*.

Mobile phase B Phosphate buffer pH 6.0 prepared by dissolving 4.9 g of *orthophosphoric acid* in about 800 ml, adjusting the pH to 6.0 with 1M *sodium hydroxide* and diluting to 1000 ml with *water*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comments
0→20	25→75	75→25	linear gradient
20→30	75	25	isocratic
30→35	75→25	25→75	linear gradient
35→45	25	75	re-equilibration

Inject 20 µl of solution (3). The test is not valid unless the chromatogram obtained closely resembles the chromatogram supplied with *paroxetine impurity standard BPCRS.*

Inject 20 µl each of solution (1) and solution (2). In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-(4′-fluorphenyl)-3-hydroxymethyl piperidine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%, taking into account the correction factor of 0.5) the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%) and the sum of the areas of any such peaks is not greater than five times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. For solution (1) disperse with the aid of ultrasound a quantity of powdered tablets containing the equivalent of 25 mg of anhydrous paroxetine hydrochloride in 70 ml of *water* and 5 ml of 0.05M *hydrochloric acid*. Mix with the aid of ultrasound until all the granular material has dispersed. Add 150 ml of *propan-2-ol*, shake thoroughly and mix with the aid of ultrasound with occasional swirling for 15 minutes. Cool, add sufficient *propan-2-ol* to produce 250 ml, filter through a glass microfibre filter (Whatman GF/F is suitable) and use the filtrate. Solution (2) contains 0.01% w/v of *paroxetine hydrochloride hemihydrate EPCRS* in a solution containing 1 volume 0.01M *hydrochloric acid,* 14 volumes of *water* and 35 volumes of *propan-2-ol.* Solution (3) contains 0.25% w/v of *paroxetine impurity standard BPCRS* in mobile phase A.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Spherisorb CN is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 50% of *acetonitrile* and 50% of phosphate buffer pH 6.0 prepared by dissolving 4.9 g of *orthophosphoric acid* in about 800 ml of *water*, adjusting the pH to 6.0 with 1M *sodium hydroxide* and diluting to 1000 ml with *water* and (c) a detection wavelength of 265 nm.

Inject 20 µl of solution (3). The test is not valid unless the chromatogram obtained closely resembles the chromatogram supplied with *paroxetine impurity standard BPCRS.*

Calculate the content of paroxetine hydrochloride, $C_{19}H_{20}FNO_3$,HCl, in the tablets using the declared content of $C_{19}H_{20}FNO_3$,HCl in *paroxetine hydrochloride hemihydrate EPCRS.*

LABELLING

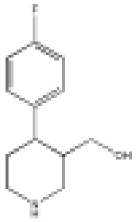
When the active ingredient is Paroxetine Hydrochloride Hemihydrate, the quantity is stated in terms of the equivalent amount of Anhydrous Paroxetine Hydrochloride.

STORAGE

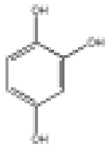
Paroxetine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirement of this monograph include:



4-(4′-fluorphenyl)-3-hydroxymethyl piperidine,



1,2,4-trihydroxybenzene.

Penicillamine Tablets

General Notices

Action and use

Disease-modifying antirheumatic drug; chelating agent; treatment of Wilson′s disease; heavy metal poisoning; cystinuria.

DEFINITION

Penicillamine Tablets contain Penicillamine. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of penicillamine, $C_5H_{11}NO_2S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 20 mg of Penicillamine with 4 ml of *water* and filter. Add to the filtrate 2 ml of *phosphotungstic acid solution* and allow to stand for a few minutes. A deep blue colour is produced.

B. Dissolve a quantity of the powdered tablets containing 10 mg of Penicillamine in 5 ml of *water* and add 0.3 ml of 5M *sodium hydroxide* and 20 mg of *ninhydrin*. An intense blue or violet-blue colour is produced immediately.

TESTS

Mercuric salts

Not more than 40 ppm, calculated with reference to the content of penicillamine, when determined by the following method. Disperse a quantity of the powdered tablets containing 1 g of Penicillamine in 10 ml of *water* in a stoppered flask, add 0.2 ml of 9M *perchloric acid* and swirl to dissolve. Add 1 ml of *ammonium pyrrolidinedithiocarbamate solution*, mix, add 2 ml of *4-methylpentan-2-one*, shake well for 1 minute and add sufficient *water* to produce 25 ml. Determine by *atomic absorption spectrophotometry*, Appendix II D, introducing the methylpentanone layer into the flame, measuring at 254 nm and using *4-methylpentan-2-one* in place of *water*. Use *mercury standard solution* (*100 ppm Hg*), suitably diluted with *water*, for the standard solutions, adjusted to contain the same concentrations of 9M perchloric acid, ammonium pyrrolidinedithiocarbamate solution and 4-methylpentan-2-one as the solution being examined.

Penicillamine disulphide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be prepared with de-gassed mobile phase and used immediately. For solution (1) shake a quantity of the powdered tablets containing 40 mg of Penicillamine with 10 ml of the mobile phase, filter and use the filtrate. Solution (2) contains 0.004% w/v of *penicillamine disulphide EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 5 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Lichrospher 5 C8 is suitable), (b) a solution containing 0.2% w/v of *methane sulphonic acid* and 0.01% w/v of *disodium edetate* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 220 nm.

In the chromatogram obtained with solution (1) the area of any peak corresponding to penicillamine disulphide is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.1 g of Penicillamine as completely as possible in 50 ml of *water* and filter. Add to the filtrate 5 ml of 1M *sodium hydroxide* and 0.2 ml of a 0.1% w/v solution of *dithizone in ethanol* (*96%*) and titrate with 0.02M *mercury*(*II*) *nitrate VS*. Each ml of 0.02M *mercury*(*II*) *nitrate VS* is equivalent to 5.968 mg of $C_5H_{11}NO_2S$.

Pentagastrin Injection

General Notices

Action and use

Gastrin analogue.

DEFINITION

Pentagastrin Injection is a sterile isotonic solution of Pentagastrin in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of pentagastrin, $C_{37}H_{49}N_7O_9S$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance on each of three plates and the following solvent systems as the mobile phases: (A) a mixture of 25 volumes of a 3% v/v solution of 13.5M *ammonia* and 75 volumes of *butan-2-ol*, (B) the upper layer produced by shaking together 10 volumes of *glacial acetic acid*, 40 volumes of *butan-1-ol* and 50 volumes of *water* and allowing to separate and (C) a mixture of 25 volumes of *water,* 25 volumes of *ether* and 50 volumes of *glacial acetic acid*. Apply separately to each plate (1) a volume of the injection containing 5 µg of Pentagastrin and (2) 1 µl of a solution of *pentagastrin BPCRS* in 0.1M *ammonia* containing 0.5% w/v of pentagastrin. After removal of the plates, allow them to dry in air, heat at 100° for 2 minutes, spray with a 1.0% w/v solution of *4-dimethylaminobenzaldehyde* in a mixture of 3 volumes of *methanol* and 1 volume of *hydrochloric acid* and heat at 100° until purple spots are produced (about 2 minutes). Examine by transmitted light. On each plate, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *water*, 20 volumes of *glacial acetic acid* and 100 volumes of *ether* as the mobile phase. Apply separately to the plate (1) four successive 5-µl quantities of the injection diluted, if necessary, with *water* to contain 0.025% w/v of Pentagastrin and (2) 5 µl of the injection diluted, if necessary, with *water* to contain 0.005% w/v of Pentagastrin. Dry the plate in a current of nitrogen after each application. After removal of the plate, allow it to dry in air, heat at 100° for 2 minutes, spray with a 1.0% w/v solution of *4-dimethylaminobenzaldehyde* in a mixture of 3 volumes of *methanol* and 1 volume of *hydrochloric acid* and heat at 100° until purple spots are produced (about 2 minutes). Examine by transmitted light. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution

(2) (5%).

Acidity or alkalinity

pH, 7.0 to 8.5, Appendix V L.

ASSAY

Dilute a volume containing 0.75 mg of Pentagastrin to 10 ml with 0.01M *ammonia* and measure the *absorbance* at the maximum at about 280 nm, Appendix II B. Calculate the content of $C_{37}H_{49}N_7O_9S$ taking 70.0 as the value of A(1%, 1 cm) at the maximum at 280 nm.

STORAGE

Pentagastrin Injection should be protected from light and stored at a temperature of 2° to 8°. It should not be allowed to freeze.

Pentamidine Injection

General Notices

Action and use

Antiprotozoal.

DEFINITION

Pentamidine Injection is a sterile solution of Pentamidine Isetionate in Water for Injections. It is prepared by dissolving Pentamidine Isetionate for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Pentamidine Injection deteriorates on storage and should be used immediately after preparation.

PENTAMIDINE ISETIONATE FOR INJECTION

DEFINITION

Pentamidine Isetionate for Injection is a sterile material consisting of Pentamidine Isetionate without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of pentamidine isetionate, $C_{19}H_{24}N_4O_2,2C_2H_6O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of pentamidine isetionate (*RS 259*).

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.002% w/v solution in 0.01M *hydrochloric acid* exhibits a maximum only at 262 nm. The *absorbance* at 262 nm is about 0.95.

C. To 10 ml of a 0.05% w/v solution add 1 ml of a 0.1% w/v solution of *glyoxal sodium bisulphite* and 1 ml of a solution prepared by dissolving 4 g of *boric acid* in a mixture of 27 ml of 1M *sodium hydroxide* and sufficient *water* to produce 100 ml. Heat on a water bath for 10 minutes. A magenta colour is produced.

TESTS

Acidity

pH of a 5% w/v solution, 4.5 to 6.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.1% w/v of the contents of the sealed container in the mobile phase. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) add to 0.1 g of the contents of the sealed container 40 ml of *water* and some glass beads, adjust the pH to 10.5 with 2M *sodium hydroxide*, heat under a reflux condenser for 20 minutes, cool and dilute to 50 ml with *water*. Dilute 1 volume of this solution to 50 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 7 volumes of a 3% w/v solution of *ammonium acetate* and 13 volumes of *methanol*, the pH of the mixture being adjusted to 7.5 with *triethylamine*, and (c) a detection wavelength of 265 nm.

For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

The test is not valid unless the chromatogram obtained with solution (3) shows two principal peaks and the *resolution factor* between these peaks is greater than 2.0.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than one fifth of the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of all such peaks is not greater than two fifths of the area of the peak in the chromatogram obtained with solution (2) (0.4%).

ASSAY

Determine the weight of the contents of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations, Powders for Injections.

Dissolve 0.25 g of the mixed contents of the 10 containers in 50 ml of *dimethylformamide* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using 0.1M *tetrabutylammonium hydroxide VS* as titrant and determining the end point potentiometrically. Each ml of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 29.63 mg of $C_{19}H_{24}N_4O_2,2C_2H_6O_4S$. Calculate the content of pentamidine isetionate, $C_{19}H_{24}N_4O_2,2C_2H_6O_4S$, in a container of average content weight.

Pentazocine Capsules

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pentazocine Capsules contain Pentazocine Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of pentazocine hydrochloride, $C_{19}H_{27}NO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 50 mg of Pentazocine Hydrochloride with 3 ml of 0.1M *sodium hydroxide* and 3 ml of *dichloromethane* and allow to separate. Filter the dichloromethane layer through a phase separation paper (Whatman 1PS is suitable) and evaporate the filtrate using a rotary evaporator at a temperature of 40°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pentazocine (form B) (*RS 261*).

B. Yields the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of *water* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtered solution, suitably diluted if necessary, at the maximum at 278 nm, Appendix II B. Calculate the total content of pentazocine hydrochloride, $C_{19}H_{27}NO,HCl$, in the medium taking 61.2 as the value of A(1%, 1 cm) at the maximum at 278 nm.

Related substances

Comply with the test described under Pentazocine Tablets, but preparing solution (1) in the following manner. For solution (1) shake a quantity of the contents of the capsules containing 0.2 g of Pentazocine Hydrochloride with 10 ml of 0.1M *methanolic ammonia*, centrifuge and use the clear supernatant liquid.

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 50 mg of Pentazocine

Hydrochloride with 200 ml of *water* for 15 minutes, add 5 ml of 1M *hydrochloric acid* and sufficient *water* to produce 500 ml, mix and filter. Measure the *absorbance* of the filtrate at the maximum at 278 nm, Appendix II B. Calculate the content of $C_{19}H_{27}NO,HCl$ taking 61.2 as the value of A(1%, 1 cm) at the maximum at 278 nm.

Pentazocine Injection

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pentazocine Injection is a sterile solution in Water for Injections of either Pentazocine Lactate or pentazocine lactate prepared by the interaction of Pentazocine and Lactic Acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of pentazocine, $C_{19}H_{27}NO$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. To a volume containing the equivalent of 90 mg of pentazocine add 5 ml of 0.1M *sodium hydroxide* and shake the resulting solution with 5 ml of *chloroform*. Wash the chloroform extract with 2 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform using a rotary evaporator and dry the oily residue at a temperature not exceeding 25° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pentazocine (form B) (*RS 261*).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 10 volumes of 18M *ammonia*, 10 volumes of *ethyl acetate*, 30 volumes of *water* and 50 volumes of *absolute ethanol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute a quantity of the injection with sufficient *methanol* to produce a solution containing the equivalent of 0.75% w/v of pentazocine. Solution (2) contains 0.4% w/v of *calcium lactate* in *methanol*. After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *potassium permanganate* and examine in daylight. The principal spot in the chromatogram obtained with solution (1) is similar in colour, position and size to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 5.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 3 volumes of *methanol*, 3 volumes of *isopropylamine* and 94 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) dilute a quantity of the injection with sufficient *ethanol* (*96%*) to produce a solution containing the equivalent of 2.0% w/v of pentazocine. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *ethanol* (*96%*). For solution (3) dilute 1 volume of solution (1) to 200 volumes with *ethanol* (*96%*). For solution (4) dilute 1 volume of solution (1) to 400 volumes with *ethanol* (*96%*). After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Heat the plate at 105 ^{c} for 15 minutes, allow to cool, expose to iodine vapour and re-examine under *ultraviolet light* (*254 nm*). By each method of visualisation any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%), not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and not more than four such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.25%). Disregard any spot remaining on the line of application.

ASSAY

To a quantity containing the equivalent of 0.15 g of pentazocine add sufficient *water* to produce 100 ml. To 5 ml add 1 ml of 1M *hydrochloric acid*, dilute to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 278.5 nm, Appendix II B. Calculate the content of $C_{19}H_{27}NO$ taking 69.0 as the value of A(1%, 1 cm) at the maximum at 278.5 nm.

STORAGE

Pentazocine Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of pentazocine in a suitable dose-volume.

Pentazocine Suppositories

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pentazocine Suppositories contain Pentazocine Lactate in a suitable suppository basis.
The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of pentazocine, $C_{19}H_{27}NO$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume of the filtrate obtained in the Assay containing the equivalent of 0.1 g of pentazocine add sufficient 1M *sodium hydroxide* to make alkaline and extract with three 10 ml quantities of *dichloromethane*. Wash the combined extracts with 5 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the dichloromethane using a rotary evaporator and dry the oily residue at a temperature not exceeding 25° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 16 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pentazocine (form B) (*RS 261*).

B. Disperse a suppository containing the equivalent of 50 mg of pentazocine in 5 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with 2 ml of 0.1M *sodium hydroxide*. Add 25 ml of *methanol* to the aqueous layer, evaporate to dryness using a rotary evaporator and dry the residue at 60° under reduced pressure for 16 hours. To the residue add 0.2 ml of *methanol* and 2 ml of *sulphuric acid* and heat the resulting solution at 85° for 2 minutes. Allow to cool and add a few mg of *4-hydroxybiphenyl*. A violet-red colour is produced within 5 minutes.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 3 volumes of *isopropylamine*, 3 volumes of *methanol* and 94 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) mix a quantity of the suppositories containing the equivalent of 0.2 g of pentazocine in 30 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with 10 ml of 0.01M *hydrochloric acid*. Add about 10 mg of *sodium carbonate* to the aqueous extract and shake to dissolve. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *chloroform*. For solution (3) dilute 5 volumes of solution (2) to 10 volumes with *chloroform*. For solution (4) dilute 5 volumes of solution (3) to 10 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under *ultraviolet light* (*254 nm*). In the chromatogram obtained with solution (1) any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%), not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and not more than four such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.25% each).

ASSAY

Dissolve a quantity of the suppositories containing the equivalent of 0.5 g of pentazocine in 50 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with six 50 ml quantities of 0.01M *hydrochloric acid*. Wash the combined extracts with two 10 ml quantities of *chloroform* and dilute to 500 ml with 0.01M *hydrochloric acid*, mix and filter (Whatman No. 1 is suitable). Dilute 10 ml of the clear filtrate to 100 ml with 0.01M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 278 nm, Appendix II B, using 0.01M *hydrochloric acid* in the reference cell. Calculate the content of $C_{19}H_{27}NO$ taking 69.0 as the value of A(1%, 1 cm) at the maximum at 278 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of pentazocine.

Pentazocine Tablets

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pentazocine Tablets contain Pentazocine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pentazocine hydrochloride, $C_{19}H_{27}NO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.1 g of Pentazocine Hydrochloride with 10 ml of *water,* filter (Whatman GF/C is suitable), add 1 ml of 1M *sodium hydroxide* and shake the resulting solution with 20 ml of *chloroform*. Wash the chloroform extract with 5 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform using a rotary evaporator and dry the oily residue at 60° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the powdered residue, Appendix II A, is concordant with the *reference spectrum* of pentazocine (form B) (*RS 261*). If the spectra are not concordant, dissolve the residue in *chloroform*, evaporate to dryness and prepare a new spectrum of the residue.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 94 volumes of *chloroform*, 3 volumes of *methanol* and 3 volumes of *isopropylamine* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.2 g of Pentazocine Hydrochloride with 10 ml of 0.1M *methanolic ammonia* for 10 minutes, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the same solvent. For solution (3) dilute 1 volume of solution (1) to 200 volumes with the same solvent. For solution (4) dilute 1 volume of solution (1) to 400 volumes with the same solvent. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under *ultraviolet light* (*254 nm*). By each method of visualisation any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2), not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) and not more than four such spots are more intense than the spot in the chromatogram obtained with solution (4). Disregard any spot remaining on the line of application.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 25 mg of Pentazocine Hydrochloride with 100 ml of *water* for 15 minutes, add 2.5 ml of 1M *hydrochloric acid* and sufficient *water* to produce 250 ml and filter. Measure the *absorbance* of the filtrate at the maximum at 278 nm, Appendix II B. Calculate the content of $C_{19}H_{27}NO,HCl$ taking 61.2 as the value of A(1%, 1 cm) at the maximum at 278 nm.

Pentobarbital Tablets

General Notices

Action and use

Barbiturate.

DEFINITION

Pentobarbital Tablets contain Pentobarbital Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pentobarbital sodium, $C_{11}H_{17}N_2NaO_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Heat 0.2 g of the residue obtained in the Assay on a water bath with the minimum quantity of *ethanol* (*25%*) until dissolved, filter while hot and allow the filtrate to cool. Filter, wash the crystals with a small quantity of *ethanol* (*25%*) and dry at 105°. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of pentobarbital (*RS 264*).

B. The powdered tablets yield the reactions characteristic of *sodium salts*, Appendix VI.

TESTS

Isomer

Dissolve a quantity of the powdered tablets containing 0.3 g of Pentobarbital Sodium in 5 ml of a 5% w/v solution of *anhydrous sodium carbonate*, heating gently if necessary. Add 10 ml of a 3% w/v solution of *4-nitrobenzyl chloride* in *ethanol* (*96%*) and heat under a reflux condenser for 30 minutes. Cool to 25°, filter and wash the precipitate with five 5 ml quantities of *water*. Heat the precipitate with 25 ml of *ethanol* (*96%*) in a small flask under a reflux condenser until dissolved (about 10 minutes). Filter the hot solution, cool to 25° and, if necessary, scratch the side of the flask with a glass rod to induce crystallisation. Filter, wash the precipitate with two 5 ml quantities of *water* and dry at 100° to 105° for 30 minutes. The *melting point* of the dried precipitate is 136° to 148°, Appendix V A, Method I.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.3 g of Pentobarbital Sodium as completely as possible in 10 ml of a 2% w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive 15 ml quantities of *ether* until complete extraction is effected. Wash the combined extracts with two 2 ml quantities of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue to constant weight at 105°. Each g of residue is equivalent to

1.097 g of $C_{11}H_{17}N_2NaO_3$.

Peppermint Spirit

General Notices

Peppermint Essence

DEFINITION

Peppermint Oil	100 ml
Ethanol (90 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Dissolve the Peppermint Oil in Ethanol (90 per cent) and add sufficient Ethanol (90 per cent) to produce 1000 ml. If the solution is not clear, shake with previously sterilised Purified Talc and filter.

The spirit complies with the requirements stated under Spirits and with the following requirements.

TESTS

Ethanol content

78 to 82% v/v, Appendix VIII F.

Weight per ml

0.830 to 0.840 g, Appendix V G.

Content of oil

9.0 to 11.0% v/v when determined by the following method. Add 25 ml of the spirit and 5 ml of *xylene* to 90 ml of a 10% w/v solution of *sodium chloride* containing 1.0% v/v of *hydrochloric acid* in a flask of about 150 ml capacity with a long neck graduated in 0.1 ml increments and of such a diameter that a 15-cm length has a capacity of 10 ml. Shake the mixture for about 30 minutes, allow to separate and raise the undissolved oily layer into the graduated part of the neck of the flask by the gradual addition of more of the acidified sodium chloride solution, allow to stand for 2 hours or until there is no further change in volume of the oily layer and measure the volume of the oily layer. The volume of the oily layer, after the subtraction of 5 ml, is taken to be the volume of oil.

Peritoneal Dialysis Solutions

General Notices

(Ph Eur monograph 0862)

Ph Eur

DEFINITION

Solutions for peritoneal dialysis are preparations for intraperitoneal use containing electrolytes with a concentration close to the electrolytic composition of plasma. They contain glucose in varying concentrations or other suitable osmotic agents.

Solutions for peritoneal dialysis are supplied in:

— rigid or semi-rigid plastic containers,

— flexible plastic containers fitted with a special connecting device; these are generally filled to a volume below their nominal capacity and presented in closed protective envelopes,

— glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral use *(3.2.1 and 3.2.2)*.

Several formulations are used. The concentrations of the components per litre of solution are usually in the following range:

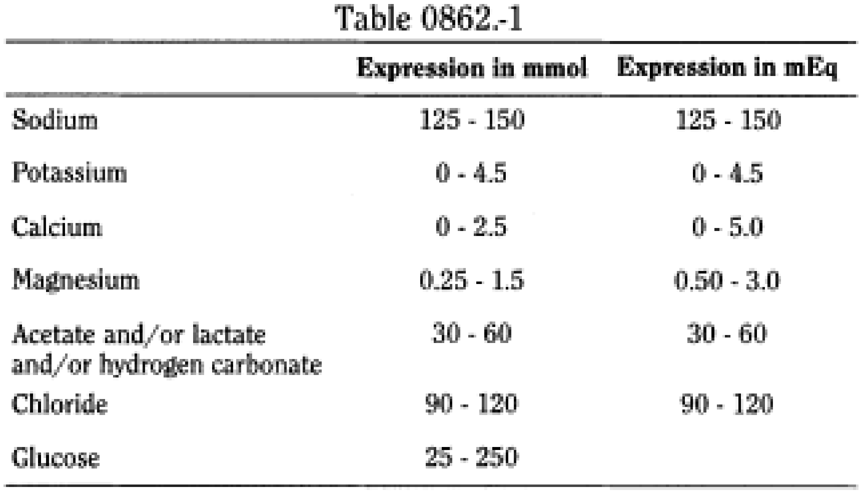


Table 0862.-1

	Expression in mmol	Expression in mEq
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	0 - 2.5	0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	25 - 250	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

Unless otherwise justified and authorised, antioxidants such as metabisulphite salts are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

— potassium: reaction (b);

— calcium: reaction (a);

— sodium: reaction (b);

— chlorides: reaction (a);

— acetates: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;

— lactates, hydrogen carbonates; the identification is carried out together with the assay;

— magnesium: to 0.1 ml of *titan yellow solution R* add 10 ml of *water R*, 2 ml of the solution to be examined and 1 ml of *1 M sodium hydroxide*; a pink colour is produced;

— glucose: to 5 ml of the solution to be examined, add 2 ml of *dilute sodium hydroxide solution R* and 0.05 ml of *copper sulphate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution

The solution is clear *(2.2.1)* and not more intensely coloured than reference solution Y_4 *(2.2.2, Method I)*.

pH *(2.2.3)*

The pH of the solution is 5.0 to 6.5. If the solution contains hydrogen carbonate, the pH is 6.5 to 8.0.

Hydroxymethylfurfural

To a volume of the solution containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance *(2.2.25)* determined at 550 nm after allowing the mixture to stand for 2 min to 3 min is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined. If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R*.

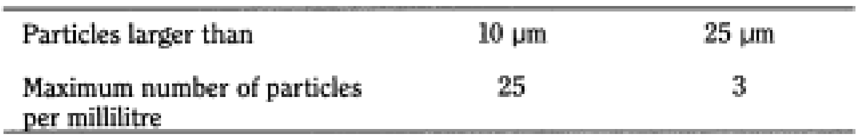
Aluminium *(2.4.17)*

Take 400 ml, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (15 µg/l). Use as the reference solution a mixture of 3 ml of *aluminium standard solution (2 ppm Al) R,* 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R.* To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Particulate contamination

Carry out the test for sub-visible particles (*2.9.19*) using 50 ml of solution.

Table 0862.-2



Particles larger than	10 µm	25 µm
Maximum number of particles per millilitre	25	3

Extractable Volume *(2.9.17)*

The solution complies with the test prescribed for parenteral infusions.

Sterility *(2.6.1)*

The solution complies with the test for sterility.

Bacterial endotoxins *(2.6.14)*

Less than 0.25 IU/ml.

Pyrogens *(2.6.8)*

Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution.

ASSAY

Sodium

97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method II)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Measure the absorbance at 589.0 nm using a sodium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Potassium

95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 ml of the solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Measure the absorbance at 766.5 nm, using a potassium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Calcium

95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Magnesium

95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label, determined by atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

Measure the absorbance at 285.2 nm using a magnesium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Total chloride

95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label. Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate

95.0 per cent to 105.0 per cent of the content of acetate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration *(2.2.20)*, using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate

95.0 per cent to 105.0 per cent of the content of lactate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of *0.1 M hydrochloric acid*. Then add 50 ml of *acetonitrile R*. Carry out a potentiometric titration *(2.2.20)*, using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml *of 0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label. Titrate with *0.1 M hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically *(2.2.20)*.

1 ml *of 0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Lactate and hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of lactates and/or hydrogen carbonates stated on the label. Examine by liquid chromatography *(2.2.29)*.

Test solution Solution to be examined.

Reference solution Dissolve in 100 ml of *water for chromatography R* quantities of lactates and hydrogen carbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations indicated on the label.

The chromatographic procedure may be carried out using:

— a column 0.30 m long and 7.8 mm in internal diameter packed with *cation exchange resin R* (9 µm),

— as mobile phase at a flow rate of 0.6 ml/min *0.005 M sulphuric acid* previously degassed with *helium R*,

— a differential refractometer detector,

maintaining the temperature of the column at 85 °C.

Inject in duplicate 20 µl of test solution and 20 µl of each reference solution. When the chromatograms are recorded in the prescribed conditions, the peaks elute in the following order: lactates then hydrogen carbonates.

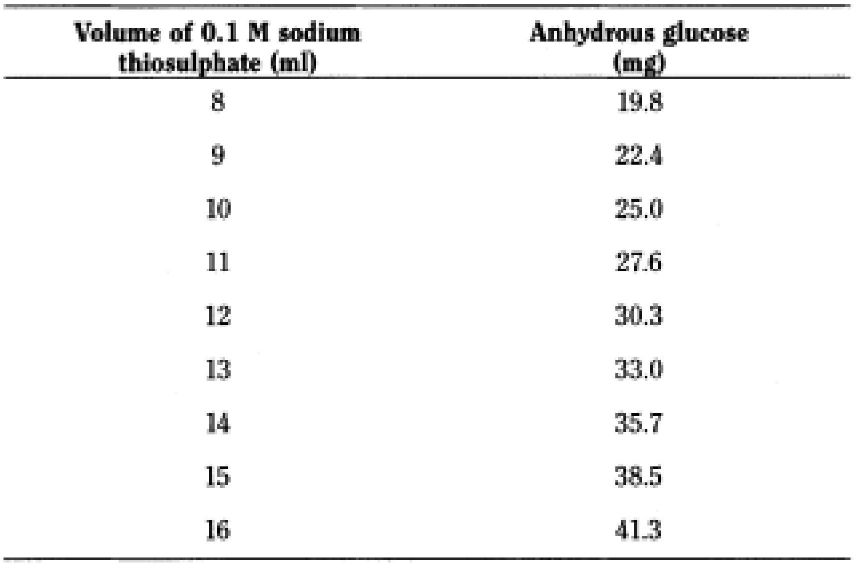
Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

Reducing sugars (expressed as anhydrous glucose)

95.0 per cent to 105.0 per cent of the content of glucose stated on the label. Transfer a volume of solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R.* Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 ml of *water R.*

Calculate the content of reducing sugars expressed as anhydrous glucose ($C_6H_{12}O_6$), by means of Table 0862.-3:

Table 0862.-3



Volume of 0.1 M sodium thiosulphate (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not below 4 °C.

LABELLING

The label states:

- the formula of the solution for peritoneal dialysis, expressed in grams per litre and in millimoles per litre,
- the calculated osmolarity, expressed in milliosmoles per litre,
- the nominal volume of the solution for peritoneal dialysis in the container,
- that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic,
- the storage conditions,
- that the solution is not to be used for intravenous infusion,
- that any unused portion of solution is to be discarded.

Ph Eur

Perphenazine Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Perphenazine Tablets contain Perphenazine. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of perphenazine, $C_{21}H_{26}ClN_3OS$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 40 mg of Perphenazine add 10 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether layer with 5 ml of *water*, dry with *anhydrous sodium sulphate* and evaporate the ether to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of perphenazine (*RS 265*).

B. Extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of *methanol*, pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol* at 50°, cool and allow to stand for 4 hours. The *melting point* of the precipitate, after recrystallisation from *methanol*, is about 248°, with decomposition, Appendix V A.

C. To a quantity of the powdered tablets containing 5 mg of Perphenazine add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

TESTS

Related substances

Comply with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase C* and applying separately to the plate 50 µl of each of the following freshly prepared solutions. For solution (1) extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *ethanol* (*96%*) and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *ethanol* (*96%*).

Uniformity of content

Tablets containing 2 mg or less of Perphenazine comply with the requirements stated under Tablets using the following method of analysis. Carry out the following procedure protected from light. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 210 to 290 nm. For solution (1) add 5 ml of *water* to one tablet, mix with the aid of ultrasound for 15 minutes or until the tablet has completely disintegrated, heat on a water bath for 3 minutes, swirling continuously and cool. Add 50 ml of *ethanol* (*96%*), mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 100 ml with *ethanol* (*96%*) and filter through a glass microfibre filter paper. Dilute the filtrate, if necessary, with *ethanol* (*96%*) to produce a solution containing 0.001% w/v of Perphenazine. Solution (2) contains 0.001% w/v of *perphenazine BPCRS* in *ethanol* (*96%*).

For each solution measure the amplitude from the peak at 265 nm to the trough at 255 nm. Calculate the content of $C_{21}H_{26}N_3OS$ in each tablet using the declared content of $C_{21}H_{26}N_3OS$ in *perphenazine BPCRS*.

ASSAY

For tablets containing more than 2 mg of Perphenazine

Carry out the following procedure protected from light. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 210 to 290 nm. For solution (1) add 50 ml of *water* to 10 tablets, mix with the aid of ultrasound for 15 minutes or until the tablets have completely disintegrated, heat on a water bath for 3 minutes, swirling continuously, cool, add 400 ml of *ethanol* (*96%*), mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 500 ml with *ethanol* (*96%*) and filter through a glass microfibre filter paper. Dilute the filtrate with *ethanol* (*96%*) to produce a solution containing 0.001% w/v of Perphenazine. Solution (2) contains 0.001% w/v of *perphenazine BPCRS* in *ethanol* (*96%*). Measure the amplitude from the peak at 265 nm to the trough at 255 nm. Calculate the content of $C_{21}H_{26}N_3OS$ using the declared content of $C_{21}H_{26}N_3OS$ in *perphenazine BPCRS*.

For tablets containing 2 mg or less of Perphenazine

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Pethidine Injection

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pethidine Injection is a sterile solution of Pethidine Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

PRODUCTION

The manufacturing process of Pethidine Hydrochloride, used in the formulation of Pethidine Injection, is validated to show that the content of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine is not more than 0.1 ppm.

Content of pethidine hydrochloride, $C_{15}H_{21}NO_2$,HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 50 mg of Pethidine Hydrochloride add sufficient 1M *sodium hydroxide* to make strongly alkaline to *litmus paper* and extract with two 10 ml quantities of *chloroform*. Wash the combined extracts with 5 ml of *water*, dry over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Remove the last traces of chloroform by drying the residual oil at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of pethidine (*RS 266*).

B. Yields the reactions characteristic of *chlorides*, Appendix VI.

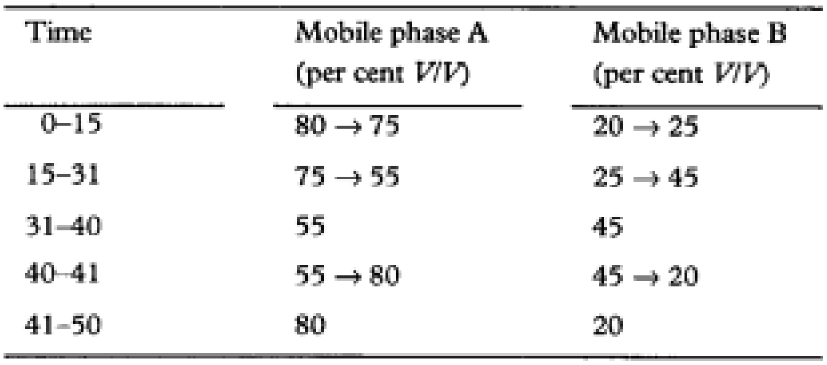
Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection containing 0.1 g of Pethidine Hydrochloride to 25 ml with a mixture of 20 volumes of *acetonitrile* and 80 volumes of *water*. For solution (2) dilute 0.5 volume of solution (1) to 100 volumes with a mixture of 20 volumes of *acetonitrile* and 80 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.0 mm) packed with *spherical end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 340 m^2/g, a pore size of 10 nm and a carbon loading of 19% (Kromasil C18 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute the gradient elution programme described below and (c) a detection wavelength of 210 nm.

Mobile phase A Mix equal volumes of a 4.2% w/v solution of *sodium perchlorate* and a 1.2% w/v solution of *orthophosphoric acid*. Adjust the pH to 2.0 with *triethylamine*.

Mobile phase B Acetonitrile.



Time	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0–15	80 → 75	20 → 25
15–31	75 → 55	25 → 45
31–40	55	45
40–41	55 → 80	45 → 20
41–50	80	20

Inject 20 µl of each of solutions (1) and (2).

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%). Disregard any peak with an area 0.1 times the area of the peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, with sufficient *water* to produce a solution containing 0.1% w/v of Pethidine Hydrochloride and further dilute 3 volumes of the resulting solution to 25 volumes with the mobile phase. For solution (2) dilute 3 volumes of a 0.10% w/v solution of *pethidine hydrochloride BPCRS* mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable) maintained at 40^{c}, (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 11 volumes of *acetonitrile* and 9 volumes of a mixture prepared in the following manner: dissolve 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 10 ml *triethylamine*, mix well and adjust the solution to pH 7.0 with *orthophosphoric acid* and (c) a detection wavelength of 230 nm.

The *column efficiency*, determined on the peak due to pethidine in the chromatogram obtained with solution (2), should be at least 8000 *theoretical plates* per metre.

Calculate the content of $C_{15}H_{21}NO_2$,HCl in the injection using the declared content of $C_{15}H_{21}NO_2$,HCl in *pethidine hydrochloride BPCRS*.

Pethidine Tablets

General Notices

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Pethidine Tablets contain Pethidine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pethidine hydrochloride, $C_{15}H_{21}NO_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Pethidine Hydrochloride with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and dry the residue at a pressure of 2 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pethidine hydrochloride (*RS 267*).

B. Shake a quantity of the powdered tablets containing 0.2 g of Pethidine Hydrochloride with 20 ml of *water* and filter. To 5 ml of the filtrate add 10 ml of *picric acid solution R1*. The *melting point* of the crystals so obtained, after washing with *water*, is about 190°, Appendix V A.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *kieselguhr G* as the coating substance but allowing the solvent front to ascend 12 cm above the line of application. Impregnate the dry plate by placing it in a closed tank containing a mixture of 10 volumes of *2-phenoxyethanol* and 90 volumes of *acetone* so that the plate dips about 5 mm beneath the surface of the liquid, allowing the impregnation solvent to ascend at least 15 cm, removing the plate from the tank and drying in a current of air. Use immediately, with the flow of the mobile phase in the same direction as the impregnation. Use as the mobile phase the upper layer obtained by shaking together 1 volume of *diethylamine*, 8 volumes of *2-phenoxyethanol* and 100 volumes of *petroleum spirit* (*boiling range, 50° to 70°*) and allowing it to settle.

Apply separately to the plate 5 µl of each of the following solutions. For solution (1) use the upper layer obtained by shaking a quantity of the powdered tablets containing 0.1 g of Pethidine Hydrochloride with 5 ml of *water*, filtering, shaking the filtrate with 0.5 ml of 5M *sodium hydroxide* and 2 ml of *ether* and allowing the layers to separate. For solution (2) dilute 0.5 ml of solution (1) to 50 ml with *ether*.

After removal of the plate, allow it to dry in air for 10 minutes, return the plate to the tank and repeat the development. Remove the plate, allow it to dry in air for 10 minutes and spray with a 0.2% w/v solution of *2,7-dichlorofluorescein* in *methanol*. Allow the plate to stand for 5 minutes and spray with *water* until the background is white to pale yellow. Examine in daylight. The chromatograms show red or orange spots. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%). Examine without delay under *ultraviolet light* (*365 nm*). The chromatograms show spots with intense yellow fluorescence. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Pethidine Hydrochloride in 40 ml of *water*, add 2 ml of 5M *sodium hydroxide* and extract immediately with quantities of 25, 10 and 10 ml of *chloroform*. Wash each extract with the same 15 ml of *water* and filter into a dry flask. Titrate the combined extracts, which should be clear and free from droplets of *water*, with 0.05M *perchloric acid VS* using 0.15 ml of *1-naphtholbenzein solution* as indicator. Each ml of 0.05M *perchloric acid VS* is equivalent to 14.19 mg of $C_{15}H_{21}NO_2$,HCl.

Phenelzine Tablets

General Notices

Action and use

Monoamine oxidase inhibitor; antidepressant.

DEFINITION

Phenelzine Tablets contain Phenelzine Sulphate. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenelzine, $C_8H_{12}N_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 30 mg of phenelzine with 25 ml of *water* for 5 minutes and filter. Make the filtrate alkaline with 5M *sodium hydroxide* and extract with two 25 ml quantities of *chloroform*. Extract the combined chloroform layers with two 25 ml quantities of 0.05M *sulphuric acid* and dilute the combined extracts to 100 ml with 0.05M *sulphuric acid*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits three well-defined maxima, at 252, 258 and 263 nm.

B. Extract a quantity of the powdered tablets containing the equivalent of 30 mg of phenelzine with 10 ml of *water* and filter. Make 5 ml of the filtrate alkaline with 5M *sodium hydroxide* and add 1 ml of *cupri-tartaric solution R1*. A red precipitate is produced.

C. Extract a quantity of the powdered tablets containing the equivalent of 45 mg of phenelzine with 5 ml of *water* and filter. The filtrate yields the reactions characteristic of *sulphates*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 0.1 g of phenelzine add 20 ml of *water* and 2 ml of 2M *hydrochloric acid*, heat to boiling and boil for 30 seconds, stirring constantly. Add 25 ml of *water*, cool, add 2 g of *sodium hydrogen carbonate* and 50 ml of 0.05M *iodine VS*, stopper the flask and allow to stand for 90 minutes. Add 15 ml of 2M *hydrochloric acid* and titrate with 0.1M *sodium thiosulphate VS* using *starch mucilage*, added towards the end of the titration, as indicator. Repeat the operation without the powder. The difference between the titrations represents the amount of iodine required. Each ml of 0.05M *iodine VS* is equivalent to 3.405 mg of $C_8H_{12}N_2$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of phenelzine.

Phenindione Tablets

General Notices

Action and use

Oral anticoagulant (indanedione).

DEFINITION

Phenindione Tablets contain Phenindione.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenindione, $C_{15}H_{10}O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.2 g of Phenindione with 50 ml of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of phenindione (*RS 268*).

B. Recrystallise the residue obtained in test A from *ethanol* (*96%*), dissolve 20 mg in 10 ml of *ethanol* (*96%*) with the aid of heat, cool, dilute to 250 ml with 0.1M *sodium hydroxide* and dilute 5 ml to 100 ml with 0.1M *sodium hydroxide*. The *absorbance* of the resulting solution at the maximum at 278 nm is about 0.54 and at 330 nm is about 0.16, Appendix II B.

TESTS

Related substances

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and as the mobile phase a solution containing 0.02% w/v of *butylated hydroxytoluene* in a mixture of 4 volumes of *glacial acetic acid*, 20 volumes of *ethyl acetate* and 80 volumes of *toluene*. Allow the solvent front to ascend 4 cm, remove the plate and dry it in a current of cold air for 1 minute. Without delay apply separately to the plate 10 µl of each of the following solutions and develop immediately. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Phenindione with 15 ml of *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of *dichloromethane*. For solution (2) dilute 1 volume of solution (1) to 50 volumes with *dichloromethane*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *dichloromethane*. After removal of the plate, allow it to dry in a current of warm air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (2%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Uniformity of content

Tablets containing 50 mg or less of Phenindione comply with the requirements stated under Tablets using the following method of analysis. Place one tablet in 50 ml of 0.1M *sodium hydroxide*, dissolve the tablet completely by shaking gently, add a further 100 ml of 0.1M *sodium hydroxide* and shake for 1 hour. Dilute to 250 ml with 0.1M *sodium hydroxide*, filter and dilute a portion of the filtrate with sufficient 0.1M *sodium hydroxide* to produce a solution containing 4 µg of Phenindione per ml. Measure the *absorbance* of the resulting solution at the maximum at 278 nm, Appendix II B. Calculate the content of $C_{15}H_{10}O_2$ taking 1310 as the value of A(1%, 1 cm) at the maximum at 278 nm.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 50 mg of Phenindione with 150 ml of 0.1M *sodium hydroxide* for 1 hour, add sufficient 0.1M *sodium hydroxide* to produce 250 ml, filter and dilute 5 ml of the filtrate to 250 ml with 0.1M *sodium hydroxide*. Measure the *absorbance* of the resulting solution at the maximum at 278 nm, Appendix II B. Calculate the content of $C_{15}H_{10}O_2$ taking 1310 as the value of A(1%, 1 cm) at the maximum at 278 nm.

Phenobarbital Elixir

General Notices

Phenobarbital Oral Solution

Action and use

Barbiturate.

DEFINITION

Phenobarbital Elixir is an *oral solution* containing 0.3% w/v of Phenobarbital in a suitable flavoured vehicle containing a sufficient volume of Ethanol (96 per cent) or of an appropriate Dilute Ethanol to give a final concentration of 38% v/v of ethanol.

The elixir complies with the requirements stated under Oral Liquids and with the following requirements.

Content of phenobarbital, $C_{12}H_{12}N_2O_3$

0.27 to 0.33% w/v.

IDENTIFICATION

The residue obtained in the Assay complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of phenobarbital (*RS 270*).

B. *Melting point,* about 175°, Appendix V A.

TESTS

Ethanol content

36 to 40% v/v, Appendix VIII F.

ASSAY

Extract 50 ml with three 50 ml quantities of *ether*, wash the combined ether extracts with 20 ml of *water*, discard the washings, extract the ether solution with a mixture of 5 ml of 2M *sodium hydroxide* and 25 ml of *water* and then with two 5 ml quantities of *water*. Acidify the combined aqueous extracts to *litmus paper* with 2M *hydrochloric acid*, extract with four 25 ml quantities of *ether*, wash the combined ether extracts with two 2 ml quantities of *water*, wash the combined aqueous washings with 10 ml of *ether*, add the ether washings to the combined ether extracts, evaporate the ether and dry the residue of phenobarbital to constant weight at 105°. Calculate the content of $C_{12}H_{12}N_2O_3$ in the elixir as a % w/v.

STORAGE

Phenobarbital Elixir should be protected from light.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Phenobarbital Injection

General Notices

Action and use

Barbiturate.

DEFINITION

Phenobarbital Injection is a sterile solution containing 20% w/v of Phenobarbital Sodium in a mixture of nine volumes of Propylene Glycol and one volume of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenobarbital sodium, $C_{12}H_{11}N_2NaO_3$

19.0 to 21.0% w/v.

IDENTIFICATION

To 5 ml add 15 ml of *water*, make slightly acidic with 1M *sulphuric acid* and filter. The residue, after washing with *water* and drying at 105°, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the reference spectrum of phenobarbital (*RS 270*).

B. *Melting point*, about 175°, Appendix V A.

C. Dissolve 50 mg in 2 ml of a 0.2% w/v solution of *cobalt*(*II*) *acetate* in *methanol*, warm, add 50 mg of powdered *sodium tetraborate* and heat to boiling. A bluish violet colour is produced.

TESTS

Alkalinity

pH, 10.0 to 11.0, Appendix V L.

Weight per ml

1.090 to 1.100 g, Appendix V G.

ASSAY

To 2 g add 30 ml of *water* and 3 g of *sodium carbonate*, stir to dissolve and titrate with 0.1M *silver nitrate VS* until a distinct turbidity is observed when viewed against a black background, the solution being stirred vigorously throughout the titration. Each ml of 0.1M *silver nitrate VS* is equivalent to 25.42 mg of $C_{12}H_{11}N_2NaO_3$. Use the *weight per ml* of the injection to calculate the percentage w/v of phenobarbital sodium, $C_{12}H_{11}N_2NaO_3$.

Phenobarbital Sodium Tablets

General Notices

Action and use

Barbiturate.

DEFINITION

Phenobarbital Sodium Tablets contain Phenobarbital Sodium.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenobarbital sodium, $C_{12}H_{11}N_2NaO_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Heat 0.2 g of the residue obtained in the Assay on a water bath with 15 ml of *ethanol* (*25%*) until dissolved, filter while hot and allow to cool. Filter through a sintered-glass crucible, wash with a small quantity of *ethanol* (*25%*) and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of phenobarbital (*RS 270*).

B. The powdered tablets yield the reactions characteristic of *sodium salts*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powdered tablets containing 0.3 g of Phenobarbital Sodium as completely as possible in 10 ml of a 2% w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive 15 ml quantities of *ether* until complete extraction is effected. Wash the combined extracts with two 2 ml quantities of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue of phenobarbital to constant weight at 105°. Each g of residue is equivalent to 1.095 g of $C_{12}H_{11}N_2NaO_3$. Calculate the quantity of $C_{12}H_{11}N_2NaO_3$ in the tablets as a percentage of the stated amount.

Phenobarbital Tablets

General Notices

Action and use

Barbiturate.

DEFINITION

Phenobarbital Tablets contain Phenobarbital.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenobarbital, $C_{12}H_{12}N_2O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Heat 0.2 g of the residue obtained in the Assay on a water bath with 15 ml of *ethanol (25%)* until dissolved, filter while hot and allow the filtrate to cool. Filter, wash the crystals with a small quantity of *ethanol (25%)* and dry at 105°. The residue complies with the following tests.

A. *Melting point*, about 175°, Appendix V A.

B. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of phenobarbital (*RS 270*). If the spectra obtained are not concordant, heat the residue in a sealed tube at 105° for 1 hour and prepare a new spectrum of the residue.

C. Dissolve 50 mg in 2 ml of a 0.2% w/v solution of *cobalt(II) acetate* in *methanol*, warm, add 50 mg of powdered *sodium tetraborate* and heat to boiling. A bluish violet colour is produced.

TESTS

Disintegration

Maximum time, 30 minutes, Appendix XII A1.

ASSAY

Weigh and powder 20 tablets. Extract a quantity of the powder containing 0.3 g of Phenobarbital in a continuous extraction apparatus with *ether* until complete extraction is effected. Remove the ether and dry the residue of phenobarbital to constant weight at 105°. Calculate the content of $C_{12}H_{12}N_2O_3$ in the tablets as a percentage of the stated amount.

Phenol and Glycerol Injection

General Notices

DEFINITION

Phenol and Glycerol Injection is a sterile solution containing 5% w/v of Phenol in Glycerol that has been previously dried at 120° for 1 hour.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenol, C_6H_6O

4.75 to 5.25% w/v.

CHARACTERISTICS

A pale straw-coloured, viscous solution.

IDENTIFICATION

A. Add *bromine water* to a 1% w/v solution. A white precipitate is produced, which, on the continued addition of *bromine water*, at first dissolves then reappears and becomes permanent.

B. To 0.5 ml add 5 ml of *water* and 0.05 ml of *sodium nitrite solution* and carefully pour on to the surface of *sulphuric acid*. A coloured zone, red above and green below, appears at the junction of the two layers.

C. When heated on a borax bead in a naked flame, it imparts a green colour to the flame.

ASSAY

Dissolve 2 g in sufficient *water* to produce 50 ml, transfer 25 ml to a 500 ml glass-stoppered flask and add 50 ml of 0.05M *bromine VS* and 5 ml of *hydrochloric acid*, stopper, swirl occasionally during 30 minutes and allow to stand for a further 15 minutes. Add 5 ml of a 20% w/v solution of *potassium iodide*, taking care to avoid loss of bromine, shake thoroughly and titrate with 0.1M *sodium thiosulphate VS* until only a faint yellow colour remains. Add 0.1 ml of *starch mucilage* and 10 ml of *chloroform* and complete the titration with vigorous shaking. Repeat the operation without the injection. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O. Determine the *weight per ml* of the injection, Appendix V G, and calculate the percentage w/v of C_6H_6O.

STORAGE

Phenol and Glycerol Injection should be protected from light.

LABELLING

The strength is stated as the percentage w/v of Phenol.

Phenoxybenzamine Capsules

General Notices

Action and use

Alpha-adrenoceptor antagonist.

DEFINITION

Phenoxybenzamine Capsules contain Phenoxybenzamine Hydrochloride.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of phenoxybenzamine hydrochloride, $C_{18}H_{22}ClNO,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the contents of the capsules containing 40 mg of Phenoxybenzamine Hydrochloride in 50 ml of *ethanol-free chloroform*, wash the solution with three 20 ml quantities of 0.01M *hydrochloric acid*, filter the chloroform solution and dilute 10 ml of the filtrate to 50 ml with *ethanol-free chloroform*. The *light absorption* of the resulting solution, Appendix II B, exhibits two maxima, at 272 nm and 279 nm.

B. The contents of the capsules yield reaction A characteristic of *chlorides*, Appendix VI.

ASSAY

Weigh 20 capsules. Open the capsules carefully without loss of shell material, remove the contents, wash the shells with three 10 ml quantities of *chloroform* and add the washings to the capsule contents. Allow the shells to dry at room temperature to constant weight. The difference between the weights represents the weight of the total contents. Evaporate the mixed capsule contents and washings to dryness, stirring continuously, and carry out Method I for *non-aqueous titration*, Appendix VIII A, adding 10 ml of *mercury(II) acetate solution* and using *oracet blue B solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 34.03 mg of $C_{18}H_{22}ClNO,HCl$.

Phenoxymethylpenicillin Oral Solution

General Notices

Action and use

Penicillin antibacterial.

DEFINITION

Phenoxymethylpenicillin Oral Solution is a solution of Phenoxymethylpenicillin Potassium in a suitable flavoured vehicle. It is prepared by dissolving the dry ingredients in the specified volume of Water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Suspensions stated under Oral Liquids.

For the following tests prepare the Oral Solution as directed on the label. The solution, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of phenoxymethylpenicillin, $C_{16}H_{18}N_20_5S$, calculated as the sum of the contents of phenoxymethylpenicillin and 4-hydroxyphenoxymethylpenicillin

When freshly constituted, not more than 120.0% of the stated amount of phenoxymethylpenicillin. When stored at the temperature and for the period stated on the label during which the Oral Solution may be expected to be satisfactory for use, not less than 80.0% of the stated amount of phenoxymethylpenicillin.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel silanised plate* (Merck silanised silica gel 60 plates are suitable) and a mixture of 20 volumes of *acetone* and 80 volumes of *mixed phosphate buffer pH 5.4* as the mobile phase. Apply separately to the plate 1 µl of each of the following solutions. For solution (1) dilute a volume of the oral solution containing the equivalent of 0.1 g of phenoxymethylpenicillin to 100 ml with *mixed phosphate buffer pH 5.4*. Solution (2) contains 0.11% w/v of *phenoxymethylpenicillin potassium BPCRS* in *mixed phosphate buffer pH 5.4*. After removal of the plate, allow it to dry in air, spray with 0.1M *sodium hydroxide*, heat at 50° for 10 minutes, allow to cool and spray with a mixture of 100 volumes of *starch mucilage*, 6 volumes of *glacial acetic acid* and 2 volumes of a 1% w/v solution of *iodine* in a 4% w/v solution of *potassium iodide*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Dilute a volume containing the equivalent of 25 mg of phenoxymethylpenicillin to 20 ml with *water*. To 10 ml add 0.5 ml of *neutral red solution* and sufficient 0.01M *sodium hydroxide* to produce a permanent orange colour and then add 1.0 ml of *penicillinase solution*. The colour changes rapidly to red.

ASSAY

To a weighed quantity of the oral solution containing the equivalent of 0.125 g of phenoxymethylpenicillin add sufficient *water* to produce 500 ml and dilute 25 ml to 100 ml with *water*. Place two 2 ml aliquots of the resulting solution into separate stoppered tubes. To one tube add 10 ml of *imidazole-mercury reagent*, mix, stopper the tube and immerse in a water bath at 60° for exactly 25 minutes, swirling occasionally. Remove from the water bath and cool rapidly to 20° (solution A). To the second tube add 10 ml of *water* and mix (solution B). Without delay measure the *absorbances* of solutions A and B at the maximum at 325 nm, Appendix II B, using in the reference cell a mixture of 2 ml of *water* and 10 ml of *imidazole-mercury reagent* for solution A and *water* for solution B. Calculate the content of $C_{16}H_{18}N_2O_5S$ from the difference between the absorbances of solutions A and B, from the difference obtained by repeating the operation using 0.14 g of *phenoxymethylpenicillin potassium BPCRS* in place of the oral solution and from the declared content of $C_{16}H_{18}N_2O_5S$ in *phenoxymethylpenicillin potassium BPCRS*. Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{16}H_{18}N_2O_5S$, weight in volume.

Repeat the procedure using a portion of the oral solution that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The Oral Solution should be stored at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of phenoxymethylpenicillin.

Phenoxymethylpenicillin Tablets

General Notices

Action and use

Penicillin antibacterial.

DEFINITION

Phenoxymethylpenicillin Tablets contain Phenoxymethylpenicillin Potassium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenoxymethylpenicillin, $C_{16}H_{18}N_20_5S$, calculated as the sum of the contents of phenoxymethylpenicillin and 4-hydroxyphenoxymethylpenicillin

92.5 to 107.5% of the stated amount of phenoxymethylpenicillin.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 80 mg of phenoxymethylpenicillin with *water*, dilute to 250 ml with *water* and filter. The *light absorption* of the filtrate, Appendix II B, exhibits maxima at 268 nm and 274 nm and a minimum at 272 nm.

B. Shake a quantity of the powdered tablets containing the equivalent of 10 mg of phenoxymethylpenicillin with 10 ml of *water*, filter and add 0.5 ml of *neutral red solution*. Add sufficient 0.01M *sodium hydroxide* to produce a permanent orange colour and then add 1.0 ml of *penicillinase solution*. The colour changes rapidly to red.

C. Ignite 0.5 g of the powdered tablets, add 5 ml of 2M *hydrochloric acid*, boil, cool and filter. The filtrate yields reaction B characteristic of *potassium salts*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of a 0.68% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 6.8 by the addition of 1M *sodium hydroxide* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 268 nm, Appendix II B. At the same time measure the *absorbance* at the maximum at 268 nm of a suitable solution of *phenoxymethylpenicillin potassium BPCRS* in a solution containing 0.68% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 6.8 by the addition of 1M *sodium hydroxide*. Calculate the total content of phenoxymethylpenicillin, $C_{16}H_{18}N_2O_5S$, in the medium from the absorbances obtained and from the declared content of $C_{16}H_{18}N_2O_5S$ in *phenoxymethylpenicillin potassium BPCRS*.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 0.125 g of phenoxymethylpenicillin with 300 ml of *water* for 30 minutes, add sufficient *water* to produce 500 ml, dilute 25 ml to 100 ml with *water* and filter. Place two 2 ml aliquots of the filtrate in separate stoppered tubes. To one tube add 10 ml of *imidazole-mercury reagent*, mix, stopper the tube and immerse in a water bath at 60° for exactly 25 minutes, swirling occasionally. Remove from the water bath and cool rapidly to 20° (solution A). To the second tube add 10 ml of *water* and mix (solution B). Without delay measure the *absorbances* of solutions A and B at the maximum at 325 nm, Appendix II B, using in the reference cell a mixture of 2 ml of *water* and 10 ml of *imidazole-mercury reagent* for solution A and *water* for solution B. Calculate the content of $C_{16}H_{18}N_2O_5S$ from the difference between the absorbances of solutions A and B, from the difference obtained by repeating the operation using 0.14 g of *phenoxymethylpenicillin potassium BPCRS* in place of the preparation being examined and from the declared content of $C_{16}H_{18}N_2O_5S$ in *phenoxymethylpenicillin potassium BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of phenoxymethyl-penicillin.

Phentolamine Injection

General Notices

Action and use

Alpha-adrenoceptor antagonist.

DEFINITION

Phentolamine Injection is a sterile solution of Phentolamine Mesilate in Water for Injections containing Anhydrous Glucose.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phentolamine mesilate, $C_{17}H_{19}N_3O,CH_4SO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Acidity

pH, 3.5 to 5.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 5 volumes of 13.5M *ammonia*, 15 volumes of *acetone* and 85 volumes of *butan-2-one* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) dilute the injection, if necessary, with *ethanol* (*96%*) to give a solution containing 1% w/v of Phentolamine Mesilate. For solution (2) dilute 1 volume of solution (1) to 20 volumes with *ethanol* (*96%*). For solution (3) dilute 1 volume of solution (1) to 200 volumes with *ethanol* (*96%*). Solution (4) contains 0.05% w/v of *phentolamine mesilate BPCRS* in *ethanol* (*96%*). After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Dilute a volume of the injection with *methanol* to produce a solution containing of 0.004% w/v of Phentolamine Mesilate. Measure the *absorbance* at the maximum at 278 nm, Appendix II B. Calculate the content of $C_{17}H_{19}N_3O,CH_4O_3S$ taking 204 as the value of A(1%, 1 cm) at the maximum at 278 nm.

STORAGE

Phentolamine Injection should be protected from light.

Phenylephrine Eye Drops

General Notices

Action and use

Alpha-adrenoceptor agonist.

DEFINITION

Phenylephrine Eye Drops are a sterile solution of Phenylephrine Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of phenylephrine hydrochloride $C_9H_{13}NO_2,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

B. To a volume containing 10 mg of Phenylephrine Hydrochloride diluted with *water* if necessary to produce 1 ml add 0.05 ml of *copper sulphate solution* and 1 ml of 5M *sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

TESTS

Acidity or alkalinity

pH, 3.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 5 volumes of *chloroform,* 15 volumes of 10M *ammonia* and 80 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute the eye drops with sufficient *methanol* to give a solution containing 2% w/v of Phenylephrine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 40 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *methanol*. Solution (4) contains 0.05% w/v of *phenylephrine hydrochloride BPCRS* in *methanol*. After removal of the plate, dry it in a current of cold air, spray with *ninhydrin solution*, heat at 100° to 105° for 5 to 10 minutes and examine in daylight. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. Solution (1) contains 0.1% w/v of *phenylephrine hydrochloride BPCRS* in *water*. For solution (2) dilute the eye drops with sufficient *water* to give a solution containing 0.1% w/v of Phenylephrine Hydrochloride.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil C18 is suitable) (b) a solution of 0.10% w/v *sodium heptanesulphonate* in a mixture of 2 volumes of *glacial acetic acid,* 400 volumes of *methanol* and 600 volumes of *water* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 273 nm.

Calculate the content of $C_9H_{13}NO_2,HCl$ using the declared content of $C_9H_{13}NO_2,HCl$ in *phenylephrine hydrochloride BPCRS*.

STORAGE

Phenylephrine Eye Drops should be protected from light.

Phenylephrine Injection

General Notices

Action and use

Alpha-adrenoceptor agonist.

DEFINITION

Phenylephrine Injection is a sterile solution of Phenylephrine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenylephrine hydrochloride, $C_9H_{13}NO_2,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

B. To a volume containing 10 mg of Phenylephrine Hydrochloride add, if necessary, sufficient *water* to produce 1 ml and then add 0.05 ml of *weak copper sulphate solution* and 1 ml of 5M *sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

C. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 4.5 to 6.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 5 volumes of *chloroform*, 15 volumes of 10M *ammonia* and 80 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) evaporate a volume of the injection containing 20 mg of Phenylephrine Hydrochloride to dryness and dissolve the residue in 1 ml of *methanol*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. For solution (3) dilute 1 volume of solution (2) to 2.5 volumes with *methanol*. Solution (4) contains 0.01% w/v of *phenylephrine hydrochloride BPCRS* in *methanol*. After removal of the plate, dry it in a current of cold air, spray with *ninhydrin solution*, heat at 100° to 105° for 10 minutes and examine in daylight. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

To a quantity containing 50 mg of Phenylephrine Hydrochloride add sufficient 0.5M *sulphuric acid* to produce 100 ml. Dilute 10 ml to 100 ml with 0.5M *sulphuric acid* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_9H_{13}NO_2,HCl$ taking 90 as the value of A(1%, 1 cm) at the maximum at 273 nm.

STORAGE

Phenylephrine Injection should be protected from light.

Phenytoin Capsules

General Notices

Action and use

Antiepileptic.

DEFINITION

Phenytoin Capsules contain Phenytoin Sodium.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Centrifuge the precipitated mixture obtained in test B, dissolve the residue in *methanol*, evaporate and dry at 105° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of phenytoin (*RS 272*).

B. Shake a quantity of the contents of the capsules containing 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. The filtrate yields a white precipitate on the addition of 2M *hydrochloric acid*.

C. To 0.1 g of the residue obtained in test A add 0.5 ml of 1M *sodium hydroxide*, 10 ml of a 10% w/v solution of *pyridine* and 1 ml of *copper sulphate-pyridine reagent* and allow to stand for 10 minutes. A blue precipitate is produced.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using as the coating substance a suitable silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (Merck silica gel 60 F_{254} is suitable) and a mixture of 10 volumes of 13.5M *ammonia,* 45 volumes of *chloroform* and 45 volumes of *propan-2-ol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.20 g of Phenytoin Sodium with 5 ml of *methanol*, warm on a water bath with shaking and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.020% w/v of *benzophenone* in *methanol*. Allow the plate to dry in a current of cold air for 2 minutes before development of the chromatograms. After removal of the plate, dry it at 80° for 5 minutes and examine under *ultraviolet light* (*254 nm*). In the chromatogram obtained with solution (1) any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 0.25 g of Phenytoin Sodium with 40 ml of 0.01M *sodium hydroxide* for 5 minutes and dilute to 50 ml with 0.01M *sodium hydroxide*. Centrifuge, acidify 25 ml of the clear liquid with 10 ml of 0.1M *hydrochloric acid* and extract with successive quantities of 50, 40 and 25 ml of *ether*. Wash the combined extracts with 10 ml of *water*, evaporate to dryness and dry the residue at 105°. Dissolve in 50 ml of *anhydrous pyridine* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using 0.1M *tetrabutylammonium hydroxide VS* as titrant and a 0.3% w/v solution of *thymol blue* in *anhydrous pyridine* as indicator. Each ml of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 27.43 mg of $C_{15}H_{11}N_2NaO_2$.

Phenytoin Injection

General Notices

Action and use

Antiepileptic.

DEFINITION

Phenytoin Injection is a sterile solution containing 5% w/v of Phenytoin Sodium in a mixture of 40% v/v of Propylene Glycol and 10% v/v of Ethanol in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$

4.75 to 5.25% w/v.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, of the residue obtained in the Assay for phenytoin sodium is concordant with the *reference spectrum* of phenytoin (*RS 272*).

B. Mix 0.2 g of the residue obtained in the Assay for phenytoin sodium with 1.4 g of *chlorotriphenylmethane* and 2 ml of *pyridine* and heat under a reflux condenser on a water bath for 1 hour. Cool, dissolve the mixture in 40 ml of warm *acetone*, add 50 mg of *activated charcoal*, mix well and filter. Evaporate the filtrate to about 20 ml and allow to stand overnight at about 4°. The *melting point* of the crystalline precipitate, after drying in a current of air, is about 176°, Appendix V A.

TESTS

Alkalinity

pH, 11.5 to 12.1, Appendix V L.

Weight per ml

1.025 to 1.035 g, Appendix V G.

Benzil and benzophenone

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 30 volumes of *1,4-dioxan* and 75 volumes of *hexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) dilute 1 ml of the injection to 2.5 ml with *methanol*. Solution (2) contains 0.010% w/v of *benzophenone* in *ethanol* (*96%*). Solution (3) contains 0.010% w/v of *benzil* in *ethanol* (*96%*) . After removal of the plate, allow the solvent to evaporate and examine under *ultraviolet light* (*254 nm*). In the chromatogram obtained with solution (1) any spots corresponding to benzophenone and benzil are not more intense than the spots in the chromatograms obtained with solutions (2) and (3) respectively (0.5% of each).

Ethanol

9.0 to 11.0% v/v, when determined by the following method. Carry out the method for *gas chromatography*, Appendix III B, using three solutions containing (1) 2% v/v of *propan-1-ol* (internal standard) and 2% v/v of *absolute ethanol*, (2) the injection diluted with *water* to contain 2% v/v of Ethanol and (3) the injection diluted with a solution of the internal standard to contain 2% v/v of Ethanol and 2% v/v of propan-1-ol.

The chromatographic procedure may be carried out using a column (1.8 m × 2 mm) packed with porous polymer beads (Chromosorb 102 is suitable) (80 to 100 mesh) and maintained at 120°.

Propylene glycol

37.0 to 43.0% v/v, when determined by the following method. Carry out the method for *gas chromatography*, Appendix III B, using solutions containing (1) 4% w/v of *ethane-1,2-diol* (internal standard) and 4% w/v of *propane-1,2-diol*, (2) the injection diluted with *water* to contain 4% w/v of Propylene Glycol and (3) the injection diluted with a solution of the internal standard to contain 4% w/v of Propylene Glycol and 4% w/v of the ethane-1,2-diol.

The chromatographic procedure may be carried out using the conditions described under Ethanol but maintaining the column at 175°.

Calculate the content of $C_3H_8O_2$, volume in volume, taking 1.036 g as its weight per ml.

ASSAY

To 6 g add 25 ml of *water* and extract with successive quantities of 50, 30 and 30 ml of *ethyl acetate*, shaking each extract thoroughly for 1 minute, allowing to stand for 5 minutes and again shaking for 1 minute before separating the solvent. Wash each extract by shaking thoroughly for 1 minute with the same 15 ml of *water*, filter the extracts successively and wash the filter with 10 ml of *ethyl acetate*. Evaporate the solvent from the combined filtrates and washing and dry the residue to constant weight at 105°. Each g of residue is equivalent to 1.087 g of $C_{15}H_{11}N_2NaO_2$. Using the *weight per ml* of the injection, calculate the content of $C_{15}H_{11}N_2NaO_2$, weight in volume.

STORAGE

Phenytoin Injection should be protected from light. Solutions in which a haziness or precipitate develops should not be used.

Phenytoin Oral Suspension

General Notices

Action and use

Antiepileptic.

DEFINITION

Phenytoin Oral Suspension is a suspension of Phenytoin in a suitable flavoured vehicle.
The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of phenytoin, $C_{15}H_{12}N_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum*, Appendix II A, of the final residue obtained in the Assay is concordant with the *reference spectrum* of phenytoin (*RS 272*).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Benzil and benzophenone

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 30 volumes of *1,4-dioxan* and 75 volumes of *hexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) add 5 ml of *water* and 2 ml of 2M *hydrochloric acid* to a quantity of the oral suspension containing 30 mg of Phenytoin, mix well and extract with five 20 ml quantities of *ether*. Combine the ether extracts, wash with three 10 ml quantities of *water*, evaporate to dryness and dissolve the residue in 1.5 ml of a mixture of 1 volume of *glacial acetic acid* and 9 volumes of *acetone*. Solution (2) contains 0.0040% w/v of *benzophenone* in *ethanol* (*96%*). Solution (3) contains 0.0040% w/v of *benzil* in *ethanol* (*96%*). After removal of the plate, allow the solvent to evaporate and examine under *ultraviolet light* (*254 nm*). Any spots corresponding to benzophenone and benzil in the chromatogram obtained with solution (1) are not more intense than the spots in the chromatograms obtained with solutions (2) and (3) respectively (0.2% of each).

ASSAY

To a weighed quantity containing 0.2 g of Phenytoin add 10 ml of 2M *hydrochloric acid* and 15 ml of *water*, extract with three 50 ml quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol* and evaporate the combined extracts to dryness. Dry the residue at

105° for 1 hour, cool and dissolve in a mixture of 3 ml of 1M *sodium hydroxide* and 50 ml of *water* with the aid of gentle heat. Cool and pass a current of *carbon dioxide* through the solution until precipitation of phenytoin is complete. Filter through a sintered-glass filter (ISO 4793, porosity grade 4, is suitable), wash the residue with two 10 ml quantities of *water* and dry at 105° for 2 hours. Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{15}H_{12}N_2O_2$, weight in volume.

Phenytoin Tablets

General Notices

Action and use

Antiepileptic.

DEFINITION

Phenytoin Tablets contain Phenytoin Sodium. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Phenytoin Sodium with 20 ml of *water*, filter, acidify with 2M *hydrochloric acid* and extract with *chloroform*. Wash the chloroform extract with *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of phenytoin (*RS 272*).

B. Triturate a quantity of the powdered tablets containing 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. Add 2M *hydrochloric acid*; a white precipitate is produced.

C. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Related substances

Complies with the test described under Phenytoin Capsules but using a quantity of the powdered tablets containing 0.2 g of Phenytoin Sodium to prepare solution (1).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.25 g of Phenytoin Sodium with 40 ml of 0.01M *sodium hydroxide* for 5 minutes and dilute to 50 ml with 0.01M *sodium hydroxide*. Centrifuge, acidify 25 ml of the clear liquid with 10 ml of 0.1M *hydrochloric acid* and extract with successive quantities of 50, 40 and 25 ml of *ether*. Wash the combined extracts with 10 ml of *water*, evaporate to dryness and dry the residue at 105°. Dissolve the residue in 50 ml of *anhydrous pyridine* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using 0.1M *tetrabutylammonium hydroxide VS* as titrant and a 0.3% w/v solution of *thymol blue* in *pyridine* as indicator. Each ml of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 27.43 mg of $C_{15}H_{11}N_2NaO_2$.

Pholcodine Linctus

General Notices

Action and use

Opioid receptor agonist; cough suppressant.

DEFINITION

Pholcodine Linctus is an *oral solution* containing 0.1% w/v of Pholcodine and 1% w/v of Citric Acid Monohydrate in a suitable flavoured vehicle.

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of pholcodine, $C_{23}H_{30}N_2O_4,H_2O$

0.090 to 0.110% w/v.

IDENTIFICATION

To 20 ml add 20 ml of *water*, make alkaline to *litmus paper* with 5M *ammonia*, extract with two 20 ml quantities of *chloroform*, washing each extract with 5 ml of *water*, dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness. If necessary add 0.1 ml of *ether* and scratch the side of the vessel with a glass rod to induce crystallisation. The crystals, dried at a pressure not exceeding 2 kPa, comply with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of pholcodine (*RS 273*).

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.01% w/v solution in 0.01M *sodium hydroxide* exhibits a maximum only at 284 nm.

C. Dissolve the remainder of the crystals in 1 ml of *sulphuric acid* and add 0.05 ml of *ammonium molybdate-sulphuric acid solution*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of 2M *nitric acid*; the colour changes to brownish red.

ASSAY

To 50 g add sufficient 5M *ammonia* to make the solution alkaline to *litmus paper* and extract with four 25-ml quantities of *chloroform*, washing each extract with the same 5 ml of *water*. Combine the extracts and evaporate until the volume is reduced to 15 ml. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *quinaldine red solution* as indicator. Each ml of 0.02M *perchloric acid VS* is equivalent to 4.165 mg of $C_{23}H_{30}N_2O_4,H_2O$. Determine the *weight per ml* of the linctus, Appendix V G, and calculate the content of $C_{23}H_{30}N_2O_4,H_2O$, weight in volume.

STORAGE

Pholcodine Linctus should be protected from light.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Phosphates Enema

General Notices

Sodium Phosphates Enema

DEFINITION

Phosphates Enema is a *rectal solution* containing suitable quantities of either Anhydrous Sodium Dihydrogen Phosphate, Sodium Dihydrogen Phosphate Monohydrate, Sodium Dihydrogen Phosphate Dihydrate or Phosphoric Acid and either Anhydrous Disodium Hydrogen Phosphate, Disodium Hydrogen Phosphate Dodecahydrate or Disodium Hydrogen Phosphate Dihydrate in freshly boiled and cooled Purified Water. A suitable antimicrobial preservative may be included.

The composition of two established formulations is described below.

Formula A

Sodium Dihydrogen Phosphate Dihydrate	160 g
Disodium Hydrogen Phosphate Dodecahydrate	60 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 ml

A suitable antimicrobial preservative may be included.

Formula B

Sodium Dihydrogen Phosphate Dihydrate	100 g
Disodium Hydrogen Phosphate Dodecahydrate	80 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 ml

A suitable antimicrobial preservative may be included.

The enema complies with the requirements stated under Rectal Preparations and with the following requirements.

Content of sodium dihydrogen phosphate dihydrate, $NaH_2PO_4,2H_2O$

Formula A: 15.2 to 16.8% w/v; *Formula B*: 9.5 to 10.5% w/v; *any other formulation*: 95.0 to 105.0% of the stated amount.

Content of disodium hydrogen phosphate dodecahydrate, $Na_2HPO_4,12H_2O$

Formula A: 5.6 to 6.4% w/v; *Formula B*: 7.5 to 8.5% w/v; *any other formulation*: 95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Yields the reactions characteristic of *sodium salts*, Appendix VI.

B. Yields the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Clarity and colour of solution

The enema being examined is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method II.

Acidity

pH, 5.0 to 6.2, Appendix V L.

ASSAY

For sodium dihydrogen phosphate dihydrate

To 20 ml add 80 ml of *water* and 25 g of *sodium chloride* and titrate with 0.5M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each ml of 0.5M *sodium hydroxide VS* is equivalent to 78.00 mg of $NaH_2PO_4,2H_2O$.

For disodium hydrogen phosphate dodecahydrate

Titrate 50 ml with 0.5M *hydrochloric acid VS* using 2 ml of a mixture of 4 volumes of *bromocresol green solution* and 1 volume of *methyl red solution* as indicator and titrating to the colour indicative of pH 4.4. Each ml of 0.5M *hydrochloric acid VS* is equivalent to 179.0 mg of $Na_2HPO_4,12H_2O$.

LABELLING

The label states (1) where appropriate, that the enema is Formula A or Formula B; (2) for any formulation other than Formula A or B, the content in terms of the amount or equivalent of Sodium Dihydrogen Phosphate Dihydrate and Disodium Hydrogen Phosphate Dodecahydrate; (3) the date after which the enema is not intended to be used; (4) the conditions under which it should be stored.

Phytomenadione Injection

General Notices

Action and use

Vitamin K analogue.

DEFINITION

Phytomenadione Injection is a sterile preparation of Phytomenadione in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of phytomenadione, $C_{31}H_{46}O_2$

90.0 to 115.0% of the stated amount.

CHARACTERISTICS

A clear to slightly opalescent liquid when maintained at a temperature below 25°.

IDENTIFICATION

A. Dilute with *absolute ethanol* to produce a solution containing 0.01% w/v of Phytomenadione. The *light absorption* of the solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 328 nm and a minimum at 292 nm.

B. Dilute a quantity of the solution used in test A with *absolute ethanol* to produce a solution containing 0.001% w/v of Phytomenadione. The *light absorption* of the solution, Appendix II B, in the range 230 to 350 nm exhibits maxima at 245, 249, 263 and 271 nm and minima at 256 nm and 266 nm.

TESTS

Acidity or alkalinity

pH, 5.0 to 7.5, Appendix V L.

ASSAY

Carry out in subdued light the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *phytomenadione EPCRS* in the mobile phase. For solution (2) dilute a volume of the injection containing 10 mg of Phytomenadione with sufficient of the mobile phase to produce 100 ml.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 95 volumes of *ethanol* (*96%*) and 5 volumes of *water* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{31}H_{46}O_2$ using the declared content of $C_{31}H_{46}O_2$ in *phytomenadione*

EPCRS.

STORAGE

Phytomenadione Injection deteriorates on exposure to light and should be stored in the dark. It should not be allowed to freeze.

LABELLING

The label states that the injection should not be used if separation has occurred or if oil droplets have appeared.

When vitamin K_1 injection is prescribed or demanded, Phytomenadione Injection shall be dispensed or supplied.

Phytomenadione Tablets

General Notices

Action and use

Vitamin K analogue.

DEFINITION

Phytomenadione Tablets contain Phytomenadione.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of phytomenadione, $C_{31}H_{46}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 50 mg of Phytomenadione with 50 ml of *absolute ethanol* for 1 hour, allow to stand and dilute 5 ml of the clear supernatant liquid to 50 ml with *absolute ethanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 328 nm and a minimum at 292 nm. Dilute a suitable volume of the solution with sufficient *absolute ethanol* to produce a solution containing 0.001% w/v of Phytomenadione. The *light absorption* of this solution, in the range 230 to 350 nm, exhibits maxima at 245, 249, 263 and 271 nm and minima at 256 nm and 266 nm.

TESTS

Disintegration

The requirement for Disintegration does not apply to Phytomenadione Tablets.

Menadione

Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *methanol*, 20 volumes of *ether* and 80 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 50 µl of each of the following solutions. For solution (1) disperse a quantity of the powdered tablets containing 50 mg of Phytomenadione in 5 ml of *absolute ethanol* with the aid of ultrasound for 5 minutes, add 15 ml of *2,2,4-trimethylpentane*, shake for 1 minute, centrifuge and use the supernatant liquid. Solution (2) contains 0.0025% w/v of *menadione* in *2,4,4-trimethylpentane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* corresponding to menadione in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Carry out in subdued light the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *phytomenadione EPCRS* in the mobile phase. For solution (2) add 5 ml of 0.5M *ammonia* to a quantity of the powdered tablets containing 10 mg of Phytomenadione and mix with the aid of ultrasound for 5 minutes. Add 90 ml of *ethanol* (*96%*) and mix with the aid of ultrasound for 10 minutes. Shake for 10 minutes, add sufficient *ethanol* (*96%*) to produce 100 ml, centrifuge and use the clear supernatant layer.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 5 volumes of *water* and 95 volumes of *ethanol* (*96%*) as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{31}H_{46}O_2$ using the declared content of $C_{31}H_{46}O_2$ in *phytomenadione EPCRS*.

LABELLING

The label states that the tablets should be chewed before swallowing or allowed to dissolve slowly in the mouth.

When vitamin K_1 tablets are prescribed or demanded, Phytomenadione Tablets shall be dispensed or supplied.

Pilocarpine Hydrochloride Eye Drops

General Notices

Action and use

Cholinoceptor agonist; treatment of glaucoma.

DEFINITION

Pilocarpine Hydrochloride Eye Drops are a sterile solution of Pilocarpine Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of pilocarpine hydrochloride, $C_{11}H_{16}N_2O_2$,HCl

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a volume containing 10 mg of Pilocarpine Hydrochloride add 0.1 ml of 1M *sulphuric acid* , 1 ml of *hydrogen peroxide solution* (*20 vol*), 1 ml of *toluene* and 0.05 ml of *potassium chromate solution*, shake well and allow to separate. The toluene layer is bluish violet and the aqueous layer remains yellow.

Pilocarpic acid

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) dilute a suitable volume with *water* to produce a solution containing 0.080% w/v of Pilocarpine Hydrochloride. For solution (2) dilute 2 volumes of solution (1) to 25 volumes with *water*. For solution (3) dissolve 8.0 mg of *pilocarpine nitrate BPCRS* in 10 ml of 0.0025M *sodium hydroxide*, heat in a boiling water bath for 30 minutes and cool.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase a mixture of 55 volumes of *methanol*, 60 volumes of *acetonitrile* and 885 volumes of 0.002M *tetrabutylammonium dihydrogen orthophosphate*, the pH of the mixture being adjusted to 7.75 using 6M *ammonia*, with a flow rate of 1.2 ml per minute and (c) a detection wavelength of 220 nm. Record the chromatogram of solution (1) for twice the retention time of the main peak.

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *pilocarpine nitrate BPCRS*.

In the chromatogram obtained with solution (1) the area of any peak corresponding to pilocarpic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (8%).

ASSAY

Use Method A for eye drops that contain less than 1% w/v of Pilocarpine Hydrochloride and in which benzalkonium chloride is used as an antimicrobial preservative. For other eye drops use Method B.

A. To 2 ml in a stoppered flask add 5 ml of *mixed phosphate buffer pH 10*, 5 ml of *chloroform* and 0.1 ml of *bromophenol blue solution*. Titrate slowly with 0.01M *sodium tetraphenylborate VS*, shaking well between successive small additions, until the chloroform layer becomes colourless. Using a further 2 ml of the eye drops, carry out the procedure described under Method B beginning at the words 'add 5 ml of *acetate buffer pH 3.7* ...'. The difference between the titrations at pH 3.7 and pH 10 represents the amount of sodium tetraphenylborate required.

B. Dilute if necessary with *water* to produce a solution containing 1% w/v of Pilocarpine Hydrochloride. To 2 ml add 5 ml of *acetate buffer pH 3.7* and 15 ml of 0.01M *sodium tetraphenylborate VS*, mix and allow to stand for 10 minutes. Filter, wash the container and filter with 5 ml of *water*, combine the filtrate and washings and titrate with 0.005M *cetylpyridinium chloride VS* using 0.5 ml of *bromophenol blue solution* as indicator. Repeat the operation without the preparation being examined. The difference between the titrations represents the amount of sodium tetraphenylborate required.

Each ml of 0.01M *sodium tetraphenylborate VS* is equivalent to 2.447 mg of $C_{11}H_{16}N_2O_2$,HCl.

Pilocarpine Nitrate Eye Drops

General Notices

Action and use

Cholinoceptor agonist; treatment of glaucoma.

DEFINITION

Pilocarpine Nitrate Eye Drops are a sterile solution of Pilocarpine Nitrate in Purified Water.
The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of pilocarpine nitrate, $C_{11}H_{16}N_2O_2,HNO_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Evaporate to dryness a volume containing 20 mg of Pilocarpine Nitrate on a water bath and heat for 1 hour at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pilocarpine nitrate (*RS 274*).

TESTS

Acidity

pH 2.5 to 4.2, Appendix V L.

Pilocarpic acid

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) dilute a suitable volume with *water* to produce a solution containing 0.080% w/v of Pilocarpine Nitrate. For solution (2) dilute 1 volume of solution (1) to 25 volumes with *water*. For solution (3) dissolve 8.0 mg of *pilocarpine nitrate BPCRS* in 10 ml of 0.0025M *sodium hydroxide*, heat in a boiling water bath for 30 minutes and cool.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase a mixture of 55 volumes of *methanol*, 60 volumes of *acetonitrile* and 885 volumes of 0.002M *tetrabutylammonium dihydrogen orthophosphate*, the pH of the mixture being adjusted to 7.75 using 6M *ammonia*, with a flow rate of 1.2 ml per minute and (c) a detection wavelength of 220 nm. Record the chromatogram of solution (1) for twice the retention time of the main peak.

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *pilocarpine nitrate BPCRS*.

In the chromatogram obtained with solution (1) the area of any peak corresponding to pilocarpic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (4.0%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using 20 µl of each of the following solutions. For solution (1) dilute a suitable volume of the eye drops with *water* to produce a solution containing 0.08% w/v of Pilocarpine Nitrate. Solution (2) contains 0.08% w/v of *pilocarpine nitrate BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase a mixture of 55 volumes of *methanol*, 60 volumes of *acetonitrile* and 885 volumes of 0.002M *tetrabutylammonium dihydrogen orthophosphate*, the pH of the mixture being adjusted to 7.75 using 6M *ammonia*, with a flow rate of 1.2 ml per minute and (c) a detection wavelength of 220 nm. Two major peaks are obtained with both solutions. Disregard the peak that is due to nitric acid and has the shorter retention time. Record the chromato-gram of solution (1) for twice the retention time of the principal peak.

Calculate the content of $C_{11}H_{16}N_2O_2,HNO_3$ using the declared content of $C_{11}H_{16}N_2O_2,HNO_3$ in *pilocarpine nitrate BPCRS*.

Pimozide Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Pimozide Tablets contain Pimozide.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pimozide, $C_{28}H_{29}F_2N_3O$

95.0% to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 20 mg of Pimozide with 20 ml of *dichloromethane* for 5 minutes, filter through a glass microfibre filter (Whatman GF/C is suitable) and evaporate the filtrate to dryness under reduced pressure. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pimozide (*RS 389*).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.01M *hydrochloric acid* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 20 ml of the medium and filter through a 0.45-µm polytetrafluoroethylene filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the solution from the sample, if necessary, with the dissolution medium to give a solution containing 0.0002% w/v of Pimozide. Solution (2) contains 0.0002% w/v of *pimozide BPCRS*.

The chromatographic procedure described under Related substances may be used.

Calculate the total content of pimozide, $C_{28}H_{29}F_2N_3O$, in the medium using the declared content of $C_{28}H_{29}F_2N_3O$ in *pimozide BPCRS*.

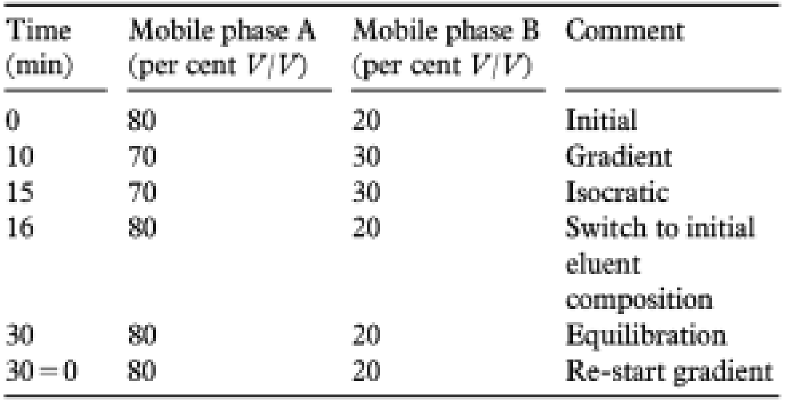
Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of *methanol* to a quantity of the powdered tablets containing 40 mg of Pimozide, shake for 30 minutes, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid through a 0.45-µm polytetrafluoro-ethylene filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.005% w/v of *pimozide BPCRS* and 0.002% w/v of *mebendazole* in *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil ODS is suitable). Carry out a linear gradient elution with a flow rate of 2 ml per minute using the following conditions.

Mobile phase A A solution containing 0.25% w/v of *ammonium acetate* and 0.85% w/v of *tetrabutylammonium hydrogen sulphate*.

Mobile phase B *Acetonitrile*.



Time (min)	Mobile phase A (per cent *V*/*V*)	Mobile phase B (per cent *V*/*V*)	Comment
0	80	20	Initial
10	70	30	Gradient
15	70	30	Isocratic
16	80	20	Switch to initial eluent composition
30	80	20	Equilibration
30 = 0	80	20	Re-start gradient

Use a detection wavelength of 280 nm. Equilibrate the column for at least 10 minutes with the initial mobile phase.

Inject 10 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 5.0. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.75%).

Uniformity of content

Tablets containing 2 mg or less of Pimozide comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. For solution (1) shake one tablet with 7 ml of *methanol* for 30 minutes, dilute with sufficient *methanol* to produce a solution containing 0.01% w/v of Pimozide, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid through a 0.45-µm polytetrafluoroethylene filter. Solution (2) contains 0.010% w/v of *pimozide BPCRS* in *methanol*. Solution (3) contains 0.005% w/v of *pimozide BPCRS* and 0.002% w/v of *mebendazole* in *methanol*.

The chromatographic procedure described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 5.0.

Calculate the content of $C_{28}H_{29}F_2N_3O$ in each tablet using the declared content of $C_{28}H_{29}F_2N_3O$ in *pimozide BPCRS.*

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Pimozide with 35 ml of *methanol* for 30 minutes, dilute to 50 ml with *methanol,* mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid through a 0.45-µm polytetrafluoroethylene filter. Solution (2) contains 0.04% w/v of *pimozide BPCRS* in *methanol*. Solution (3) contains 0.004% w/v of *pimozide BPCRS* and 0.002% w/v of *mebendazole EPCRS* in *methanol*.

The chromatographic procedure described under Related substances may be used.

Inject 10 µl of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 5.0.

Calculate the content of $C_{28}H_{29}F_2N_3O$ in the tablets using the declared content of $C_{28}H_{29}F_2N_3O$ in *pimozide BPCRS*.

STORAGE

Pimozide Tablets should be kept protected from light.

Pindolol Tablets

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Pindolol Tablets contain Pindolol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pindolol, $C_{14}H_{20}N_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Pindolol with 80 ml of *ether* for 30 minutes, filter and dry the extract with *anhydrous sodium sulphate*. Filter the dried extract, remove the ether using a rotary evaporator and dry the residue over *phosphorus pentoxide* at 110° at a pressure not exceeding 2 kPa for 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of pindolol (*RS 275*).

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits two maxima, at 264 nm and 287 nm.

C. Shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of a mixture of 1 volume of *glacial acetic acid* and 99 volumes of *methanol* for 45 minutes. Centrifuge and dilute 1 ml of the supernatant liquid to 50 ml with the acetic acid-methanol mixture. To 2 ml of this solution add 1 ml of *dimethylaminobenzaldehyde solution R7*. A violet-blue colour is produced.

Related substances

Carry out the following procedure as rapidly as possible protected from light. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a freshly prepared mixture of 4 volumes of 13.5M *ammonia*, 50 volumes of *ethyl acetate* and 50 volumes of *methanol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of a mixture of 1 volume of *glacial acetic acid* and 99 volumes of *methanol* for 15 minutes, centrifuge and use the supernatant liquid; apply to the plate as the last solution. For solution (2) dilute 1 volume of solution (1) to 10 volumes with the acetic acid-methanol mixture and further dilute 7 volumes of this solution to 100 volumes with the same solvent mixture. For solution (3) dilute 1 volume of solution (1) to 10 volumes with the acetic acid-methanol mixture and further dilute 3 volumes of this solution to 100 volumes with the same solvent mixture. Develop the chromatograms without delay. After removal of the plate, spray immediately with *dimethylaminobenzaldehyde solution R7* and warm at 50° for 20 minutes. Any spot with an Rf value of about 0.1 in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.7%). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%). Disregard any spot remaining on the line of application.

ASSAY

Shake a quantity of whole tablets containing 90 mg of Pindolol with 90 ml of *methanol* for 45 minutes. Centrifuge and dilute 15 ml of the supernatant liquid to 100 ml with *methanol*. Dilute 5 ml of this solution to 50 ml with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 264 nm, Appendix II B. Calculate the content of $C_{14}H_{20}N_2O_2$ taking 338 as the value of A(1%, 1 cm) at the maximum at 264 nm. Make no allowance for the fact that fewer than 20 tablets may have been taken.

STORAGE

Pindolol Tablets should be protected from light.

Piperacillin Intravenous Infusion

General Notices

Action and use

Penicillin antibacterial.

DEFINITION

Piperacillin Intravenous Infusion is a sterile solution of piperacillin sodium in Water for Injections. It is prepared by dissolving Piperacillin for Intravenous Infusion in the requisite amount of Water for Injections before use.

The intravenous infusion complies with the requirements stated under Parenteral Preparations.

STORAGE

Piperacillin Intravenous Infusion should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

PIPERACILLIN FOR INTRAVENOUS INFUSION

DEFINITION

Piperacillin for Intravenous Infusion is a sterile material consisting of either Piperacillin Sodium or piperacillin sodium prepared by the interaction of Piperacillin with Sodium Bicarbonate, with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of anhydrous piperacillin, $C_{23}H_{27}N_5O_7S$

94.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powder containing the equivalent of 0.25 g of anhydrous piperacillin in 20 ml of *water*, add 0.5 ml of *dilute hydrochloric acid*, mix well, allow to stand until a precipitate appears and filter through a membrane filter (Millipore GS or HA is suitable). The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the spectrum of *piperacillin EPCRS*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

Piperacillin Intravenous Infusion prepared from Piperacillin Sodium complies with the following additional test.

C. Yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity

pH of a solution containing the equivalent of 20% w/v of anhydrous piperacillin, 4.8 to 6.8, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of the container in sufficient of the mobile phase to produce a solution containing the equivalent of 0.039% w/v of anhydrous piperacillin.

(2) 0.0008% w/v of *piperacillin EPCRS* in the mobile phase.

(3) 0.0004% w/v of *piperacillin EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak with a retention time relative to piperacillin of about 0.6 is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with solution (3) (3.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Water

Not more than 2% w/w, Appendix IX C. Use 0.5 g.

If the contents of the sealed container have been freeze-dried *in situ*, not more than 0.9% w/w, Appendix IX C. Use 0.5 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of a sealed container in *water BET* to give a solution containing the equivalent of 50 mg of anhydrous piperacillin per ml (solution A). The endotoxin limit concentration of solution A is 2.5 IU of endotoxin per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Determine the weight of 10 containers as described in the test for Uniformity of weight under Parenteral Preparations, Powders for Injections.

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions.

(1) Dissolve a quantity of the mixed contents of the 10 containers in sufficient of the mobile phase to produce a solution containing the equivalent of 0.039% w/v of anhydrous

piperacillin.

(2) Dissolve 40 mg of *piperacillin EPCRS* in *methanol* and dilute to 100 ml with the mobile phase.

(3) 0.01% w/v of *anhydrous ampicillin BPCRS* and 0.02% w/v of *piperacillin EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 to 10 µm) (Beckman Ultrasphere ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µl of each solution.

MOBILE PHASE

3 volumes of 0.4M *tetrabutylammonium hydroxide*, 100 volumes of 0.2M *sodium dihydrogen orthophosphate monohydrate*, 447 volumes of *water* and 450 volumes of *methanol* which has been allowed to cool and the pH adjusted initially to 5.6 with 20% w/v *orthophosphoric acid* and finally to 5.5 with 2% w/v *orthophosphoric acid*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 16.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{27}N_5O_7S$ in a container of average content weight from the declared content of $C_{23}H_{27}N_5O_7S$ in *piperacillin EPCRS*.

STORAGE

The sealed container should be protected from moisture.

LABELLING

The label of the sealed container states the quantity of active ingredient contained in it in terms of the equivalent amount of anhydrous piperacillin.

Piperazine Citrate Elixir

General Notices

Piperazine Citrate Oral Solution

Action and use

Antihelminthic.

DEFINITION

Piperazine Citrate Elixir is an *oral solution* containing 18.75% w/v of Piperazine Citrate in a suitable flavoured vehicle.

The elixir complies with the requirements stated under Oral Liquids and with the following requirements.

Content of piperazine citrate, $(C_4H_{10}N_2)_3,2C_6H_8O_7$

15.3 to 17.7% w/v.

IDENTIFICATION

A. To 1 ml add 5 ml of 2M *hydrochloric acid* and, with stirring, 1 ml of a freshly prepared 50% w/v solution of *sodium nitrite*, cool in ice for 15 minutes, induce crystallisation, wash the crystalline precipitate with *water* and dry at 105°. The *melting point* is about 159°, Appendix V A.

B. Warm 10 ml with *activated charcoal* and filter. Boil a portion of the filtrate with an excess of *mercury(II) sulphate solution*, filter, boil the filtrate and add 0.25 ml of *dilute potassium permanganate solution*. The potassium permanganate solution is decolourised and a white precipitate is produced.

C. Acidify a portion of the filtrate obtained in test B with 1M *sulphuric acid*, add 0.25 ml of *dilute potassium permanganate solution*, warm until the colour is discharged and add an excess of *bromine water*. A white precipitate is produced either immediately or on cooling.

TESTS

Weight per ml

1.20 to 1.30 g, Appendix V G.

ASSAY

To 1.5 g add 3.5 ml of 0.5M *sulphuric acid* and 10 ml of *water*, add 100 ml of *picric acid solution R1*, heat on a water bath for 15 minutes, allow to stand for 1 hour and filter through a sintered-glass filter (ISO 4793, porosity grade 4, is suitable). Wash the residue with successive 10 ml quantities of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate, then wash the residue with five 10 ml quantities of *absolute ethanol* and dry to constant weight at 105°. Each g of residue is equivalent to 0.3935 g of $(C_4H_{10}N_2)_3,2C_6H_8O_7$. Use the weight per ml of the elixir to calculate the percentage weight in volume of $(C_4H_{10}N_2)_3,2C_6H_8O_7$.

STORAGE

Piperazine Citrate Elixir should be protected from light.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Piperazine Citrate Elixir contains, in 5 ml, the equivalent of about 750 mg of piperazine hydrate.

Piperazine Phosphate Tablets

General Notices

Action and use

Antihelminthic.

DEFINITION

Piperazine Phosphate Tablets contain Piperazine Phosphate. If the tablets are intended to be chewed before swallowing they may contain suitable flavouring agents.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of piperazine phosphate, $C_4H_{10}N_2,H_3PO_4,H_2O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 1 g of Piperazine Phosphate with 20 ml of *water* and filter. The filtrate complies with the following tests.

A. Dilute 1 ml to 5 ml with *water*, add 0.5 g of *sodium hydrogen carbonate*, 0.5 ml of a freshly prepared 5% w/v solution of *potassium hexacyanoferrate*(*III*) and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes. A reddish colour is produced slowly.

B. To 4 ml add 1 ml of *hydrochloric acid* and, with stirring, 1 ml of a 50% w/v solution of *sodium nitrite* and cool in ice for 15 minutes, stirring if necessary to induce crystallisation. The *melting point* of the crystals, after washing with 10 ml of cold *water* and drying at 105°, is about 159°, Appendix V A.

C. Yields the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Disintegration

The requirement for Disintegration does not apply to Piperazine Phosphate Tablets intended to be chewed before swallowing.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.15 g of Piperazine Phosphate with 10 ml of *water* for 1 hour, filter and wash the residue with two 10 ml quantities of *water*. To the combined extract and washings add 5 ml of 1M *sulphuric acid* and 50 ml of *picric acid solution R1*, bring to the boil, allow to stand for several hours, filter through a sintered-glass crucible (ISO 4793, porosity grade 4, is suitable) and wash the residue with successive 10 ml quantities of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five 10 ml quantities of *absolute ethanol* and dry to constant weight at 100° to 105°. Each g of residue is equivalent to 0.3714 g of $C_4H_{10}N_2,H_3PO_4,H_2O$.

LABELLING

The label states, where applicable, that the tablets are to be chewed before swallowing.

520 mg of Piperazine Phosphate is approximately equivalent to 500 mg of piperazine hydrate.

Piroxicam Capsules

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Piroxicam Capsules contain Piroxicam.
The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of piroxicam, $C_{15}H_{13}N_3O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

2-Pyridylamine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 1 volume of *diethylamine* and 8 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 80 mg of Piroxicam with 25 ml of *dichloromethane*, filter, evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 2 ml of *dichloromethane*. Solution (2) contains 0.010% w/v of *2-pyridylamine* in *dichloromethane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any spot corresponding to 2-pyridylamine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *glacial acetic acid* and 90 volumes of *toluene* as the mobile phase. Apply separately to the plate 7.5 µl of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 80 mg of Piroxicam with 25 ml of *dichloromethane*, filter, evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 2 ml of *dichloromethane*. For solution (2) dilute 1 ml of solution (1) to 20 ml with *dichloromethane*. Solution (3) contains 0.20% w/v of *piroxicam*

BPCRS in *dichloromethane*. For solution (4) dilute 2 ml of solution (2) to 50 ml with *dichloromethane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (0.2%). Disregard any spot remaining on the line of application.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a 10 ml sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 242 nm, Appendix II B. Calculate the total content of piroxicam, $C_{15}H_{13}N_3O_4S$, in the medium taking 352 as the value of A(1%, 1 cm) at the maximum at 242 nm.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add a quantity of the mixed contents of 20 capsules containing 10 mg of Piroxicam to 150 ml of 0.01M *methanolic hydrochloric acid*, mix with the aid of ultrasound for 30 minutes, cool and dilute to 200 ml with the same solvent, filter through glass-fibre paper (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.005% w/v of *piroxicam BPCRS* in 0.01M *methanolic hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 60 volumes of *methanol* and 40 volumes of a buffer solution prepared by adding a solution containing 5.35 g of *disodium hydrogen orthophosphate* in 100 ml of *water* to a solution containing 7.72 g of *citric acid* in 400 ml of *water* and diluting to 1000 ml and (c) a detection wavelength of 242 nm.

Calculate the content $C_{15}H_{13}N_3O_4S$ using the declared content of $C_{15}H_{13}N_3O_4S$ in *piroxicam BPCRS*.

Piroxicam Gel

General Notices

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Piroxicam Gel contains Piroxicam.
The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of piroxicam, $C_{15}H_{13}N_3O_4S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 1 volume of *glacial acetic acid*, 10 volumes of *methanol* and 80 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) mix a quantity of the gel containing 10 mg of Piroxicam with 0.1 ml of a saturated solution of *sodium chloride* until the mixture becomes turbid. Dilute to 5 ml with 0.01M *methanolic hydrochloric acid*, shake well, centrifuge and use the clear supernatant solution. Filter the supernatant solution if necessary. Solution (2) contains 0.2% w/v of *piroxicam BPCRS* in 0.01M *methanolic hydrochloric acid*. After removal of the plate, dry it in a current of air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH of a 10% w/v solution of the gel, 7.2 to 8.2, Appendix V L.

2-Pyridylamine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of 0. 01M *methanolic hydrochloric acid* to a quantity of the gel containing 5 mg of Piroxicam, shake gently for 30 minutes, add 50 ml of the mobile phase and shake vigorously for 30 minutes. Dilute to 100 ml with the mobile phase, mix and filter through a glass fibre membrane filter (1µm). For solution (2) dilute 5 volumes of a 0.00050% w/v solution of 2-*pyridylamine* in 0.01M *methanolic hydrochloric acid* to 100 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm

× 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Zorbax stablebond C8 is suitable) and a stainless steel guard column (10 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm), both columns maintained at 40°, (b) a mixture of 15 volumes of *methanol*, 30 volumes of *acetonitrile* and 55 volumes of 0.05M *sodium dihydrogen orthophosphate* previously adjusted to pH 3.5 with 5M *orthophosphoric acid* as the mobile phase with a flow rate of 1.0 ml per minute and (c) a fluorimetric detector with an excitation wavelength of 313 nm and an emission wavelength of 380 nm.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-pyridylamine is not greater than that of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of 0. 01M *methanolic hydrochloric acid* to a quantity of the gel containing 5 mg of Piroxicam, shake gently for 30 minutes, add 50 ml of the mobile phase and shake vigorously for 30 minutes. Dilute to 100 ml with the mobile phase, mix and filter through a glass fibre membrane filter (1 µm). For solution (2) prepare a 0.10% w/v solution of *piroxicam BPCRS* in 0.01M *methanolic hydrochloric acid*, with the aid of ultrasound if necessary, and dilute 5 volumes of this solution to 100 volumes with the mobile phase.

The chromatographic procedure described under 2-Pyridylamine may be used but use an ultraviolet spectrophotometer detector at a wavelength of 248 nm.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the gel using the declared content of $C_{15}H_{13}N_3O_4S$ in *piroxicam BPCRS*.

Pizotifen Tablets

General Notices

Action and use

Serotonin (5HT) receptor partial agonist; prophylaxis of migraine.

DEFINITION

Pizotifen Tablets contain Pizotifen Malate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pizotifen, $C_{19}H_{21}NS$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing the equivalent of 10 mg of pizotifen add 50 ml of *water*, mix with the aid of ultrasound for 15 minutes and centrifuge. Make the clear supernatant liquid alkaline with 5M *sodium hydroxide* and extract with three 25 ml quantities of *ether*, washing each extract with the same 20 ml of *water*. Combine the ether extracts, dry with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pizotifen (*RS 276*).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to the spot in the chromatogram obtained with solution (2).

C. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to pizotifen in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 1 volume of 13.5M *ammonia*, 15 volumes of *absolute ethanol* and 85 volumes of *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions prepared using a mixture of 200 volumes of *methanol*, 100 volumes of *chloroform* and 3 volumes of 13.5M *ammonia* (solvent A). For solution (1) mix a quantity of the powdered tablets containing the equivalent of 6 mg of pizotifen with 60 ml of solvent A for 20 minutes, centrifuge, evaporate 50 ml of the clear supernatant liquid to dryness at 40° at a pressure of 2 kPa and dissolve the residue in 2 ml of solvent A. Centrifuge and use the supernatant liquid. Solution (2) contains 0.36% w/v of *pizotifen malate BPCRS* in solvent A. For solution (3) dilute 1 volume of solution (1) to 100 volumes with solvent A. For solution (4) dilute 1 volume of solution (3) to 2 volumes with solvent A. After removal of the plate, dry it in a current of warm air for 5 minutes, spray with a mixture of 1 volume of *potassium iodobismuthate solution* and 10 volumes of 2M *acetic acid* and then with *hydrogen peroxide solution* (*10 vol*), cover immediately with a glass plate and examine in daylight. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (1%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.5%). Disregard any spots with Rf values lower than 0.1.

Uniformity of content

Tablets containing less than the equivalent of 2 mg of pizotifen comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0073% w/v of *pizotifen malate BPCRS* in the mobile phase. For solution (2) add sufficient mobile phase to one tablet to produce a solution containing the equivalent of 0.0050% w/v of pizotifen, mix with the aid of ultrasound until the tablet has disintegrated, stir for 15 minutes and centrifuge.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable) and a pre-column (1 cm × 4.6 mm) packed with the same material placed between the pump and the injector, (b) a mixture of 0.3 volume of *triethylamine*, 45 volumes of *water* and 55 volumes of *acetonitrile* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 256 nm.

Calculate the content of pizotifen, $C_{19}H_{21}NS$, using the declared content of $C_{19}H_{21}NS$ in *pizotifen malate BPCRS*.

ASSAY

Calculate the content of $C_{19}H_{21}NS$ using the average of the 10 results obtained in the test for Uniformity of content.

STORAGE

Pizotifen Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of pizotifen.

Poldine Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Poldine Tablets contain Poldine Metilsulfate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of poldine metilsulfate, $C_{22}H_{29}NO_7S$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 2 mg of Poldine Metilsulfate with 10 ml of *water* and allow to stand. Decant the supernatant liquid, add 20 ml of *ammonium cobaltothiocyanate solution* and 5 ml of *chloroform* and shake well. The chloroform layer becomes blue.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 5 volumes of *formic acid*, 5 volumes of *water,* 30 volumes of *methanol* and 60 volumes of *chloroform* as the mobile phase. Apply separately to the plate 50 µl of each of the following solutions. For solution (1) add 4 ml of *methanol* to a quantity of the powdered tablets containing 20 mg of Poldine Metilsulfate, mix with the aid of ultrasound for 5 minutes, centrifuge and to 1 ml of the supernatant liquid add 0.2 ml of *formic acid*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of 5 volumes of *methanol* and 1 volume of *formic acid*. After removal of the plate, allow it to dry in air, spray with a 50% v/v solution of *sulphuric acid* and heat at 110° for 20 minutes. Any pink *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%). Disregard any brown spots due to excipients in the chromatogram obtained with solution (1).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 2 mg of Poldine Metilsulfate with 10 ml of *water* for 10 minutes and allow to stand. To 5 ml of the supernatant liquid add 20 ml of *ammonium cobaltothiocyanate solution*, shake vigorously for 1 minute and allow to stand for 5 minutes. Extract with four 5 ml quantities of *chloroform*, add to the combined extracts sufficient *chloroform* to produce 25 ml and centrifuge. Measure the *absorbance* of the clear, chloroform solution at the maximum at 322 nm, Appendix II B. Repeat the operation using 5 ml of a 0.02% w/v solution of *poldine metilsulfate BPCRS* beginning at the words 'add 20 ml …'. Calculate the content of $C_{22}H_{29}NO_7S$ in the tablets from the absorbances obtained using the declared content of $C_{22}H_{29}NO_7S$ in *poldine metilsulfate BPCRS.*

Polymyxin and Bacitracin Eye Ointment

General Notices

Action and use

Antibacterial and Polypeptide antibacterial.

DEFINITION

Polymyxin and Bacitracin Eye Ointment is a sterile preparation containing Polymyxin B Sulphate and Bacitracin Zinc in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 60 volumes of *propan-2-ol*, 40 volumes of *water* and 10 volumes of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) add 20 ml of *chloroform* to a quantity of the eye ointment containing 2500 IU of Bacitracin Zinc, shake, add 5 ml of 0.1M *hydrochloric acid*, shake vigorously, centrifuge and use the aqueous layer. Solution (2) contains 0.13% w/v of *polymyxin B sulphate EPCRS* in 0.1M *hydrochloric acid*. Solution (3) contains 0.75% w/v of *bacitracin zinc EPCRS* in 0.1M *hydrochloric acid*. After removal of the plate, dry it at 105°, spray with a 0.5% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 15 minutes. The two principal spots in the chromatogram obtained with solution (1) correspond to those in the chromatograms obtained with solutions (2) and (3).

ASSAY

For polymyxin B sulphate

To a quantity containing 10,000 IU of Polymyxin B Sulphate add 15 ml of *chloroform* and 40 ml of sterile *phosphate buffer pH 6.0*, mix thoroughly, centrifuge and discard the chloroform layer. Using the aqueous layer, carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated number of IU of Polymyxin B Sulphate.

For bacitracin zinc

To a quantity containing 500 IU of Bacitracin Zinc add 15 ml of *chloroform* and 40 ml of 0.01M *hydrochloric acid*, mix thoroughly, centrifuge and discard the chloroform layer. Using the aqueous layer, carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated number of IU of Bacitracin Zinc.

LABELLING

The strength is stated as the number of IU (Units) of Polymyxin B Sulphate per g and the number of IU (Units) of Bacitracin Zinc per g.

Polythiazide Tablets

General Notices

Action and use

Thiazide diuretic.

DEFINITION

Polythiazide Tablets contain Polythiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of polythiazide, $C_{11}H_{13}ClF_3N_3O_4S_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF$_{254}$* as the coating substance and a mixture of 20 volumes of *acetone*, 30 volumes of *ether* and 50 volumes of *toluene* as the mobile phase. Apply separately to the plate 20 µl of each of following solutions. For solution (1) use the supernatant liquid obtained by extracting a quantity of the powdered tablets containing 4 mg of Polythiazide with 20 ml of *methanol* and centrifuging. Solution (2) contains 0.02% w/v of *polythiazide BPCRS* in *methanol*. After removal of the plate, allow it to dry in air until the solvent has evaporated, examine under *ultraviolet light* (*254 nm*) and then treat the plate by *Method I* and examine again. The principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *methanol* and 90 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of solution (1) and quantities of 2, 4, 6, 8 and 10 µl of solution (2). For solution (1) use the supernatant liquid obtained by shaking a quantity of the powdered tablets containing 10 mg of Polythiazide with 2 ml of *acetone* and centrifuging. For solution (2) dilute 1 volume of solution (1) to 50 volumes with *acetone*. After removal of the plate, allow it to dry in air and reveal the spots using *Method I*. Assess the intensity of any *secondary spot* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with the applications of solution (2). The sum of the intensities so assessed does not exceed 3% of that of the spot in the chromatogram obtained with solution (1) and no such spot is more intense than the spot in the chromatogram obtained with 10 µl of solution (2) (2%). Disregard any brown spot.

Uniformity of content

Tablets containing less than 2 mg of Polythiazide comply with the requirements stated under

Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a 0.004% w/v solution of *polythiazide BPCRS* in *methanol* with an equal volume of 0.1M *potassium dihydrogen orthophosphate* adjusted to pH 3.5 with *orthophosphoric acid* (buffer solution). For solution (2) shake one tablet with 25 ml of the buffer solution for 10 minutes, add 25 ml of *methanol* and shake for a further 20 minutes. Centrifuge 5 ml of the resulting solution for 5 minutes at 2000 revolutions per minute and use the supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 55 volumes of 0.1M *potassium dihydrogen orthophosphate* adjusted to pH 3.5 with *orthophosphoric acid* and 45 volumes of *methanol* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 268 nm.

Calculate the content of $C_{11}H_{13}ClF_3N_3O_4S_3$ using the declared content of $C_{11}H_{13}ClF_3N_3O_4S_3$ in *polythiazide BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a 0.004% w/v solution of *polythiazide BPCRS* in *methanol* with an equal volume of 0.1M *potassium dihydrogen orthophosphate* adjusted to pH 3.5 with *orthophosphoric acid* (buffer solution). For solution (2) shake a quantity of the powdered tablets containing 4 mg of Polythiazide with 100 ml of *methanol* for 20 minutes, filter and mix equal volumes of the filtrate and the buffer solution.

The chromatographic procedure may be carried out using the conditions described under Uniformity of content.

Calculate the content of $C_{11}H_{13}ClF_3N_3O_4S_3$ using the declared content of $C_{11}H_{13}ClF_3N_3O_4S_3$ in *polythiazide BPCRS*.

STORAGE

Polythiazide Tablets should be protected from light.

Potassium Chloride and Glucose Intravenous Infusion

General Notices

Potassium Chloride and Dextrose Injection; Potassium Chloride and Glucose Injection; Potassium Chloride and Dextrose Intravenous Infusion

DEFINITION

Potassium Chloride and Glucose Intravenous Infusion is a sterile solution of Potassium Chloride and either Anhydrous Glucose or Glucose in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

Content of glucose, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or faintly straw-coloured solution.

IDENTIFICATION

A. When heated with *cupri-tartaric solution R1* a copious precipitate of copper(I) oxide is produced.

B. The residue on evaporation yields the reactions characteristic *of potassium salts* and of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L.

5-Hydroxymethylfurfural and related substances

Dilute a volume containing 1.0 g of glucose, $C_6H_{12}O_6$, to 500 ml with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

Sodium

The content of Na is not more than 1.0% of the content of K, calculated from the content of potassium chloride determined in the Assay. Determine the content of Na by Method II for *atomic emission spectrophotometry*, Appendix II D, measuring at 589 nm and using *sodium standard solution* (*200 ppm Na*), diluted if necessary with *water*, to prepare the standard solutions.

Bacterial endotoxins

The endotoxin limit concentration is 0.25 IU per ml, Appendix XIV C.

ASSAY

For potassium chloride

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, to prepare the standard solutions.

For glucose

To a quantity containing 2 to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 ml of 5M *ammonia* and sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and measure the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight in g of glucose, $C_6H_{12}O_6$, in the quantity of the intravenous infusion taken for assay.

LABELLING

The strength is stated as the percentages w/v of Potassium Chloride and of glucose, $C_6H_{12}O_6$.

When the preparation is intended for intravenous infusion, the label also states (1) that rapid infusion may be harmful; (2) the approximate concentrations, in millimoles per litre, of the potassium ions and the chloride ions and the number of grams per litre of glucose, $C_6H_{12}O_6$.

For a preparation containing 0.3% w/v of Potassium Chloride, the concentration of each ion is stated as 40 millimoles per litre.

Potassium Chloride and Sodium Chloride Intravenous Infusion

General Notices

Potassium Chloride and Sodium Chloride Injection

DEFINITION

Potassium Chloride and Sodium Chloride Intravenous Infusion is a sterile solution of Potassium Chloride and Sodium Chloride in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

Content of sodium chloride, NaCl

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

The residue on evaporation yields the reactions characteristic of *potassium salts*, the reactions characteristic of *sodium salts* and the reactions characteristic of *chlorides*, Appendix VI.

Bacterial endotoxins

The endotoxin limit concentration is 0.25 IU per ml, Appendix XIV C.

ASSAY

For potassium chloride

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, to prepare the standard solutions.

For sodium chloride

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 589 nm and using *sodium standard solution* (*200 ppm Na*), suitably diluted with *water*, to prepare the standard solutions.

LABELLING

The strength is stated as the percentages w/v of Potassium Chloride and of Sodium Chloride.

When the preparation is intended for intravenous infusion, the label also states (1) that rapid infusion may be harmful; (2) the approximate concentrations, in millimoles per litre, of the potassium ions, the sodium ions and the chloride ions.

For a preparation containing 0.3% w/v of Potassium Chloride and 0.9% w/v of Sodium Chloride, the concentrations of the ions are stated as 40 millimoles of potassium, 150 millimoles of sodium and 190 millimoles of chloride per litre.

Potassium Chloride Oral Solution

General Notices

Action and use

Used in the prevention and treatment of potassium deficiency and electrolyte imbalance.

DEFINITION

Potassium Chloride Oral Solution is a solution of Potassium Chloride in Purified Water.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Yields the reactions characteristic of *potassium salts* and the reactions characteristic of *chlorides*, Appendix VI.

Acidity or alkalinity

pH, 5.0 to 7.5, Appendix V L.

ASSAY

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, to prepare the standard solutions.

When Potassium Chloride Oral Solution for paediatric or neonatal use is prescribed or demanded, a solution containing 1 mmol/ml or 2 mmol/ml shall be dispensed or supplied.

Potassium Chloride, Sodium Chloride and Glucose Intravenous Infusion

General Notices

Potassium Chloride, Sodium Chloride and Dextrose Injection; Potassium Chloride, Sodium Chloride and Glucose Injection; Potassium Chloride, Sodium Chloride and Dextrose Intravenous Infusion

DEFINITION

Potassium Chloride, Sodium Chloride and Glucose Intravenous Infusion is a sterile solution of Potassium Chloride, Sodium Chloride and either Anhydrous Glucose or Glucose in Water for Injections.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

Content of sodium chloride, NaCl

0.17 to 0.19% w/v.

Content of glucose, $C_6H_{12}O_6$

3.8 to 4.2% w/v.

CHARACTERISTICS

A colourless or faintly straw-coloured solution.

IDENTIFICATION

A. When heated with *cupri-tartaric solution R1* a copious precipitate of copper(I) oxide is produced.

B. The residue on evaporation and ignition yields reaction B characteristic of *potassium salts*, reaction B characteristic of *sodium salts* and reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 3.5 to 6.5, Appendix V L.

5-Hydroxymethylfurfural and related substances

Dilute 25 ml to 500 ml with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

Bacterial endotoxins

The endotoxin limit concentration is 0.25 IU per ml, Appendix XIV C.

ASSAY

For potassium chloride

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, to prepare the standard solutions.

For sodium chloride

Dilute appropriately with *water* and determine by *atomic emission spectrophotometry*, Appendix II D, measuring at 589 nm and using *sodium standard solution* (*200 ppm Na*), suitably diluted with *water*, to prepare the standard solutions.

For glucose

To a quantity containing 2 to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 ml of 5M *ammonia* and sufficient *water* to produce 100 ml. Mix well, allow to stand for 30 minutes and measure the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight in g of glucose, $C_6H_{12}O_6$, in the quantity of the intravenous infusion taken for assay.

STORAGE

During storage, the separation of small solid particles from a glass container may occur. A solution containing such particles must not be used.

LABELLING

The label states (1) the content of Potassium Chloride as a percentage w/v and that the preparation contains 0.18% w/v of Sodium Chloride and 4.0% w/v of glucose, $C_6H_{12}O_6$; (2) the concentration of Potassium Chloride in grams per litre and the approximate concentration of potassium ions in millimoles per litre; (3) that the preparation contains 1.8 grams per litre of Sodium Chloride, equivalent to approximately 30 millimoles of sodium ions per litre; (4) the approximate quantity of chloride ions present, in millimoles per litre; (5) that the preparation contains 40 grams per litre of glucose, $C_6H_{12}O_6$; (6) that rapid infusion may be harmful; (7) that solutions containing visible solid particles must not be used.

Potassium Citrate Mixture

General Notices

Potassium Citrate Oral Solution

DEFINITION

Potassium Citrate Mixture is an *oral solution* containing 30% w/v of Potassium Citrate and 5% w/v of Citric Acid Monohydrate in a suitable vehicle with a lemon flavour. It is intended to be diluted with water before use.

Extemporaneous preparation

It is recently prepared according to the following formula.

Potassium Citrate	300 g
Citric Acid Monohydrate	50 g
Lemon Spirit	5 ml
Quillaia Tincture	10 ml
Syrup	250 ml
Double-strength Chloroform Water	300 ml
Water	Sufficient to produce 1000 ml

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of citric acid monohydrate, $C_6H_8O_7,H_2O$

4.75 to *5.25% w/v.*

Content of potassium citrate, $C_6H_5K_3O_7,H_2O$

28.5 to 31.5% w/v.

IDENTIFICATION

A. Yields reaction A characteristic of *potassium salts*, Appendix VI.

B. Yields reaction B characteristic of *citrates*, Appendix VI.

ASSAY

For citric acid monohydrate

To 5 ml add 100 ml of *water*, boil, cool and titrate with carbonate-free 0.1M *sodium hydroxide*

VS using *thymol blue solution* as indicator. Each ml of carbonate-free 0.1M *sodium hydroxide VS* is equivalent to 7.005 mg of $C_6H_8O_7,H_2O$.

For potassium citrate

To 1 g add 5 ml of *acetic anhydride* and 20 ml of *anhydrous acetic acid*, heat on a water bath for 20 minutes, allow to cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *1-naphtholbenzein solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 10.81 mg of $C_6H_5K_3O_7,H_2O$. Determine the *weight per ml* of the mixture, Appendix V G, and calculate the content of $C_6H_5K_3O_7,H_2O$, weight in volume.

LABELLING

The label states that the mixture should be well diluted with water before use.

The label indicates the pharmaceutical form as 'oral solution'.

Potassium Dihydrogen Phosphate Oral Solution

General Notices

Potassium Acid Phosphate Oral Solution

NOTE: There are currently no licensed formulations in the United Kingdom.

DEFINITION

Potassium Dihydrogen Phosphate Oral Solution is a 13.6% w/v solution of Potassium Dihydrogen Phosphate in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of potassium dihydrogen phosphate, KH_2PO_4

12.9 to 14.3% w/v.

IDENTIFICATION

The oral solution yields the reactions characteristic of *potassium salts* and the reactions characteristic of *phosphates,* Appendix VI.

TESTS

Acidity

pH, 3.5 to 5.0, Appendix V L.

ASSAY

Titrate 10 ml of the oral solution, saturated with *sodium chloride,* with 0.5M *sodium hydroxide VS* using *phenolphthalein solution* as indicator. Each ml of 0.5M *sodium hydroxide VS* is equivalent to 68.05 mg of KH_2PO_4.

LABELLING

The label states: (1) the strength as a percentage w/v of Potassium Dihydrogen Phosphate; (2) the approximate concentration of the potassium ions and the phosphate ions in millimoles in a suitable volume.

Potassium Hydroxide Solution

General Notices

Potash Solution

DEFINITION

Potassium Hydroxide Solution is a solution of Potassium Hydroxide in Purified Water.

Content of total alkali, calculated as KOH

4.9 to 5.1% w/v.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

Strongly alkaline and when neutralised with 2M *hydrochloric acid* yields the reactions characteristic *of potassium salts*, Appendix VI.

Weight per ml

1.040 to 1.050 g, Appendix V G.

ASSAY

Titrate 20 ml with 1M *hydrochloric acid VS* using *methyl orange solution* as indicator. Each ml of 1M *hydrochloric acid VS* is equivalent to 56.11 mg of total alkali, calculated as KOH.

STORAGE

Potassium Hydroxide Solution should be kept in a well-closed container of lead-free glass or of a suitable plastic.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

Potassium Hydroxyquinoline Sulphate and Benzoyl Peroxide Cream

General Notices

DEFINITION

Potassium Hydroxyquinoline Sulphate and Benzoyl Peroxide Cream contains Potassium Hydroxyquinoline Sulphate and Hydrous Benzoyl Peroxide in a suitable astringent basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of potassium hydroxyquinoline sulphate, $(C_9H_7NO)_2,H_2SO_4:K_2SO_4$

90.0 to 110.0% of the stated amount.

Content of anhydrous benzoyl peroxide, $C_{14}H_{10}O_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF$_{254}$* as the coating substance and a mixture of 2 volumes of *glacial acetic acid*, 4 volumes of *dichloromethane* and 100 volumes of *toluene* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) shake a quantity of the cream containing the equivalent of 50 mg of anhydrous benzoyl peroxide with 10 ml of *chloroform* and filter. Solution (2) contains 0.5% w/v of *benzoyl peroxide* in *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Add 20 ml of *methanol* to a quantity of the cream containing 10 mg of Potassium Hydroxyquinoline Sulphate, heat in a water bath, shaking occasionally, cool and filter through *anhydrous sodium sulphate*. To 10 ml of the filtrate add 5 ml of a 0.5% w/v solution of *iron*(*II*) *sulphate* in *methanol* (*70%*). A dark blue or green colour is produced immediately.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 2 volumes of solution (2) to 100 volumes with the mobile phase. For solution (2) disperse a quantity of the cream containing the equivalent of 0.10 g of anhydrous benzoyl peroxide with 25 ml of *acetonitrile* by shaking vigorously, add sufficient *water* to produce 50 ml, mix and filter. Solution (3) contains 0.020% w/v of *benzoic acid* in the mobile phase. Solution (4) contains 0.0020% w/v of *ethyl benzoate* in the mobile phase. Solution (5) contains 0.0020% w/v of *benzaldehyde* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 1 volume of *glacial acetic acid,* 500 volumes of *acetonitrile and* 500 volumes of *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a

detection wavelength of 235 nm.

In the chromatogram obtained with solution (2) the areas of any peaks corresponding to benzoic acid, ethyl benzoate and benzaldehyde are not greater than the areas of the principal peaks in the chromatograms obtained with solutions (3) (10%), (4) (1%) and (5) (1%) respectively. The area of any other *secondary peak* is not greater than half of the area of the principal peak in the chromatogram obtained with solution (1) (0.5%).

ASSAY

For potassium hydroxyquinoline sulphate

Shake vigorously a quantity of the cream containing 35 mg of Potassium Hydroxyquinoline Sulphate with 50 ml of *chloroform* and 10 ml of 13.5M *ammonia* for 5 minutes. Separate and reserve the chloroform layer and extract the aqueous layer with a further 50 ml of *chloroform*. Extract the combined chloroform layers with two 50 ml quantities of 3.5M *hydrochloric acid*, combine the extracts, wash gently with three 50 ml quantities of *chloroform* and discard the chloroform layers. Add 50 ml of 0.01M *bromine VS*, stopper the flask, shake for 20 minutes and allow to stand for 20 minutes. Add 10 ml of *dilute potassium iodide solution* and titrate with 0.02M *sodium thiosulphate VS* using *starch solution*, added towards the end of the titration, as indicator. Repeat the titration using 100 ml of 3.5M *hydrochloric acid* and beginning at the words 'Add 50 ml...'. The difference between the titrations represents the amount of bromine required. Each ml of 0.01M *bromine VS* is equivalent to 1.407 mg of $(C_9H_7NO)_2,H_2SO_4{:}K_2SO_4$.

For benzoyl peroxide

Shake gently a quantity of the cream containing the equivalent of 0.4 g of anhydrous benzoyl peroxide with 50 ml of *chloroform* until the cream has dispersed and filter the lower layer excluding any solid matter that separates at the interface. Repeat the extraction with two further 50 ml quantities of *chloroform*, wash the filter with *chloroform*, combine the extracts and washings and dilute to 250 ml with *chloroform*. To 25 ml of the chloroform extract add 40 ml of a 0.0005% w/v solution of *iron(III) chloride hexahydrate* in *glacial acetic acid* and 10 ml of *dilute potassium iodide solution* and shake for 20 minutes protected from light. Add 60 ml of *water* and titrate with 0.0125M *sodium thiosulphate VS* using *starch solution*, added towards the end of the titration, as indicator. Repeat the titration using 25 ml of *chloroform* in place of the chloroform extract. The difference between the titrations represents the amount of sodium thiosulphate required. Each ml of 0.0125M *sodium thiosulphate VS* is equivalent to 1.514 mg of $C_{14}H_{10}O_4$.

LABELLING

The content of Hydrous Benzoyl Peroxide is stated in terms of the equivalent amount of anhydrous benzoyl peroxide.

Potassium Iodate Tablets

General Notices

DEFINITION

Potassium Iodate Tablets contain Potassium Iodate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of potassium iodate, KIO_3

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.4 g of Potassium Iodate with 10 ml of *water* and filter (solution A). 1 ml of solution A yields reaction B characteristic of *potassium salts*, Appendix VI.

B. Add 1 g of *potassium iodide* and 1 ml of *hydrochloric acid* to 5 ml of solution A and shake. A brown colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of *water* and rotating the basket at 100 revolutions per minute. Filter the medium after first wetting the filter paper with *water* and note the volume of filtrate. Treat the filtrate as described under Assay beginning at the words 'To 50 ml of the filtrate ...'. Repeat the assay procedure without the dissolution medium. Calculate the total content of potassium iodate, KIO_3, in the dissolution medium from the difference between the titrations.

Iodide

Shake a quantity of the powdered tablets containing 2.5 g of Potassium Iodate with 50 ml *water* and filter (solution B). Add 1 ml of 1.8M *sulphuric acid* and 1 ml of *chloroform* to 25 ml of solution B and shake. Any violet colour produced is not more intense than that of a solution prepared at the same time and in the same manner but using 5 ml of solution B and 2 ml of *iodide standard solution (10 ppm I)* (20 ppm).

ASSAY

Weigh and powder 20 tablets. Transfer a quantity of the powdered tablets containing 0.3 g of Potassium Iodate to an iodine flask, add 100 ml of *water*, shake and filter. To 50 ml of the filtrate add 3 g of *potassium iodide* followed by 50 ml of 2M *hydrochloric acid*. Stopper the flask, mix and stand in the dark for 5 minutes. Titrate the resulting solution with 0.1M *sodium thiosulphate VS* to a light straw colour and then complete the titration to a colourless end point using *starch solution* as indicator. Repeat the titration without the powdered tablets. The difference between the titrations represents the amount of sodium thiosulphate required. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 3.567 mg of KIO_3.

Povidone-Iodine Mouthwash

General Notices

Action and use

Disinfectant.

DEFINITION

Povidone-Iodine Mouthwash is either an aqueous solution of Iodinated Povidone or it is prepared by the interaction between Iodine and Povidone.

The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of available iodine, I

0.085 to 0.120% w/v.

CHARACTERISTICS

A yellowish-brown solution.

IDENTIFICATION

A. Dilute 1 ml to 2 ml with *water* and add 1 ml of the resulting solution to a mixture of 1 ml of *starch mucilage* and 9 ml of *water*. A deep blue colour is produced.

B. Transfer 10 ml to a small flask and cover the mouth of the flask with filter paper moistened with 0.05 ml of *starch mucilage*. No blue colour is produced on the paper within 60 seconds.

C. To 10 ml add drop wise 0.1M *sodium thiosulphate* until the colour of the iodine is just discharged. To 5 ml of the solution add 10 ml of 1M *hydrochloric acid* and 5 ml of a 7.0% w/v solution of *potassium dichromate*. A red precipitate is produced.

D. To 5 ml add 2 ml of *ammonium cobaltothiocyanate solution* previously acidified with 5M *hydrochloric acid*. A blue precipitate is produced.

TESTS

Acidity

pH, 3.0 to 6.5, Appendix V L.

Iodide

Not more than 0.06% w/v when determined by the following method. To 50 ml of the mouthwash add *sodium metabisulphite* until the colour of iodine has disappeared. Add 25 ml of 0.1M *silver nitrate VS*, 10 ml of *nitric acid* and 5 ml of *ferric ammonium sulphate solution R2*. Titrate with 0.1M *ammonium thiocyanate VS*. Repeat the procedure without the solution being examined. Each ml of 0.1M *silver nitrate VS* is equivalent to 12.69 mg of total iodine.

Calculate the percentage content of total iodine and subtract the percentage content of available iodine determined in the Assay to obtain the percentage content of iodide.

ASSAY

To 100 ml add 10 ml of 0.1M *hydrochloric acid* and sufficient *water* to produce 150 ml and titrate with 0.1M *sodium thiosulphate VS* determining the end point potentiometrically. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 12.690 mg of I.

Povidone-Iodine Solution

General Notices

Action and use

Disinfectant.

DEFINITION

Povidone-Iodine Solution is either an aqueous solution of Iodinated Povidone or it is prepared by the interaction between Iodine and Povidone. It is a *cutaneous solution.*

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of available iodine, I

0.85 to 1.20% w/v.

CHARACTERISTICS

A deep brown liquid.

IDENTIFICATION

A. Dilute 1 ml to 20 ml with *water* and add 1 ml of the resulting solution to a mixture of 1 ml of *starch mucilage* and 9 ml of *water*. A deep blue colour is produced.

B. Transfer 10 ml to a small flask and cover the mouth of the flask with filter paper moistened with 0.05 ml of *starch mucilage*. No blue colour is produced on the paper within 60 seconds.

C. Dilute 20 ml to 100 ml with *water*. To 10 ml add drop wise 0.1M *sodium thiosulphate* until the colour of the iodine is just discharged. Reserve 5 ml of the resulting solution for test D. To 5 ml of the solution add 10 ml of 1M *hydrochloric acid* and 5 ml of a 7.0% w/v solution of *potassium dichromate*. A red precipitate is produced.

D. To 5 ml of the solution reserved in test C add 2 ml of *ammonium cobaltothiocyanate solution* previously acidified with 5M *hydrochloric acid*. A blue precipitate is produced.

TESTS

Acidity

pH, 3.0 to 6.5, Appendix V L.

Iodide

Not more than 0.6% w/v when determined by the following method. Dilute 5 ml of the solution being examined to 100 ml with *water* and add *sodium metabisulphite* until the colour of iodine has disappeared. Add 25 ml of 0.1M *silver nitrate VS*, 10 ml of *nitric acid* and 5 ml of *ferric ammonium sulphate solution R2*. Titrate with 0.1M *ammonium thiocyanate VS*. Repeat the procedure without the solution being examined. Each ml of 0.1M *silver nitrate VS* is equivalent to 12.69 mg of total iodine. Calculate the percentage content of total iodine and subtract the percentage content of available iodine determined in the Assay to obtain the percentage content of iodide.

ASSAY

To 10 ml add 10 ml of 0.1M *hydrochloric acid* and sufficient *water* to produce 150 ml and titrate with 0.02M *sodium thiosulphate VS* determining the end point potentiometrically. Each ml of 0.02M *sodium thiosulphate VS* is equivalent to 2.538 mg of I.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

The label states the pharmaceutical form as 'cutaneous solution'.

Pravastatin Tablets

General Notices

Action and use

HMG Co-A reductase inhibitor; lipid-regulating drug.

DEFINITION

Pravastatin Tablets contain Pravastatin Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pravastatin sodium, $C_{23}H_{35}NaO_7$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 10 mg of Pravastatin Sodium with 80 ml of *water* for 10 minutes, dilute to 100 ml with *water*, filter and dilute 1 ml to 10 ml with *water*. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 350 nm, exhibits a maximum only at 238 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Dissolve 4.10 g of *anhydrous sodium acetate* in 400 ml of *water*, adjust the pH to 5.6 with *glacial acetic acid* and add sufficient *water* to produce 500 ml (solution A). Mix 20 volumes of *methanol* with 80 volumes of solution A (solution B). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of solution A to a quantity of the powdered tablets containing 10 mg of Pravastatin Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes. Centrifuge and dilute 1 volume of the clear supernatant liquid to 5 volumes with solution B. For solution (2) dilute 1 volume of solution (1) to 100 volumes with solution B. For solution (3) dilute 1 volume of solution (2) to 5 volumes with solution B. For solution (4) dilute 1 volume of solution (3) to 4 volumes with solution B. For solution (5) dissolve 2 mg of *pravastatin impurity A EPCRS* in the minimum volume of *methanol* and dilute to 20 ml with solution (1). Inject 20 µl of each solution.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Ultrasphere ODS is suitable) maintained at 25°, (b) as the mobile phase with a flow rate of 1.3 ml per minute a mixture of 1 volume of *glacial acetic acid*, 1 volume of *triethylamine*, 450 volumes of *methanol* and 550 volumes of *water* and (c) a detection wavelength of 238 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution*

factor between the peaks corresponding to pravastatin impurity A and pravastatin is at least 7.0.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%), not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%), not more than a further one such peak has an area greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%) and the sum of the areas of all such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Weigh and powder 20 tablets. Dissolve 4.10 g of *anhydrous sodium acetate* in 400 ml of *water*, adjust the pH to 5.6 with *glacial acetic acid* and add sufficient *water* to produce 500 ml (solution A). Mix 20 volumes of *methanol* with 80 volumes of solution A (solution B). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 ml of solution A to a quantity of the powdered tablets containing 10 mg of Pravastatin Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes. Centrifuge and dilute 1 volume of the clear supernatant liquid to 5 volumes with solution B. For solution (2) dissolve 12.4 mg of *pravastatin 1,1,3,3,-tetramethylbutylamine EPCRS* in 20 ml of solution A and dilute 1 volume to 5 volumes with solution B. For solution (3) dissolve 2 mg of *pravastatin impurity A EPCRS* in the minimum volume of *methanol* and dilute to 20 ml with solution (1).

The chromatographic conditions described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to pravastatin impurity A and pravastatin is at least 7.0.

Calculate the content of $C_{23}H_{35}NaO_7$ in the tablets using the declared content of $C_{23}H_{36}O_7$ in *pravastatin 1,1,3,3,-tetramethylbutylamine EPCRS*. Each mg of $C_{23}H_{36}O_7$ is equivalent to 1.052 mg of $C_{23}H_{35}NaO_7$.

STORAGE

Pravastatin Tablets should be protected from light and moisture.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Pravastatin Sodium.

Prazosin Tablets

General Notices

Action and use

Alpha$_1$-adrenoceptor antagonist.

DEFINITION

Prazosin Tablets contain Prazosin Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of prazosin, $C_{19}H_{21}N_5O_4$

90.0 to 110% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing the equivalent of 10 mg of prazosin with a mixture of 10 ml of *dichloromethane* and 10 ml of 0.05M *potassium hydroxide*, filter the organic layer through absorbent cotton, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 2 kPa for 2 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of prazosin (*RS 281*).

TESTS

Uniformity of content

Tablets containing less than the equivalent of 2 mg of prazosin comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water*. Solution (1) contains 0.00220% w/v of *prazosin hydrochloride BPCRS*. For solution (2) shake one tablet for 1 hour in a suitable volume of the solvent to produce a solution containing the equivalent of 0.002% w/v of prazosin, centrifuge and use the supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4 mm) packed with *silica gel for chromatography* (5 µm) (Zorbax Sil is suitable), (b) 0.01% w/v of *diethylamine* in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{19}H_{21}N_5O_4$ using the declared content of $C_{19}H_{21}N_5O_4$ in *prazosin hydrochloride BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel GF$_{254}$ precoated plate (Analtech Uniplates are suitable) and a mixture of 95 volumes of *ethyl acetate* and 5 volumes of *diethylamine* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 5 mg of prazosin with 2 ml of a mixture of 95 volumes of *chloroform* and 5 volumes of *diethylamine*, centrifuge and pass the supernatant liquid through a 0.5 µm PTFE filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent. For solution (3) dilute 2 volumes of solution (2) to 5 volumes with the same solvent. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water*. Solution (1) contains 0.00220% of *prazosin hydrochloride BPCRS*. For solution (2) shake a quantity of the powdered tablets containing the equivalent of 2 mg of prazosin with 100 ml of the solvent mixture for 30 minutes, centrifuge and use the supernatant liquid.

The chromatographic procedure described under Uniformity of content may be used.

Calculate the content of $C_{19}H_{21}N_5O_4$ using the declared content of $C_{19}H_{21}N_5O_4$ in *prazosin hydrochloride BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of prazosin.

Prednisolone Enema

General Notices

Action and use

Glucocorticoid.

DEFINITION

Prednisolone Enema is a *rectal solution* containing Prednisolone Sodium Phophate in Purified Water. It contains suitable buffering and stabilising agents and a suitable antimicrobial preservative.

The enema complies with the requirements stated under Rectal Preparations and with the following requirements.

Content of prednisolone, $C_{21}H_{28}O_5$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak having the same retention time as the peak due to prednisolone sodium phosphate in the chromatogram obtained with solution (2).

B. Evaporate 5 ml to dryness on a water bath, cool and dissolve the residue in 0.5 ml of *sulphuric acid* . A dark red colour is produced.

TESTS

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Free prednisolone

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of equal volumes of *acetone* and *toluene* as the mobile phase. Apply separately to the plate 25 µl of each of the following solutions. For solution (1) dilute a volume of the enema containing the equivalent of 2.0 mg of prednisolone with sufficient *water* to produce 25 ml, add 2.5 g of *sodium chloride* and 1 ml of *hydrochloric acid*, extract with three 25-ml quantities of *chloroform* and wash each extract with the same 1 ml quantity of 0.1M *hydrochloric acid* in a second separating funnel. Evaporate the combined chloroform extracts to about 5 ml using a rotary evaporator, transfer to a 15 ml stoppered tube and rinse the rotary evaporator flask with a few millilitres of *chloroform*, adding the rinsings to the tube. Evaporate in a gentle current of nitrogen and dissolve the residue in 1 ml of *chloroform*. Solution (2) contains 0.0134% w/v of *prednisolone BPCRS* in *chloroform*. After removal of the plate, allow it to dry and examine under *ultraviolet light* (*254 nm*). Any spot in the chromatogram obtained with solution (1) corresponding to prednisolone is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute, if necessary, a quantity of the enema containing the equivalent of 2 mg of prednisolone to 10 ml with *water*, add 10 ml of *water*, extract with three 20-ml quantities of *chloroform* and discard the lower layer. For solution (2) dissolve 55 mg of *prednisolone sodium phosphate BPCRS* in *water* and dilute to 200 ml (solution A); to 10 ml of solution A add 10 ml of a 0.035% w/v solution of *betamethasone sodium phosphate* in *water* (internal standard), extract with three 20 ml quantities of *chloroform* and discard the lower layer. Prepare solution (3) in the same manner as solution (1) but add 10 ml of a 0.035% w/v solution of *betamethasone sodium phosphate* in *water* in place of the 10 ml of water.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable) and maintained at 60°, (b) a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 247 nm.

Calculate the content of $C_{21}H_{28}O_5$ in solution A by measuring the *absorbance*, Appendix II B, of a solution obtained by diluting 1 volume of solution A to 10 volumes with *water* at the maximum at 247 nm and taking 419 as the value of A(1%, 1 cm) at the maximum at 247 nm. Calculate the content of $C_{21}H_{28}O_5$ in the enema using peak areas.

STORAGE

Prednisolone Enema should be protected from light.

LABELLING

The content of Prednisolone Sodium Phosphate is stated in terms of the equivalent amount of prednisolone.

The label states (1) the date after which the enema is not intended to be used; (2) the conditions under which it should be stored.

Prednisolone Sodium Phosphate Ear Drops

General Notices

Action and use

Glucocorticoid.

DEFINITION

Prednisolone Sodium Phosphate Ear Drops are a solution of Prednisolone Sodium Phosphate in Purified Water.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of prednisolone sodium phosphate, $C_{21}H_{27}Na_2O_8P$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

For ear drops containing less than 0.1% w/v of Prednisolone Sodium Phosphate carry out test B only.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the ear drops diluted, if necessary, with *water* to contain 0.1% w/v of Prednisolone Sodium Phosphate.

(2) 0.1% w/v of *prednisolone sodium phosphate BPCRS.*

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (2) and a 0.1% w/v solution of *betamethasone sodium phosphate BPCRS.*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, heat at 110° for 10 minutes and examine under *ultraviolet light* (*254 nm*).

MOBILE PHASE

33 volumes of *water,* 47 volumes of *glacial acetic acid* and 120 volumes of *butan-1-ol*, prepared immediately before use.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two principal spots with almost identical Rf values.

CONFIRMATION

The chromatograms obtained with solutions (1), (2) and (3) show single principal spots with similar Rf values.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to prednisolone sodium phosphate in the chromatogram obtained with solution (2).

C. To a volume containing 0.2 mg of Prednisolone Sodium Phosphate slowly add 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A deep red colour is produced.

TESTS

Acidity or alkalinity

pH, 7.0 to 8.5, Appendix V L.

Free Prednisolone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) 0.00004% w/v of *prednisolone BPCRS* in the mobile phase.

(2) Dilute the ear drops, if necessary, with the mobile phase to produce a solution containing 0.010% w/v of Prednisolone Sodium Phosphate.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 247 nm.

(f) Inject 0.2 ml of each solution.

MOBILE PHASE

45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0.*

LIMITS

In the chromatogram obtained with solution (2) the area of any peak corresponding to prednisolone is not greater than the area of the principal peak in the chromatogram obtained with solution (1) (4%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a quantity of the ear drops with *water*, if necessary, to contain 0.001% w/v of

Prednisolone Sodium Phosphate.

(2) 0.0025% w/v of *prednisolone sodium phosphate BPCRS.*

(3) 0.001% w/v of *prednisolone sodium phosphate BPCRS.*

(4) 0.001% w/v of *each of prednisolone sodium phosphate BPCRS* and *betamethasone sodium phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 247 nm.

(f) Inject 50 µl of each solution.

MOBILE PHASE

45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0.*

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to betamethasone sodium phosphate and prednisolone sodium phosphate is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{27}Na_2O_8P$ in solution (2) by measuring the *absorbance*, Appendix II B, of solution (2) at the maximum at 247 nm and taking 312 as the value of A(1%, 1 cm) at the maximum at 247 nm. Calculate the content of $C_{21}H_{27}Na_2O_8P$ in the ear drops using the calculated content of $C_{21}H_{27}Na_2O_8P$ in *prednisolone sodium phosphate BPCRS*.

STORAGE

Prednisolone Sodium Phosphate Ear Drops should be stored protected from light.

Prednisolone Sodium Phosphate Eye Drops

General Notices

Action and use

Glucocorticoid.

DEFINITION

Prednisolone Sodium Phosphate Eye Drops are a sterile solution of Prednisolone Sodium Phosphate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of prednisolone sodium phosphate, $C_{21}H_{27}Na_2O_8P$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

For eye drops containing less than 0.1% w/v of Prednisolone Sodium Phosphate carry out test B only.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 33 volumes of *water,* 47 volumes of *glacial acetic acid* and 120 volumes of *butan-1-ol*, prepared immediately before use, as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) use the eye drops diluted, if necessary, with *water* to contain 0.1% w/v of Prednisolone Sodium Phosphate. Solution (2) contains 0.1% w/v of *prednisolone sodium phosphate BPCRS* in *water*. Solution (3) is a mixture of equal volumes of solutions (1) and (2). Solution (4) is a mixture of equal volumes of solution (2) and a 0.1% w/v solution of *betamethasone sodium phosphate BPCRS* in *water*. After removal of the plate, allow it to dry in air, heat at 110° for 10 minutes and examine under *ultraviolet light* (*254 nm*). The chromatograms obtained with solutions (1), (2) and (3) show single principal spots with similar Rf values. The chromatogram obtained with solution (4) shows two principal spots with almost identical Rf values.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to prednisolone sodium phosphate in the chromatogram obtained with solution (2).

C. To a volume containing 0.2 mg of Prednisolone Sodium Phosphate slowly add 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A deep red colour is produced.

TESTS

Acidity or alkalinity

pH, 7.0 to 8.5, Appendix V L.

Free prednisolone

Carry out the method for *liquid chromatography*, Appendix III D. For eye drops containing 0.010% w/v or more of Prednisolone Sodium Phosphate use 50 µl of the following solutions. Solution (1) contains 0.00040% w/v of *prednisolone BPCRS* in the mobile phase. Prepare solution (2) in the following manner. Dilute the eye drops, if necessary, with the mobile phase to produce a solution containing 0.010% w/v of Prednisolone Sodium Phosphate.

For eye drops containing less than 0.010% w/v of Prednisolone Sodium Phosphate, use 0.2 ml of the following solutions. Solution (1) contains 0.00004% w/v of *prednisolone BPCRS* in the mobile phase. For solution (2) dilute the eye drops, if necessary, with the mobile phase to produce a solution containing 0.0010% w/v of Prednisolone Sodium Phosphate.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 247 nm.

In the chromatogram obtained with solution (2) the area of any peak corresponding to prednisolone is not greater than the area of the principal peak in the chromatogram obtained with solution (1) (4%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using 50 µl of the following solutions. For solution (1) dilute a quantity of the eye drops, if necessary, to contain 0.001% w/v of Prednisolone Sodium Phosphate. For solution (2) dissolve 10 mg of *prednisolone sodium phosphate BPCRS* in sufficient *water* to produce 100 ml (solution A) and dilute 10 ml of the solution to 100 ml. For solution (3) add 10 ml of a 0.01% w/v solution of *betamethasone sodium phosphate BPCRS* in *water* to 10 ml of solution A and dilute to 100 ml with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 247 nm.

The assay is not valid unless the *resolution factor* between the peaks due to betamethasone sodium phosphate and prednisolone sodium phosphate in the chromatogram obtained with solution (3) is at least 2.5.

Calculate the content of $C_{21}H_{27}Na_2O_8P$ in solution A by measuring the *absorbance*, Appendix II B, of a solution obtained by diluting 1 volume of solution A to 4 volumes with *water* at the maximum at 247 nm and taking 312 as the value of A(1%, 1 cm) at the maximum at 247 nm. Calculate the content of $C_{21}H_{27}Na_2O_8P$ in the eye drops using peak areas.

STORAGE

Prednisolone Sodium Phosphate Eye Drops should be stored protected from light.

Prednisolone Tablets

General Notices

Action and use

Glucocorticoid.

DEFINITION

Prednisolone Tablets contain Prednisolone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of prednisolone, $C_{21}H_{28}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets with *acetone*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of prednisolone (*RS 282*).

B. Complies with the test for the Identification of steroids, Appendix III A, using *impregnating solvent I* and *mobile phase A*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *water* and rotate the paddle at 50 revolutions per minute.

Carry out the method for *liquid chromatography*, Appendix III D, injecting 0.2 ml of each of the following solutions. For solution (1) prepare a 0.1% w/v solution of *prednisolone BPCRS* in *methanol* and dilute with *water* to contain 0.0001% w/v. For solution (2) use the dissolution medium diluted, if necessary, with *water* to contain 0.0001% w/v of prednisolone.

The chromatographic procedure described under Uniformity of content may be used.

The test is not valid unless the *column efficiency*, determined using the peak due to prednisolone in the chromatogram obtained with solution (1), is greater than 15,000 theoretical plates per metre.

Calculate the total content of $C_{21}H_{28}O_5$ in the medium using the declared content of $C_{21}H_{28}O_5$ in *prednisolone BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 10 mg of Prednisolone with 25 ml of *methanol* for 10 minutes and mix with the aid of ultrasound for 2 minutes; filter the extract (Whatman GF/F is suitable), wash the filter with two 10 ml quantities of *methanol*, combine the filtrate and washings and evaporate to dryness using a rotary evaporator and a warm water bath; dissolve the residue in 10 ml of *tetrahydrofuran* and dilute to 20 ml with *water*. Solution (2) contains 0.002% w/v each of *prednisolone BPCRS* and *hydrocortisone BPCRS* in the mobile phase. For solution (3) dilute 1 volume of solution (1) to 100 volumes with a 50% v/v solution of *tetrahydrofuran*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Alltima C18 is suitable) and maintained at 45°, (b) as mobile phase at a flow rate of 1 ml per minute a mixture prepared as follows: mix 220 volumes of *tetrahydrofuran* with 700 volumes of *water*, allow to equilibrate, dilute to 1000 volumes with *water* and mix and (c) a detection wavelength of 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml per minute for about 30 minutes. Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with solution (3) is at least 50% of the full scale of the recorder.

Inject 20 µl of solution (2). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisolone about 14 minutes and hydrocortisone about 15.5 minutes. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject separately 20 µl of the solvent mixture of solution (1) as a blank, 20 µl of solution (1) and of solution (3). Continue the chromatography for 4.5 times the retention time of the principal peak.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%) and the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with solution (3) (3%). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%) and any peak with a retention time of 3 minutes or less.

Uniformity of content

Tablets containing less than 2 mg of Prednisolone comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0050% w/v of *prednisolone BPCRS* and 0.0075% w/v of *dexamethasone* (internal standard) in the mobile phase. For solution (2) add 20 ml of the mobile phase to one tablet, mix with the aid of ultrasound for at least 10 minutes, mix thoroughly, centrifuge and use the supernatant liquid. Prepare solution (3) in the same manner as solution (2) but using a 0.0075% w/v solution of the internal standard in the mobile phase in place of the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 58 volumes of *methanol* and 42 volumes of *water* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 254 nm.

The test is not valid unless the *resolution factor* between the peaks due to prednisolone and dexamethasone is greater than 2.5 and the *column efficiency*, determined using the peak due to prednisolone in the chromatogram obtained with solution (1), is greater than 15,000 theoretical plates per metre.

Calculate the content of $C_{21}H_{28}O_5$ using the declared content of $C_{21}H_{28}O_5$ in *prednisolone BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.005% w/v of *prednisolone BPCRS* and 0.0075% w/v of *dexamethasone* (internal standard) in a mixture of 58 volumes of *methanol* and 42 volumes of *water*. For solution (2) add 58 ml of *methanol* to a quantity of the powder containing 5 mg of Prednisolone, shake for 10 minutes, add sufficient *water* to produce 100 ml, mix and filter. Prepare solution (3) in the same manner as solution (2) but add 10 ml of a 0.075% w/v solution of *dexamethasone* in *methanol* and 48 ml of *methanol* in place of the 58 ml of methanol.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 42 volumes of *water* and 58 volumes of *methanol* as the mobile phase with a flow rate of about 1 ml per minute and (c) a detection wavelength of 254 nm.

The assay is not valid unless the *resolution factor* between the peaks due to prednisolone and dexamethasone is greater than 2.5 and the *column efficiency*, determined using the peak due to prednisolone in the chromatogram obtained with solution (1), is greater than 15,000 *theoretical plates* per metre.

Calculate the content of $C_{21}H_{28}O_5$ in the tablets using the declared content of $C_{21}H_{28}O_5$ in *prednisolone BPCRS*.

STORAGE

Prednisolone Tablets should be protected from light.

Prilocaine Injection

General Notices

Action and use

Local anaesthetic.

DEFINITION

Prilocaine Injection is a sterile solution of Prilocaine Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of prilocaine hydrochloride, $C_{13}H_{20}N_2O,HCl$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. To a volume containing 0.1 g of Prilocaine Hydrochloride add 2M *sodium hydroxide* until the solution is about pH 11. Add 20 ml of *ethyl acetate*, shake, allow the layers to separate, dry the organic layer over *anhydrous calcium chloride* at a pressure of 2 kPa, filter and evaporate the filtrate to dryness under reduced pressure. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of prilocaine (*RS 284*).

B. In the Assay, the principal peak in the chromatogram obtained with solution (3) has the same retention time as the peak due to prilocaine in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 5.0 to 7.0, Appendix V L.

Aromatic amines

To 1 ml of the injection, diluted if necessary to contain 0.05% w/v of Prilocaine Hydrochloride, add 1 ml of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 ml of *glacial acetic acid*. Shake and allow to stand for 10 minutes. Measure the *absorbance* of the solution at 430 nm, Appendix II B, using *water* in the reference cell. The absorbance is not more intense than that produced in a solution prepared at the same time and in the same manner but using 1 ml of a solution in *water* containing 5 µg per ml of o-*toluidine hydrochloride* (0.75%, calculated as *o*-toluidine).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.01% w/v of *prilocaine hydrochloride BPCRS* in the mobile phase. For solution (2) dilute the injection with the mobile phase to produce a solution containing 0.01% w/v of Prilocaine Hydrochloride.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) a mixture of 30 volumes of 0.05M *mixed phosphate buffer pH 8* and 70 volumes of *methanol* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{13}H_{20}N_2O,HCl$ in the injection using the declared content of $C_{13}H_{20}N_2O,HCl$ in *prilocaine hydrochloride BPCRS*.

Procainamide Tablets

General Notices

Action and use

Class I antiarrhythmic.

DEFINITION

Procainamide Tablets contain Procainamide Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of procainamide hydrochloride, $C_{13}H_{21}N_3O,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.25 g of Procainamide Hydrochloride with 25 ml of *water*, make alkaline with 5M *sodium hydroxide* and extract with two 5 ml quantities of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate*, evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 5 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of procainamide (*RS 288*).

B. Triturate a quantity of the powdered tablets containing 2 g of Procainamide Hydrochloride with 20 ml of *water* and filter. Reserve 10 ml of the filtrate for test C. To the remainder add 10 ml of 5M *sodium hydroxide* and extract with 10 ml of *chloroform*. Add 10 ml of *toluene* to the extract, dry over *anhydrous sodium sulphate* and filter. Mix the filtrate with 5 ml of dry *pyridine*, add 1 ml of *benzoyl chloride* drop wise, heat on a water bath for 30 minutes and pour into 100 ml of 2.5M *sodium hydroxide*. Extract with 10 ml of *ether*, wash the extract with 20 ml of *water*, dilute with 30 ml of *ether* and allow to crystallise. The *melting point* of the crystals, after recrystallisation from *ethanol* (*45%*), is about 186°, Appendix V A.

C. 10 ml of the filtrate reserved in test B yields the reactions characteristic of *chlorides*, Appendix VI.

Related substances

Comply with the test described under Procainamide Injection using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.4 g of Procainamide Hydrochloride with 20 ml of *methanol* (*90%*) for 15 minutes and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.5 g of Procainamide Hydrochloride in a stoppered flask add 100 ml of 6M *hydrochloric acid*, shake for 15 minutes and titrate with 0.1M *sodium nitrite VS*, using *ferrocyphen solution* as indicator, until a violet colour is produced that is stable for not less than 3 minutes. Repeat the operation without the powdered tablets. The difference between the titrations represents the amount of sodium nitrite required. Each ml of 0.1M *sodium nitrite VS* is equivalent to 27.18 mg of $C_{13}H_{21}N_3O$, HCl.

Prochlorperazine Buccal Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Prochlorperazine Buccal Tablets contain Prochlorperazine Maleate in a suitable basis.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of prochlorperazine maleate, $C_{20}H_{24}ClN_3S,2C_4H_4O_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 24 mg of Prochlorperazine Maleate add 10 ml of *water* and 1 ml of 1M *sodium hydroxide*, shake, extract with 25 ml of *dichloromethane* and evaporate to dryness. The *infrared absorption spectrum* of a thin film of the residue, Appendix II A, is concordant with the *reference spectrum* of prochlorperazine (*RS 390*).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 10 volumes of *acetone*, 10 volumes of *diethylamine*, and 80 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 60 mg of Prochlorperazine Maleate with 5 ml of 0.18M *methanolic ammonia*, shake for 15 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 0.006% w/v of *prochlorperazine maleate BPCRS* in 0.18M *methanolic ammonia*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Weigh and finely powder 20 tablets. To a quantity of the powdered tablets containing 10 mg of Prochlorperazine Maleate add 50 ml of 1M *methanesulphonic acid*, shake for 5 minutes and disperse with the aid of ultrasound for 2 minutes. Add sufficient 1M *methanesulphonic acid* to produce 100 ml, mix, centrifuge the mixture and dilute 10 ml of the supernatant liquid to 100 ml with *water*. Measure the *absorbance* of the resulting solution at 254 nm, Appendix II B, using 0.1M *methanesulphonic acid* in the reference cell. Measure the *absorbance* of a solution prepared by diluting 1 volume of a 0.01% w/v solution of *prochlorperazine maleate BPCRS* in 1M *methanesulphonic acid* to 10 volumes with *water* using 0.1M *methanesulphonic acid* in the reference cell. Calculate the content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ from the absorbances obtained and from the declared content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ in *prochlorperazine maleate BPCRS*.

STORAGE

Prochlorperazine Buccal Tablets should be protected from light.

Prochlorperazine Injection

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Prochlorperazine Injection is a sterile solution of Prochlorperazine Mesilate in Water for Injections free from dissolved air.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of prochlorperazine mesilate, $C_{20}H_{24}ClN_3S,2CH_4SO_3$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. To a volume containing 0.1 g of Prochlorperazine Mesilate add 20 ml of *water* and 2 ml of 10M *sodium hydroxide*. Shake and extract the mixture with 25 ml of *ether*. Wash the ether layer with two 5 ml quantities of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of prochlorperazine (*RS 289*).

B. To a volume containing 5 mg of Prochlorperazine Mesilate add carefully 2 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

C. To a volume containing 0.2 g of Prochlorperazine Mesilate add 1.5 ml of 5M *sodium hydroxide* and extract with 10 ml of *ether*. Wash the ether layer with two 5 ml quantities of *water*, evaporate the ether layer to dryness, dissolve the residue in 10 ml of *methanol* and add a solution of 0.3 g of *picric acid* in a mixture of 5 ml of *methanol* and 5 ml of *water*. The *melting point* of the precipitate, after washing with 15 ml of *methanol*, is about 255°, with decomposition, Appendix V A.

TESTS

Acidity

pH, 5.5 to 6.5, Appendix V L.

Related substances

Carry out the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and the following solutions. For solution (1) use the injection being examined. For solution (2) dilute 1 volume of solution (1) to 40 volumes with *methanol* containing 0.5% v/v of 13.5M *ammonia* immediately before use. For solution (3) dilute 1 volume of solution (1) to 200 volumes with the methanol–ammonia mixture immediately before use. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) (2.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the following procedure protected from light. To a quantity containing 12.5 mg of Prochlorperazine Mesilate add sufficient *absolute ethanol* containing 0.01% v/v of 13.5M *ammonia* to produce 100 ml. Dilute 5 ml of the solution to 100 ml with the ammoniacal ethanol and measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{20}H_{24}ClN_3S,2CH_4SO_3$ taking 635 as the value of A(1%, 1 cm) at the maximum at 258 nm.

STORAGE

Prochlorperazine Injection should be protected from light.

Prochlorperazine Oral Solution

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Prochlorperazine Oral Solution contains Prochlorperazine Mesilate in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of prochlorperazine mesilate, $C_{20}H_{24}ClN_3S,2CH_4SO_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume of the oral solution containing 50 mg of Prochlorperazine Mesilate add 50 ml of *water* and 2 ml of 10M *sodium hydroxide*, add *sodium chloride* and extract with two 50 ml quantities of *ether*. Wash the combined ether extracts with two 5 ml quantities of *water*, filter through *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 10 ml of *methanol* and add a solution prepared by dissolving 0.1 g of *picric acid* in a mixture of 5 ml of *methanol* and 5 ml of *water*, wash the resulting precipitate with 15 ml of *methanol* and dry at 100° for 40 minutes. The *melting point* of the dried precipitate is about 255°, with decomposition, Appendix V A.

B. In the test for Prochlorperazine sulphoxide, the principal spot in the chromatogram obtained with solution (2) is similar in position, size and intensity to that in the chromatogram obtained with solution (3).

Prochlorperazine sulphoxide

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light, using a precoated silica gel F_{254} plate activated by drying at 105° for 1 hour and a mixture of 5 volumes of *diethylamine*, 45 volumes of *acetone* and 50 volumes of *hexane* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) mix a quantity of the oral solution containing 10 mg of Prochlorperazine Mesilate with 35 ml of *water* and 5 ml of a 20% w/v solution of *sodium hydroxide*, extract with four 40 ml quantities of *chloroform*, shaking for 2 minutes each time, and filter each extract through *anhydrous sodium sulphate* washing the sodium sulphate with 5 ml of *chloroform*. Evaporate the combined chloroform extracts and washings to dryness at 30° under reduced pressure using a current of *nitrogen* to remove the last of the solvent and dissolve the residue in 1 ml of a mixture of equal volumes of *chloroform* and *methanol*. For solution (2) dilute 1 volume of solution (1) to 10 volumes with a mixture of equal volumes of *chloroform* and *methanol*. Solution (3) contains 0.1% w/v of *prochlorperazine mesilate BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*. Solution (4) contains 0.03% w/v of *prochlorperazine sulphoxide BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any spot corresponding to prochlorperazine sulphoxide in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (3%).

ASSAY

Carry out the following procedure protected from light. To a weighed quantity containing 10 mg of Prochlorperazine Mesilate add 25 ml of *water* and 5 ml of a 10% w/v solution of *sodium hydroxide*. Extract the mixture with three 50 ml quantities of *chloroform*, shaking vigorously for 1 minute, allowing to separate and shaking vigorously for two further 1-minute intervals each time. Evaporate the combined extracts to dryness at about 30° under reduced pressure and dissolve the residue in sufficient 0.1M *hydrochloric acid* to produce 25 ml (solution A). Dilute 10 ml of solution A to 50 ml with *water* (solution B). To a further 10 ml of solution A add 5 ml of *peroxyacetic acid solution*, allow to stand for 10 minutes and add sufficient *water* to produce 50 ml (solution C). Measure the *absorbance* of solution C at the maximum at 343 nm, Appendix II B, using solution B in the reference cell. Repeat the procedure using a 0.04% w/v solution of *prochlorperazine mesilate BPCRS* in 0.1M *hydrochloric acid* in place of solution A and beginning at the words 'Dilute 10 ml of...'. Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{20}H_{24}ClN_3S,2CH_4SO_3$, weight in volume, using the declared content of $C_{20}H_{24}ClN_3S,2CH_4SO_3$ in *prochlorperazine mesilate BPCRS*.

STORAGE

Prochlorperazine Oral Solution should be protected from light.

Prochlorperazine Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Prochlorperazine Tablets contain Prochlorperazine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of prochlorperazine maleate, $C_{20}H_{24}ClN_3S,2C_4H_4O_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 50 mg of Prochlorperazine Maleate add 20 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake and extract with 50 ml of *dichloromethane* and evaporate the dichloromethane layer to dryness. The *infrared absorption spectrum* of a thin film of the residue, Appendix II A, is concordant with the *reference spectrum* of prochlorperazine (*RS 390*).

B. To a quantity of the powdered tablets containing 5 mg of Prochlorperazine Maleate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

C. To a quantity of the powdered tablets containing 0.2 g of Prochlorperazine Maleate add 2 ml of *water* and 1 ml of 5M *sodium hydroxide*, mix and extract with three 10 ml quantities of *ether*. Dry the combined extracts with *anhydrous sodium sulphate*, filter, evaporate to dryness, dissolve the residue in 10 ml of *methanol* and add a solution of 0.15 g of *picric acid* in 10 ml of *methanol*. The *melting point* of the precipitate, after washing with a small quantity of *methanol*, is about 255°, with decomposition, Appendix V A.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using a silica gel GF_{254} precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *acetone*, 10 volumes of *diethylamine* and 80 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 60 mg of Prochlorperazine Maleate with 5 ml of 0.18M *methanolic ammonia*, shake for 15 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 0.006% w/v of *prochlorperazine maleate BPCRS* in 0.18M *methanolic ammonia*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Weigh and finely powder 20 tablets. To a quantity of the powdered tablets containing 10 mg of Prochlorperazine Maleate add 50 ml of 1M *methanesulphonic acid*, shake for 5 minutes and disperse with the aid of ultrasound for 2 minutes. Add sufficient 1M *methanesulphonic acid* to produce 100 ml, mix, centrifuge the mixture and dilute 10 ml of the supernatant liquid to 100 ml with *water*. Measure the *absorbance* of the resulting solution at 254 nm, Appendix II B, using 0.1M *methanesulphonic acid* in the reference cell. Measure the *absorbance* of a solution prepared by diluting 1 volume of a 0.01% w/v solution of *prochlorperazine maleate BPCRS* in 1M *methanesulphonic acid* to 10 volumes with *water* using 0.1M *methanesulphonic acid* in the reference cell. Calculate the content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ from the absorbances obtained and from the declared content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ in *prochlorperazine maleate BPCRS*.

STORAGE

Prochlorperazine Tablets should be protected from light.

Procyclidine Injection

General Notices

Action and use

Anticholinergic.

DEFINITION

Procyclidine Injection is a sterile solution of Procyclidine Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of procyclidine hydrochloride, $C_{19}H_{29}NO,HCl$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Extract a volume of the injection containing 30 mg of Procyclidine Hydrochloride with three 5 ml quantities of *dichloromethane*, dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of procyclidine hydrochloride (*RS 292*).

B. Carry out the method described in the test for Related substances under Procyclidine Tablets but applying 2 µl of each of the following solutions. For solution (1) dilute the injection, if necessary, with *water* to give a solution containing 0.50% w/v of Procyclidine Hydrochloride. Solution (2) contains 0.50% w/v of *procyclidine hydrochloride BPCRS*. By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.0 to 6.8, Appendix V L.

Related substances

Complies with the test for Related substances described under Procyclidine Tablets but applying 20 µl of each of the following solutions. For solution (1) dilute the injection, if necessary, with *water* to give a solution containing 0.50% w/v of Procyclidine Hydrochloride. Solution (2) contains 0.0010% w/v of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride BPCRS* in *chloroform*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *water*.

ASSAY

Record *second-derivative ultraviolet absorption spectra*, Appendix II B, of the following solutions in the range 220 to 280 nm. For solution (1) dilute a volume of the injection containing 25 mg of Procyclidine Hydrochloride to 100 ml with 0.1M *hydrochloric acid*. Solution (2) contains 0.025% w/v of *procyclidine hydrochloride BPCRS* in 0.1M *hydrochloric acid*.

For each solution measure the amplitude from the largest trough at about 257 nm to the largest peak at about 254 nm. Calculate the content of $C_{19}H_{29}NO,HCl$ using the declared content of $C_{19}H_{29}NO,HCl$ in *procyclidine hydrochloride BPCRS*.

Procyclidine Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Procyclidine Tablets contain Procyclidine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of procyclidine hydrochloride, $C_{19}H_{29}NO,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Disperse a quantity of the powdered tablets containing 25 mg of Procyclidine Hydrochloride in 10 ml of *water*, shake with 20 ml of *ether* and discard the ether layer. Make the aqueous layer alkaline with 2M *sodium hydroxide* and extract with two 20 ml quantities of *ether*. Wash the combined ether extracts with two 10 ml quantities of *water*, dry by shaking with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. If necessary, induce crystallisation by scratching with a glass rod. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of procyclidine (*RS 291*).

B. The powdered tablets yield the reactions characteristic of *chlorides*, Appendix VI.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 1 volume of 13.5M *ammonia* and 100 volumes of *ether* as the mobile phase. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 25 mg of Procyclidine Hydrochloride with 5 ml of *chloroform* and filter. Solution (2) contains 0.001% w/v of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride BPCRS* in *chloroform*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *chloroform*. After removal of the plate, dry it at 105° for 15 minutes and examine under *ultraviolet light* (*254 nm*). Any spot corresponding to 1-phenyl-3-pyrrolidinopropan-1-one in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%). Spray the plate with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%). Disregard any spot due to excipient on the line of application.

ASSAY

Weigh and finely powder 20 tablets. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 220 to 280 nm. For solution (1) add 80 ml of 0.1M *hydrochloric acid* to a quantity of the powdered tablets containing 25 mg of

Procyclidine Hydrochloride, mix with the aid of ultrasound for 15 minutes, cool, dilute to 100 ml with 0.1M *hydrochloric acid* and filter through a glass fibre paper having a maximum pore size of 0.7 µm (Whatman GF/F paper is suitable) discarding the first 10 ml of filtrate. Solution (2) contains 0.025% w/v of *procyclidine hydrochloride BPCRS* in 0.1M *hydrochloric acid*.

For each solution measure the amplitude from the largest trough at about 257 nm to the largest peak at about 254 nm. Calculate the content of $C_{19}H_{29}NO,HCl$ using the declared content of $C_{19}H_{29}NO,HCl$ in *procyclidine hydrochloride BPCRS*.

Progesterone Injection

General Notices

Action and use

Progestogen.

DEFINITION

Progesterone Injection is a sterile solution of Progesterone in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these. It may contain suitable alcohols.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of progesterone, $C_{21}H_{30}O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Dissolve a volume containing 50 mg of Progesterone in 8 ml of *petroleum spirit* (*boiling range, 40° to 60°*) and extract with three 8 ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *petroleum spirit* (*boiling range, 40° to 60°*), dilute with *water* until the solution becomes turbid, allow to stand in ice for 2 hours and filter. The precipitate, after washing with *water* and drying at 105°, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of progesterone (*RS 293*).

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent II* and *mobile phase E*.

ASSAY

To a quantity containing 50 mg of Progesterone add sufficient *chloroform* to produce 100 ml. Dilute 3 ml to 50 ml with *chloroform* and to 5 ml of the solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20 ml. Allow to stand for 45 minutes and measure the *absorbance* of the resulting solution at the maximum at 380 nm, Appendix II B, using in the reference cell 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{21}H_{30}O_2$ from the *absorbance* obtained by repeating the operation using a 0.003% w/v solution of *progesterone BPCRS* in *chloroform* and beginning at the words 'to 5 ml ...'.

STORAGE

Progesterone Injection should be protected from light. On standing, solid matter may separate; it should be redissolved by heating before use.

LABELLING

The label states that the preparation is intended for intramuscular injection only.

Proguanil Tablets

General Notices

Action and use

Antiprotozoal (malaria).

DEFINITION

Proguanil Tablets contain Proguanil Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of proguanil hydrochloride, $C_{11}H_{16}ClN_5,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 0.2 g of Proguanil Hydrochloride add 25 ml of *methanol*, shake for 10 minutes, filter, evaporate the filtrate to dryness and dry the residue at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of proguanil hydrochloride (*RS 294*).

B. Boil a quantity of the powdered tablets containing 0.5 g of Proguanil Hydrochloride with 5 ml of 2M *hydrochloric acid*, cool and filter. To the filtrate add a slight excess of 5M *sodium hydroxide*, extract with 30 ml of *ether*, evaporate the ether and dry the residue at 105°. The *melting point* of the residue is about 131°, Appendix V A.

TESTS

4-Chloroaniline

To a quantity of the powdered tablets containing 0.1 g of Proguanil Hydrochloride add 5 ml of *ethanol* (*96%*) and shake for 10 minutes. Add 2.5 ml of 2M *hydrochloric acid* and 15 ml of *water*, mix and filter through a moistened filter paper, washing the filter with 5 ml of *water*. Cool the filtrate to 5°, add 1 ml of 0.05M *sodium nitrite*, allow to stand at 5° for 5 minutes, add 2 ml of a 5% w/v solution of *ammonium sulphamate* and allow to stand for 10 minutes. Add 2 ml of a 0.1% w/v solution of N-(*1-naphthyl*)*ethylenediamine dihydrochloride*, dilute to 50 ml with *water* and allow to stand for 30 minutes. Any magenta colour produced is not more intense than that obtained by treating in the same manner and at the same time 20 ml of a solution containing 1.25 µg per ml of *4-chloroaniline* (250 ppm).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 ml of *methanol* to a quantity of the powdered tablets containing 0.1 g of Proguanil Hydrochloride, shake for 10 minutes, dilute to 100 ml with *methanol*, mix, filter and dilute 5 ml of the filtrate to 50 ml with the mobile phase. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) mix 1 volume of a 0.05%

w/v solution of *1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride BPCRS* in *methanol* with 9 volumes of a 0.010% w/v solution of *proguanil hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable) and maintained at 40°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution prepared by dissolving 1.89 g of *sodium hexanesulphonate* in a mixture of 500 ml of *methanol*, 500 ml of *water* and 5 ml of *glacial acetic acid* and (c) a detection wavelength of 254 nm.

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated peaks due to proguanil hydrochloride and 1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride.

The sum of the areas of any *secondary peaks* in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of 0.2M *hydrochloric acid* containing 0.2% w/v of *sodium chloride* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute 2 ml of the filtrate to 10 ml with dissolution medium. Measure the *absorbance* of this solution, Appendix II B, at 242 nm using dissolution medium in the reference cell. Measure the *absorbance* of a 0.001% w/v solution of *proguanil hydrochloride BPCRS* in dissolution medium using dissolution medium in the reference cell. Calculate the total content of proguanil hydrochloride, $C_{11}H_{16}ClN_5,HCl$, in the medium from the absorbances obtained and from the declared content of $C_{11}H_{16}ClN_5,HCl$ in *proguanil hydrochloride BPCRS*.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) weigh and powder 20 tablets, add 50 ml of *methanol* to a quantity of the powdered tablets containing 0.1 g of Proguanil Hydrochloride, shake for 10 minutes, dilute to 100 ml with *methanol*, mix and filter. To 5 ml of the filtrate add sufficient *methanol* to produce 50 ml and dilute 10 ml of the resulting solution to 50 ml with the mobile phase. Solution (2) contains 0.002% w/v of *proguanil hydrochloride BPCRS* in the mobile phase. For solution (3) mix 1 volume of a 0.05% w/v solution of *1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride BPCRS* in *methanol* with 9 volumes of a 0.010% w/v solution of *proguanil hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure described under Related substances may be used.

The assay is not valid unless the chromatogram obtained with solution (3) shows two clearly separated peaks due to proguanil hydrochloride and 1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride.

Calculate the content of $C_{11}H_{16}ClN_5,HCl$ in the tablets using the declared content of $C_{11}H_{16}ClN_5,HCl$ in *proguanil hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Proguanil Hydrochloride.

Prolonged-release Potassium Chloride Tablets

General Notices

Slow Potassium Chloride Tablets

Prolonged-release Potassium Chloride Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Potassium Chloride Tablets contain Potassium Chloride and are formulated so as to release the medicament over a period of several hours. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of potassium chloride. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Stir 3 tablets in successive 20 ml portions of *water* until the outer coating is removed and separate the cores from the water. The powdered cores comply with the following tests.

A. Yield reaction A characteristic of *chlorides*, Appendix VI.

B. Yield the reactions characteristic of *potassium salts*, Appendix VI.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 ml of *water* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium after 1, 2 and 6 hours and treat each sample in the following manner. Add 25 ml of *water*, 5 ml of a 25% v/v solution of *glacial acetic acid* and 0.1 ml of a saturated solution of *potassium sulphate* and titrate with 0.01M *silver nitrate VS* determining the end point potentiometrically. Each ml of 0.01M *silver nitrate VS* is equivalent to 0.7455 mg of KCl. The amount of potassium chloride released after 1 hour is not more than 50%, after 2 hours is not less than 25% and not more than 75%, and after 6 hours is not less than 75%, calculated with reference to the declared content of Potassium Chloride.

ASSAY

Shake 10 whole tablets with 400 ml of *water* for 30 minutes then heat on a water bath for 45 minutes. Cool, add sufficient *water* to produce 500 ml and allow to stand for 24 hours. Filter and dilute to give a suitable concentration. Carry out the method for *atomic emission spectrophotometry*, Appendix II D, measuring at 766.5 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, to prepare the standard solutions. Each mg of potassium is equivalent to 1.908 mg of KCl.

Prolonged-release Propranolol Capsules

General Notices

Prolonged-release Propranolol Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Beta-adrenoceptor agonist.

DEFINITION

Prolonged-release Propranolol Capsules contain Propranolol Hydrochloride. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Propranolol Hydrochloride. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of propranolol hydrochloride, $C_{16}H_{21}NO_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. The *light absorption* of the solution obtained in the Assay, Appendix II B, exhibits two maxima, at 290 nm and 319 nm, and a shoulder at 306 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and a mixture of 1 volume of 18M *ammonia* and 99 volumes of *methanol* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered capsule contents containing 20 mg of Propranolol Hydrochloride with 10 ml of *methanol* for 5 minutes and filter (Whatman No. 1 paper is suitable). Solution (2) contains 0.2% w/v of *propranolol hydrochloride* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, injecting 10 µl of each of the following solutions. Solution (1) contains 0.1% w/v of *propranolol hydrochloride for performance test EPCRS* in the mobile phase. For solution (2) add 100 ml of *methanol* to a quantity of the powdered capsule contents containing 0.1 g of Propranolol Hydrochloride, mix with the aid of ultrasound for 15 minutes, shaking occasionally, filter through a glass-microfibre filter (Whatman GF/C is suitable) and use the filtrate. For solution (3) dilute 1 volume of solution (1) to 500 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5µ is suitable), (b) as the mobile phase with a flow rate of 1.8 ml per minute a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7% w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, the mixture adjusted to pH 3.3 with 2M *sodium hydroxide*, and (c) a detection wavelength of 292 nm.

Inject 20 µl of solution (1). When the chromatogram is recorded in the prescribed conditions, the appearance and acceptance criteria specified in the leaflet which accompanies *propranolol hydrochloride for performance test EPCRS* are met.

For solutions (2) and (3) record the chromatograms for five times the retention time of the principal peak. In the chromatogram obtained with solution (2) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (3) (0.8%).

ASSAY

To a quantity of the powdered mixed contents of 20 capsules containing 80 mg of Propranolol Hydrochloride add about 150 ml of *methanol*, heat to boiling and boil for 2 minutes, remove from the heat, shake for 20 minutes, cool to 20° and add sufficient *methanol* to produce 200 ml. Filter (Whatman No. 1 paper is suitable), discarding the first 20 ml of filtrate, and dilute 10 volumes of the filtrate to 200 volumes with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B, using *methanol* in the reference cell. Calculate the content of $C_{16}H_{21}NO_2,HCl$ taking 206 as the value of A(1%, 1 cm) at the maximum at 290 nm.

Promazine Injection

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Promazine Injection is a sterile solution of Promazine Hydrochloride in Water for Injections free from dissolved air.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of promazine hydrochloride, $C_{17}H_{20}N_2S,HCl$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. To a volume containing 0.1 g of Promazine Hydrochloride add 20 ml of *water* and 2 ml of 10M *sodium hydroxide*. Shake and extract the mixture with 25 ml of *ether*. Wash the ether with two 5 ml quantities of *water*, dry with *anhydrous sodium sulphate* and evaporate the ether to dryness. Dissolve the residue in 1 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of promazine (*RS 295*).

B. To a volume containing 5 mg of Promazine Hydrochloride carefully add 2 ml of *sulphuric acid* and allow to stand for 5 minutes. An orange colour is produced.

C. To a volume containing 0.2 g of Promazine Hydrochloride add 1 ml of 1M *sodium hydroxide* and extract with four 10 ml quantities of *ether*. Wash the combined extracts with 10 ml of *water*, remove the ether and dissolve the residue in 4 ml of *methanol*. Heat on a water bath almost to boiling, immediately add 2 ml of a boiling 3.5% w/v solution of *picric acid* in *methanol* and boil for 2 minutes. Cool in ice, filter, wash the crystals with three quantities of *methanol*, dissolve in 10 ml of hot *methanol* and repeat the crystallisation and washing. The *melting point* of the rust-red crystals so obtained, after drying at 105° for 1 hour, is about 144°, Appendix V A.

TESTS

Acidity

pH, 4.4 to 5.2, Appendix V L.

Related substances

Carry out the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and applying separately to the plate 10 µl of each of the following freshly prepared solutions. For solution (1) dilute a volume of the injection with sufficient *methanol* to produce a solution containing 1.0% w/v of Promazine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 40 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (2.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the following procedure protected from light. To a quantity containing 50 mg of Promazine Hydrochloride add 5 ml of 2M *hydrochloric acid* and sufficient *water* to produce 1000 ml. To 10 ml add 10 ml of 0.1M *hydrochloric acid*, dilute to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 251 nm, Appendix II B. Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 935 as the value of A(1%, 1 cm) at the maximum at 251 nm.

STORAGE

Promazine Injection should be protected from light.

Promazine Tablets

General Notices

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Promazine Tablets contain Promazine Hydrochloride. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of promazine hydrochloride, $C_{17}H_{20}N_2S,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 40 mg of Promazine Hydrochloride add 10 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of promazine (*RS 295*).

B. To a quantity of the powdered tablets containing 5 mg of Promazine Hydrochloride add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. An orange colour is produced.

C. Triturate a quantity of the powdered tablets containing 0.2 g of Promazine Hydrochloride with 4 ml of *methanol*, centrifuge, filter the supernatant liquid, heat almost to boiling, immediately add 2 ml of a boiling 3.5% w/v solution of *picric acid* in *methanol* and boil for 2 minutes. Cool in ice, filter, wash the crystals with three quantities of *methanol*, dissolve in 10 ml of hot *methanol* and repeat the crystallisation and washing. The *melting point* of the rust red crystals so obtained, after drying at 105° for 1 hour, is about 144°, Appendix V A.

Related substances

Comply with the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase A* and the following freshly prepared solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Promazine Hydrochloride with 10 ml of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. Triturate a quantity of the powder containing 50 mg of Promazine Hydrochloride with 10 ml of 2M *hydrochloric acid* and then add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500 ml and centrifuge about 50 ml of the mixture. To 5 ml of the clear, supernatant liquid add 10 ml of 0.1M *hydrochloric acid* and sufficient *water* to produce 100 ml. Measure the *absorbance* of the resulting solution at the maximum at 251 nm, Appendix II B. Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 935 as the value of A(1%, 1 cm) at the maximum at 251 nm.

Promethazine Hydrochloride Tablets

General Notices

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Promethazine Hydrochloride Tablets contain Promethazine Hydrochloride. They are coated.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of promethazine hydrochloride, $C_{17}H_{20}N_2S,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 40 mg of Promethazine Hydrochloride add 10 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of promethazine (*RS 297*).

B. To a quantity of the powdered tablets containing 5 mg of Promethazine Hydrochloride add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

C. Dissolve a quantity of the powdered tablets containing 0.2 g of Promethazine Hydrochloride in 2 ml of *water*, filter, saturate with *potassium carbonate sesquihydrate*, extract with two 10 ml quantities of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol* at about 50°. Cool, scratch the side of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The *melting point* of the crystals, after washing with *methanol* and drying, is about 160°, Appendix V A.

Related substances

Carry out the test for *related substances in phenothiazines*, Appendix III A, using *mobile phase B* and applying separately to the plate 20 µl of each of the following freshly prepared solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Promethazine Hydrochloride with 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filter. Solution (2) contains 0.010% w/v of *isopromethazine hydrochloride BPCRS* in the same solvent. For solution (3) dilute 1 volume of solution (1) to 200 volumes with the same solvent. Any spot corresponding to isopromethazine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. Triturate a quantity of the powder containing 50 mg of Promethazine Hydrochloride with 10 ml of 2M *hydrochloric acid* and add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500 ml and centrifuge about 50 ml of the mixture. To 5 ml of the clear, supernatant liquid add 10 ml of 0.1M *hydrochloric acid* and sufficient *water* to produce 100 ml. Measure the *absorbance* of the resulting solution at the maximum at 249 nm, Appendix II B. Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 910 as the value of A(1%, 1 cm) at the maximum at 249 nm.

Promethazine Injection

General Notices

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Promethazine Injection is a sterile solution of Promethazine Hydrochloride in Water for Injections free from dissolved air.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of promethazine hydrochloride, $C_{17}H_{20}N_2S,HCl$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. To a volume containing 0.1 g of Promethazine Hydrochloride add 20 ml of *water* and 2 ml of 10M *sodium hydroxide*. Shake and extract the mixture with 25 ml of *ether*. Wash the ether layer with two 5 ml quantities of *water*, dry with *anhydrous sodium sulphate* and evaporate the ether. Dissolve the residue in 1 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of promethazine (*RS 297*).

B. To a volume containing 5 mg of Promethazine Hydrochloride carefully add 2 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

C. To a volume containing 0.2 g of Promethazine Hydrochloride add sufficient *potassium carbonate sesquihydrate* to saturate the solution, extract with two 10-ml quantities of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the side of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The *melting point* of the residue, after washing with *methanol* and drying, is about 160°, Appendix V A.

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light under an atmosphere of nitrogen using *silica gel GF_{254}* as the coating substance (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 15 volumes of *diethylamine*, 45 volumes of *hexane* and 50 volumes of *acetone* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µl of each of the following freshly prepared solutions. For solution (1) use a volume of the injection diluted, if necessary, with a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol* to contain 1.0% w/v of Promethazine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 200 volumes with a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. Solution (3) contains 0.01% w/v of *isopromethazine hydrochloride BPCRS* in a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. Solution (4) contains 0.025% w/v of *promethazine sulphoxide BPCRS* in a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. After removal of the plate, allow it to dry in air, spray with a 20% w/v solution of *perchloric acid* and heat at 100° for 5 minutes. In the chromatogram obtained with solution (1) any spot corresponding to isopromethazine is not more intense than the principal spot in the chromatogram obtained with solution (3) (1%), any spot corresponding to promethazine sulphoxide is not more intense than the spot in the chromatogram obtained with solution (4) (2.5%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Carry out the following procedure protected from light. To a volume containing 25 mg of Promethazine Hydrochloride add sufficient 0.01M *hydrochloric acid* to produce 100 ml. Dilute 10 ml to 100 ml with 0.01M *hydrochloric acid*, dilute 10 ml of this solution to 50 ml with 0.01M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 249 nm, Appendix II B. Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 910 as the value of A (1%, 1 cm) at the maximum at 249 nm.

STORAGE

Promethazine Injection should be protected from light.

Promethazine Oral Solution

General Notices

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Promethazine Oral Solution is a solution containing Promethazine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of promethazine hydrochloride, $C_{17}H_{20}N_2S,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *identification of phenothiazines*, Appendix III A, but applying as solution (1) 5 µl of a solution prepared by diluting a suitable volume of the oral solution with *water* to contain 0.08% w/v of Promethazine Hydrochloride.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light under an atmosphere of nitrogen using *silica gel GF_{254}* as the coating substance (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 15 volumes of *diethylamine*, 45 volumes of *hexane* and 50 volumes of *acetone* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µl of each of the following freshly prepared solutions. For solution (1) add 50 ml of *water* and 10 ml of a 5% w/v solution of *sodium hydroxide* to a quantity of the oral solution containing 20 mg of Promethazine Hydrochloride in a separating funnel and swirl to mix. Extract with two 100 ml quantities of *chloroform*, shaking vigorously for 1 minute each time, and filter successively through *anhydrous sodium sulphate*, washing the sodium sulphate with 50 ml of *chloroform*. Evaporate the combined extracts and washings to dryness at 30° using a rotary evaporator and dissolve the residue in 2 ml of a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent. Solution (3) contains 0.01% w/v of *isopromethazine hydrochloride BPCRS* in the same solvent. Solution (4) contains 0.025% w/v of *promethazine sulphoxide BPCRS* in the same solvent. After removal of the plate, allow it to dry in air, spray with a 20% w/v solution of *perchloric acid* and heat at 100° for 5 minutes. In the chromatogram obtained with solution (1) any spot corresponding to isopromethazine is not more intense than the principal spot in the chromatogram obtained with solution (3) (1%), any spot corresponding to promethazine sulphoxide is not more intense than the principal spot in the chromatogram obtained with solution (4) (2.5%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Carry out the following procedure protected from light. To a weighed quantity containing 10 mg of Promethazine Hydrochloride add 25 ml of *water* and 5 ml of a 5% w/v solution of *sodium hydroxide*. Extract the mixture with two 50 ml quantities of *chloroform*, shaking vigorously for 1 minute each time, evaporate the combined extracts to dryness at about 30° at a pressure of 2 kPa and dissolve the residue in sufficient 0.1M *hydrochloric acid* to produce 50 ml (solution A). Dilute 10 ml of solution A to 50 ml with *water* (solution B). To a further 10 ml of solution A add 5 ml of *peroxyacetic acid solution*, allow to stand for 10 minutes and add sufficient *water* to produce 50 ml (solution C). Measure the *absorbance* of solution C at the maximum at 336 nm, Appendix II B, using solution B in the reference cell and measure the *absorbance* of solution B at the same wavelength using *water* in the reference cell. Repeat the procedure using a 0.02% w/v solution of *promethazine hydrochloride BPCRS* in 0.1M *hydrochloric acid* in place of solution A and beginning at the words 'Dilute 10 ml of...'. Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{17}H_{20}N_2S,HCl$, weight in volume, using the declared content of $C_{17}H_{20}N_2S,HCl$ in *promethazine hydrochloride BPCRS*. The result is not valid if the absorbance of solution B is more than 0.10.

STORAGE

Promethazine Oral Solution should be protected from light.

Promethazine Teoclate Tablets

General Notices

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Promethazine Teoclate Tablets contain Promethazine Teoclate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of promethazine teoclate, $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 60 mg of Promethazine Teoclate add 10 ml of *water* and 2 ml of 1M *sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of promethazine (*RS 297*).

B. To a quantity of the powdered tablets containing 5 mg of Promethazine Teoclate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

C. Extract a quantity of the powdered tablets containing 0.2 g of Promethazine Teoclate with *chloroform*, filter and evaporate the filtrate to dryness. Shake the residue with 10 ml of *water*, add 4 ml of 5M *ammonia* and extract with two 30 ml quantities of *ether*. Wash the combined extracts with 10 ml of *water* and reserve the aqueous layer and washings. To the combined aqueous layer and washings add 4 ml of *hydrochloric acid*; a white precipitate is produced. Filter, wash the residue with *water* and dry at 105°. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness. A reddish residue remains which becomes purple on exposure to the vapour of 5M *ammonia*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *cyclohexane* as the mobile phase. Pour the mobile phase into an unlined tank, immediately place the prepared plate in the tank, close the tank and allow the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.2 g of Promethazine Teoclate with 10 ml of a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol* for 5 minutes, filter (Whatman GF/C filter paper is suitable) and use the filtrate. Solution (2) contains 0.02% w/v of *isopromethazine hydrochloride BPCRS* in a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. For solution (4) dilute 1 volume of solution (1) to 500 volumes with a mixture of 5 volumes of *diethylamine* and 95 volumes of *methanol*. Allow the plate to dry in air and examine under *ultraviolet light* (*254 nm*). In the chromatogram obtained with solution (1) any spot corresponding to isopromethazine hydrochloride is not more intense than the spot in the chromatogram obtained with solution (2) (1%), any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and not more than three such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.2%). Disregard any spot remaining on the line of application.

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. To a quantity of the powder containing 50 mg of Promethazine Teoclate add 5 ml of *water* and 1 ml of 13.5M *ammonia* and allow to stand for 5 minutes. Add 50 ml of *absolute ethanol*, shake for 5 minutes and filter, washing the residue with five 5 ml quantities of *absolute ethanol*. Add sufficient *absolute ethanol* to the filtrate to produce 100 ml. Dilute 10 ml to 100 ml with *absolute ethanol* and dilute 10 ml of this dilution to 100 ml with *absolute ethanol*. Measure the *absorbance* of the resulting solution at the maximum at 255 nm, Appendix II B. Calculate the content of $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$ taking 755 as the value of A(1%, 1 cm) at the maximum at 255 nm.

STORAGE

Promethazine Teoclate Tablets should be protected from light.

Propantheline Tablets

General Notices

Action and use

Anticholinergic.

DEFINITION

Propantheline Tablets contain Propantheline Bromide. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of propantheline bromide, $C_{23}H_{30}BrNO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Triturate a quantity of the powdered tablets containing 75 mg of Propantheline Bromide with 10 ml of *chloroform*, filter, evaporate the chloroform and stir the residue with 5 ml of *ether* until it solidifies. The solid complies with the following tests.

A. Dissolve 60 mg in 2 ml of *water*, add 2 ml of 5M *sodium hydroxide*, boil for 2 minutes, cool slightly, acidify with 2M *hydrochloric acid*, heat to boiling, add *ethanol* (*96%*) drop wise until the precipitate just dissolves, cool and filter. The *melting point* of the residue, after washing with *water*, recrystallising from *ethanol* (*50%*) and drying at 105° for 1 hour, is about 215°, Appendix V A. The crystals dissolve in *sulphuric acid* to produce a bright yellow solution which fluoresces strongly in ultraviolet light (365 nm).

B. Yields the reactions characteristic of *bromides*, Appendix VI.

TESTS

Xanthanoic acid

Shake the combined ether extracts reserved in the Assay with two 30 ml quantities of 0.1M *sodium hydroxide* containing 1.5% w/v of *sodium chloride*. Remove the ether from the combined aqueous extracts by heating on a water bath, add sufficient 0.1M *sodium hydroxide* to produce 100 ml and dilute 25 ml to 100 ml with 0.1M *sodium hydroxide*. The *absorbance* of the resulting solution at the maximum at 248 nm is not more than 0.31, Appendix II B.

ASSAY

Weigh and powder 20 tablets or more if necessary. Place a quantity of the powder containing 0.5 g of Propantheline Bromide on a sintered-glass filter, add 10 ml of *peroxide-free ether*, dried over sodium and distilled before use, stir and filter. Repeat the extraction with four 10 ml quantities of the ether and reserve the combined ether extracts for the test for Xanthanoic acid. Extract the residue on the filter with four 10 ml quantities of *chloroform*, evaporate the combined chloroform extracts to about 10 ml, add 10 ml of *mercury*(*II*) *acetate solution* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 44.84 mg of $C_{23}H_{30}BrNO_3$.

Propofol Injection

General Notices

Action and use

Intravenous general anaesthetic.

DEFINITION

Propofol Injection is a sterile emulsion of Propofol in a suitable basis.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of propofol, $C_{12}H_{18}O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a volume of the injection containing 0.1 g of Propofol with three 25 ml quantities of *hexane* and filter the combined extracts using a glass fibre filter (Whatman GF/C is suitable). Extract the filtrate with two 20 ml quantities of *methanol* (90%) and evaporate the combined extracts under reduced pressure. Dissolve the residue obtained in 2 ml of *absolute ethanol* and evaporate to dryness under reduced pressure. Dry the residue at 50° over *phosphorus pentoxide* for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of Propofol (*RS 416*).

In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 8.5, Appendix V L.

Propofol quinone and propofol dimer

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of the well shaken injection with *propan-2-ol* to produce a solution containing 0.08% w/v of Propofol. Solution (2) contains 0.0008% w/v of *propofol EPCRS*, 0.00008% w/v of *propofol impurity J EPCRS* and 0.0002% w/v of *propofol dimer BPCRS* in *propan-2-ol* containing 6.8% v/v of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 2.0 ml per minute a mixture of 40 volumes of *tetrahydrofuran* and 60 volumes of *water* and (c) a detection wavelength of 254 nm.

Inject 20 µl each of solutions (1) and (2). When the chromatograms are recorded using the prescribed conditions the retention time of the principal peak in the chromatogram obtained with solution (2) has a retention time of about 7 minutes. The retention times relative to the principal peak are: propofol impurity J, about 0.8, propofol dimer about 2.5.

Inject solution (1) and continue the chromatography for at least three times the retention time of the principal peak In the chromatogram obtained the area of any peaks corresponding to propofol quinone (propofol impurity J) and propofol dimer are not greater than the areas of the corresponding peaks in the chromatogram obtained with solution (2) (0.1% and 0.25% respectively).

Globule size

Not more than 5000 globules greater than or equal to 2 µm per ml of a 0.01% v/v dilution in a filtered 0.9% w/v solution of *sodium chloride*. By means of suitable equipment, pass the solution through a 50 µm aperture and count the number of globules by monitoring the change in electrical current between two electrodes immersed on either side of the aperture (a Coulter Counter is suitable). Repeat the procedure using the 0.9% w/v solution of *sodium chloride* only to determine the background count.

Free fatty acid

Not greater than 7 millimoles per litre, when determined by the following method. To 5 ml of a well shaken injection add 25 ml of a mixture of 40 volumes of *propan-2-ol*, 10 volumes of *n-heptane* and 1 volume of 0.5M *sulphuric acid* and shake for 1 minute. Allow to stand for 10 minutes, add 15 ml of *n-heptane* and 15 ml of *water*. Mix by inverting the container 10 times and allow to stand for 15 minutes. To 15 ml of the upper phase add 5 ml of *nile blue A solution* and pass a stream of *nitrogen*, previously passed through 0.1M *sodium hydroxide*, through the solution. Titrate with 0.02M *sodium hydroxide VS*, using a microburette. Calculate the content of free fatty acid from a calibration curve prepared from quantities of 1, 2, 4, 6 and 8 ml of a 1.282% w/v solution of *palmitic acid* in *n-heptane*, each diluted to 50 ml with *n-heptane*. Carry out the method described above, using 5 ml of each solution and beginning at the words 'add 25 ml of a mixture…'.

Lysolecithin

Not greater than 0.2% w/v when determined by the following method.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of well shaken injection with mobile phase to produce a solution containing 0.1% w/v of Propofol and filter through a 0.45-µm nylon filter. Solution (2) contains 0.01% w/v of *lysolecithin* in mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm X 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.2 ml per minute a mixture of 7 volumes of *orthophosphoric acid*, 200 volumes of *water* and 300 volumes of *acetonitrile* and (c) a detection wavelength of 210 nm.

Inject 250 µl each of solution (1) and solution (2).

In the chromatogram obtained with solution (1) calculate the content of *lysolecithin* using the following expression.

$$\frac{A_1 \times C_2 \times f}{A_2}$$

where:

A_1 = peak area of lysolecithin in solution (1)

A_2 = peak area of lysolecithin in solution (2)

C_2 = concentration of lysolecithin in solution (2)

f = dilution factor used for solution (1)

Bacterial endotoxins

Carry out the test for *Bacterial endotoxins*, Appendix XIV C. Dilute the injection in *water BET* to give an emulsion containing 5 mg per ml (solution A). The endotoxin limit concentration of solution A is 1.65 IU endotoxin per ml. Carry out the test using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a suitable volume of the well shaken injection with *propan-2-ol* to produce a solution containing 0.08% w/v of Propofol. Solution (2) contains 0.08% w/v of *propofol EPCRS* in *propan-2-ol* containing 6.8% v/v of *water*. Solution (3) contains 0.0008% w/v of *propofol EPCRS* and 0.00008% w/v of *propofol impurity J EPCRS* in *propan-2-ol* containing 6.8% v/v of *water*.

The chromatographic procedure described under Propofol quinone and propofol dimer may be carried out but using a detection wavelength of 275 nm. Inject 20 µl of each solution.

In the chromatogram obtained with solution (3) the principal peak has a retention time of approximately 7 minutes. The test is not valid unless the *resolution factor* between the peaks due to propofol and propofol impurity J is at least 2.5.

Calculate the content of $C_{12}H_{18}O$ in the injection from the chromatograms obtained and using the declared content of $C_{12}H_{18}O$ in *propofol EPCRS.*

STORAGE

Propofol Injection should be stored at a temperature not exceeding 25°. It should not be allowed to freeze.

Propranolol Injection

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Propranolol Injection is a sterile solution of Propranolol Hydrochloride in Water for Injections containing Anhydrous Citric Acid or Citric Acid Monohydrate.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of propranolol hydrochloride, $C_{16}H_{21}NO_2,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Make alkaline with 1M *sodium hydroxide* a volume containing 10 mg of Propranolol Hydrochloride and extract with three 5 ml quantities of *ether*. Wash the combined extracts with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of propranolol (*RS 298*).

B. The *light absorption* of the solution obtained in the Assay, Appendix II B, exhibits two maxima, at 290 nm and 319 nm, and a shoulder at 306 nm.

TESTS

Acidity

pH, 3.0 to 3.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, injecting 10 µl of each of the following solutions. Solution (1) contains 0.1% w/v of *propranolol hydrochloride for performance test EPCRS* in the mobile phase. For solution (2) dilute the injection being examined with *acetonitrile*, if necessary, to contain 0.10% w/v of Propranolol Hydrochloride. For solution (3) dilute 1 volume of solution (1) to 500 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5µ is suitable), (b) as the mobile phase with a flow rate of 1.8 ml per minute a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7% w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, the mixture adjusted to pH 3.3 with 2M *sodium hydroxide*, and (c) a detection wavelength of 292 nm.

Inject 20 µl of solution (1). When the chromatogram is recorded in the prescribed conditions, the appearance and acceptance criteria specified in the leaflet which accompanies *propranolol hydrochloride for performance test EPCRS* are met.

For solutions (2) and (3) record the chromatograms for five times the retention time of the principal peak. In the chromatogram obtained with solution (2) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (3) (0.8%).

ASSAY

To a volume containing 2 mg of Propranolol Hydrochloride add sufficient *methanol* to produce 100 ml and measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B. Calculate the content of $C_{16}H_{21}NO_2,HCl$ taking 206 as the value of A(1%, 1 cm) at the maximum at 290 nm.

Propranolol Tablets

General Notices

Action and use

Beta-adrenoceptor antagonist.

DEFINITION

Propranolol Tablets contain Propranolol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of propranolol hydrochloride, $C_{16}H_{21}NO_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Suspend a quantity of the powdered tablets containing 0.1 g of Propranolol Hydrochloride in 20 ml of *water*, filter, make the filtrate alkaline with 1M *sodium hydroxide* and extract with three 10 ml quantities of *ether*. Wash the combined extracts with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of propranolol (*RS 298*).

B. The *light absorption* of the solution obtained in the Assay, Appendix II B, exhibits two maxima, at 290 nm and 319 nm, and a shoulder at 306 nm.

C. *Melting point* of the residue obtained in test A, about 94°, Appendix V A.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, injecting 10 µl of each of the following solutions. Solution (1) contains 0.1% w/v of *propranolol hydrochloride for performance test EPCRS* in the mobile phase. For solution (2) add 100 ml of *methanol* to a quantity of the powdered tablets containing 0.1 g of Propranolol Hydrochloride, shake, filter through glass-microfibre paper (Whatman GF/C is suitable) and use the filtrate. For solution (3) dilute 1 volume of solution (1) to 500 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5µ is suitable), (b) as the mobile phase with a flow rate of 1.8 ml per minute a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7% w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, the mixture adjusted to pH 3.3 with 2M *sodium hydroxide*, and (c) a detection wavelength of 292 nm.

Inject 20 µl of solution (1). When the chromatogram is recorded in the prescribed conditions, the appearance and acceptance criteria specified in the leaflet which accompanies *propranolol hydrochloride for performance test EPCRS* are met.

For solutions (2) and (3) record the chromatograms for five times the retention time of the principal peak. In the chromatogram obtained with solution (2) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (3) (0.8%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 20 mg of Propranolol Hydrochloride with 20 ml of *water* for 10 minutes. Add 50 ml of *methanol*, shake for a further 10 minutes, add sufficient *methanol* to produce 100 ml and filter. Dilute 10 ml of the filtrate to 50 ml with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B. Calculate the content of $C_{16}H_{21}NO_2$,HCl taking 206 as the value of A(1%, 1 cm) at the maximum at 290 nm.

Propylthiouracil Tablets

General Notices

Action and use

Thiourea antithyroid drug.

DEFINITION

Propylthiouracil Tablets contain Propylthiouracil.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of propylthiouracil, $C_7H_{10}N_2OS$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 20 ml of *methanol* for 10 minutes, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of propylthiouracil (*RS 300*).

B. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 60 ml of *methanol* for 20 minutes, dilute to 100 ml with *methanol* and filter. Dilute 5 ml of this solution to 250 ml with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 274 nm.

C. Extract a quantity of the powdered tablets in a continuous extraction apparatus with *ether* and evaporate the solution to dryness. The *melting point* of the residue, after drying at 105°, is about 219°, Appendix V A.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 0.2 volume of *glacial acetic acid*, 12 volumes of *propan-2-ol* and 100 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 5 ml of *methanol* for 15 minutes, filter and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. Solution (3) contains 0.0010% w/v of *thiourea* in *methanol*. After removal of the plate, allow it to dry in air, examine under *ultraviolet light* (*254 nm*) and expose to iodine vapour for 10 minutes. Any spot corresponding to thiourea in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%). Disregard any spot remaining on the line of application.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.15 g of

Propylthiouracil in a mixture of 20 ml of 0.1M *sodium hydroxide VS* and 75 ml of *water* with the aid of gentle heat. Cool, add 4 g of *sodium acetate*, just acidify the solution to *litmus paper* with 6M *acetic acid*, add 0.5 ml of a freshly prepared 0.5% w/v solution of *1,5-diphenylcarbazone* in *ethanol* (*96%*) and titrate with 0.02M *mercury nitrate VS* until a pinkish violet colour persists for 2 to 3 minutes. Each ml of 0.02M *mercury nitrate VS* is equivalent to 6.808 mg of $C_7H_{10}N_2OS$.

Protamine Sulphate Injection

General Notices

Action and use

Antidote to heparin.

DEFINITION

Protamine Sulphate Injection is a sterile solution of Protamine Sulphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of protamine sulphate

Not less than 80.0% of the stated amount.

IDENTIFICATION

A. Produces a precipitate under the conditions of the Assay.

B. Dilute the injection with *water* to give a solution containing 0.2% w/v of Protamine Sulphate. To 5 ml add 1 ml of a 10% w/v solution of *sodium hydroxide* and 1 ml of a 0.02% w/v solution of *1-naphthol* and mix. Cool to 5° and add 0.5 ml of *sodium hypobromite solution*. An intense pink colour is produced.

C. Heat 2 ml in a water bath at 60° and add 0.1 ml of *mercury*(*II*) *sulphate solution*; no precipitate is produced. Cool the mixture in ice; a white precipitate is produced.

D. Yields reaction A characteristic of *sulphates*, Appendix VI.

TESTS

Acidity

pH, 2.5 to 3.5, Appendix V L.

Optical rotation

Dilute the injection with 0.5M *hydrochloric acid* to produce a solution containing 0.8% w/v of Protamine Sulphate. The *optical rotation* of the resulting solution is –0.52° to –0.68°, Appendix V F.

Light absorption

Dilute the injection, if necessary, with *water* to produce a solution containing 1% w/v of Protamine Sulphate. The *absorbance* at 260 to 280 nm is not more than 0.1, Appendix II B.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing 10 mg of Protamine Sulphate per ml (solution A). The endotoxin limit concentration of solution A is 70 IU of endotoxin per ml. Carry out the test using the maximum allowable concentration of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Carry out the Assay described under Protamine Sulphate using solutions prepared by diluting the injection with *water* to contain (1) 0.015% w/v, (2) 0.010% w/v and (3) 0.005% w/v of Protamine Sulphate.

LABELLING

The label states that the dose is calculated from the results of determinations of the amount required to produce an acceptable blood clotting time in the patient.

Protriptyline Tablets

General Notices

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Protriptyline Tablets contain Protriptyline Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of protriptyline hydrochloride, $C_{19}H_{21}N,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 292 nm.

B. Shake a quantity of the powdered tablets containing 5 mg of Protriptyline Hydrochloride with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5% w/v solution of *sodium hydrogen carbonate*, 1 ml of a 2% w/v solution of *sodium periodate* and 1 ml of a 0.3% w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with 1M *sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*, washing the extract with 10 ml of 0.25M *sulphuric acid*. The *light absorption* of the resulting trimethylpentane solution, Appendix II B, does not exhibit a maximum at 265 nm (distinction from amitriptyline and nortriptyline).

C. Triturate a quantity of the powdered tablets containing 0.1 g of Protriptyline Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve part of the residue in 3 ml of *water* and add 0.05 ml of a 2.5% w/v solution of *quinhydrone* in *methanol*. A red colour develops.

ASSAY

Triturate 10 tablets for 15 minutes with 100 ml of a solution prepared by mixing 1 volume of 1M *hydrochloric acid* and 9 volumes of *methanol*, transfer to a graduated flask using sufficient of the solvent mixture to produce 250 ml, mix and filter through a fine filter paper. Dilute a volume of the filtrate containing 1 mg of Protriptyline Hydrochloride to 100 ml with the solvent mixture and measure the *absorbance* of the resulting solution at the maximum at 292 nm, Appendix II B. Calculate the content of $C_{19}H_{21}N,HCl$ taking 465 as the value of A(1%, 1 cm) at the maximum at 292 nm.

Proxymetacaine Eye Drops

General Notices

Action and use

Local anaesthetic.

DEFINITION

Proxymetacaine Eye Drops are a sterile solution of Proxymetacaine Hydrochloride in Purified Water. They may contain Glycerol.

With the exception that they may be supplied in containers not exceeding 15 ml in capacity, the eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of proxymetacaine hydrochloride, $C_{16}H_{26}N_2O_3$,HCl

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 250 to 350 nm of the solution used in the Assay exhibits two maxima, at 268 nm and 310 nm.

B. To a volume containing 50 mg of Proxymetacaine Hydrochloride add 2 ml of 2M *hydrochloric acid* and extract with 25 ml of *chloroform*. Discard the chloroform layer, make alkaline with 5M *sodium hydroxide* and extract with two 25 ml quantities of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate* and evaporate the filtrate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of proxymetacaine (*RS 302*).

C. A volume containing 5 mg of Proxymetacaine Hydrochloride yields the reaction characteristic of *primary aromatic amines*, Appendix VI.

TESTS

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of *diethylamine*, 30 volumes of *ethyl acetate* and 75 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) use the eye drops, diluted if necessary to contain 0.5% w/v of Proxymetacaine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol*. For solution (3) dilute 1 volume of solution (2) with an equal volume of *methanol*. After removal of the plate, heat it at 105° for 10 minutes, allow to cool and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%). Disregard any spot remaining on the line of application.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 4 volumes of *glacial acetic acid*, 20 volumes of *cyclohexane* and 80 volumes of *1,4-dioxan* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) use solution (1) described in test A above. Solutions (2) and (3) are solutions of *3-amino-4-propoxybenzoic acid BPCRS* in *methanol* containing (2) 0.020% w/v and (3) 0.0050% w/v, respectively. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (4%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%). The principal spot remains on or near the line of application.

ASSAY

Dilute a volume containing 10 mg of Proxymetacaine Hydrochloride to 200 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 310 nm, Appendix II B. Calculate the content of $C_{16}H_{26}N_2O_3$,HCl taking 162 as the value of A(1%, 1 cm) at the maximum at 310 nm.

STORAGE

Proxymetacaine Eye Drops should be protected from light, stored at a temperature of 2° to 8° and should not be allowed to freeze.

Pseudoephedrine Oral Solution

General Notices

Action and use

Adrenoceptor agonist.

DEFINITION

Pseudoephedrine Oral Solution is a solution of Pseudoephedrine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of pseudoephedrine hydrochloride, $C_{10}H_{15}NO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the Oral Solution containing 0.3 g of Pseudoephedrine Hydrochloride, add 4 ml of 2M *hydrochloric acid*, extract with two 40-ml quantities of *ether* and discard the ether. Add sufficient 5M *ammonia* to the aqueous phase to make it alkaline, extract with two 60-ml quantities of *ether*, wash the combined ether extracts with three 30-ml quantities of *water*, dry with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, in the range 1550 to 1350 cm^{-1} and in the range 1250 to 400 cm^{-1} is concordant with the *reference spectrum* of pseudoephedrine *(RS 304)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add sufficient 5M *ammonia* to a volume of the oral solution containing 10 mg of Pseudoephedrine Hydrochloride to make it alkaline, extract with two 100-ml quantities of *ether*, wash the combined extracts with 10 ml of *water*, dry with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the oily residue in sufficient *methanol* to produce 5 ml.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.05% w/v each of *ephedrine hydrochloride BPCRS* and *pseudoephedrine hydrochloride BPCRS* in the mobile phase.

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

(5) Dilute 1 volume of solution (2) to 20 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with particles of *phenylsilyl silica gel for chromatography* (µBondapak Phenyl is suitable).

(b) Use isocratic elution and the mobile phase below.

(c) Use a flow rate of 1 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

A mixture of 6 volumes of *methanol* and 94 volumes of 0.15M *ammonium acetate*, adjusted to pH 4.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of the peak due to ephedrine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (4) (0.2%);

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution containing 60 mg of Pseudoephedrine Hydrochloride to 50 ml with *methanol (65%)*.

(2) 0.12% w/v of *pseudoephedrine hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 263 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

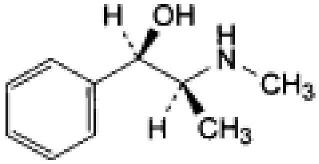
A solution containing 0.005M *dioctyl sodium sulphosuccinate* in a mixture of 1 volume of *glacial acetic acid*, 35 volumes of *water and* 65 volumes of *methanol*

DETERMINATION OF CONTENT

Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{10}H_{15}NO,HCl$, weight in volume, using the declared content of $C_{10}H_{15}NO,HCl$ in *pseudoephedrine hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:



Ephedrine.

Pseudoephedrine Tablets

General Notices

Action and use

Adrenoceptor agonist.

DEFINITION

Pseudoephedrine Tablets contain Pseudoephedrine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pseudoephedrine hydrochloride, $C_{10}H_{15}NO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 60 mg of Pseudoephedrine Hydrochloride with 10 ml of *water* and filter. Shake the filtrate with 10 ml of *ether*, discard the ether, add 1 ml of 1M *sodium hydroxide* to the aqueous layer and extract with two 10 ml quantities of *ether*. Dry the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pseudoephedrine (*RS 304*).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 10 volumes of 5M *ammonia*, 10 volumes of *methanol*, 20 volumes of *acetone*, 20 volumes of *butan-1-ol* and 40 volumes of *butyl acetate* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. Remove any film coating from the tablets before proceeding. For solution (1) add 25 ml of *methanol* to a quantity of the powdered tablets containing 0.5 g of Pseudoephedrine Hydrochloride, shake for 5 minutes, filter, wash the filter with *methanol* and evaporate the combined filtrate and washings to dryness. Dissolve the residue as completely as possible in 5 ml of *methanol*, centrifuge and dilute 1 volume of the supernatant liquid to 10 volumes with *methanol*. Solution (2) contains 1.0% w/v of *pseudephedrine hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in a current of warm air, spray with a solution containing 0.3 g of *ninhydrin* in a mixture of 100 ml of *butan-1-ol* and 3 ml of *glacial acetic acid* and heat at 120° for 20 minutes. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Remove any film coating from the tablets before proceeding. For solution (1) add 25 ml of *methanol* to a quantity of the powdered tablets containing 0.5 g of Pseudoephedrine Hydrochloride, shake for 5 minutes, filter, wash the filter with *methanol* and evaporate the combined filtrate and washings to dryness. Dissolve the residue as completely as possible in 5 ml of *methanol*, centrifuge and dilute 1 ml of the supernatant liquid to 50 ml with the mobile phase. Solution (2) contains 0.002% w/v of *ephedrine hydrochloride BPCRS* in the mobile phase. Solution (3) contains 0.05% w/v of *ephedrine hydrochloride BPCRS* and 0.05% w/v of *pseudoephedrine hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with particles of silica the surface of which has been modified with chemically bonded phenyl groups (µBondapak Phenyl is suitable), (b) a mixture of 6 volumes of *methanol* and 94 volumes of 0.15M *ammonium acetate*, adjusted to pH 4.0 with *glacial acetic acid*, as the mobile phase with a flow rate of 1.0 ml per minute and (c) a detection wavelength of 257 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to ephedrine is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is a 0.12% w/v solution of *pseudoephedrine hydrochloride BPCRS* in *methanol* (*50%*). For solution (2) add 50 ml of 0.1M *hydrochloric acid* to a quantity of the powdered tablets containing 0.12 g of Pseudoephedrine Hydrochloride, mix with the aid of ultrasound for 15 minutes, add sufficient *methanol* to produce 100 ml, filter and use the filtrate.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) 0.005M *dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid* as the mobile phase with a flow rate of 1.5 ml per minute and (c) a detection wavelength of 258 nm.

Calculate the content of $C_{10}H_{15}NO,HCl$ using the declared content of $C_{10}H_{15}NO,HCl$ in *pseudoephedrine hydrochloride BPCRS*.

Pyrazinamide Tablets

General Notices

Action and use

Antituberculosis drug.

DEFINITION

Pyrazinamide Tablets contain Pyrazinamide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pyrazinamide, $C_5H_5N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.25 g of Pyrazinamide with 20 ml of *absolute ethanol*, filter, evaporate the filtrate to dryness and dry the residue at 105° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pyrazinamide (*RS 306*).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 20 volumes of *glacial acetic acid*, 20 volumes of *water* and 60 volumes of *butan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.10 g of Pyrazinamide with 50 ml of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*, filter, evaporate to dryness and dissolve the residue in sufficient of the same solvent mixture to produce 10 ml. For solution (2) dilute 1 volume of solution (1) to 500 volumes with a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*. After removal of the plate, allow it to dry in air and examine immediately under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.1 g of Pyrazinamide add 200 ml of *water*, allow to stand for 10 minutes, swirling occasionally, mix with the aid of ultrasound for 10 minutes and dilute to 500 ml with *water*. Filter and discard the first 20 ml of filtrate. Dilute 5 ml of the filtrate to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 268 nm, Appendix II B. Calculate the content of $C_5H_5N_3O$ taking 650 as the value of A(1%, 1 cm) at the maximum at 268 nm.

Pyridostigmine Tablets

General Notices

Action and use

Cholinesterase inhibitor.

DEFINITION

Pyridostigmine Tablets contain Pyridostigmine Bromide.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pyridostigmine bromide, $C_9H_{13}BrN_2O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Triturate a quantity of the powdered tablets containing 0.1 g of Pyridostigmine Bromide with two 5 ml quantities of *water* and filter. Dilute the filtrate with *water* to contain 0.005% w/v of Pyridostigmine Bromide. The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum at 270 nm. Reserve the filtrate for use in tests B and C.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) dilute 1 volume of the filtrate obtained in test A to 10 volumes with *methanol*.

(2) 0.1% w/v of *pyridostigmine bromide EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µl of each solution.

(d) Develop the plate to 20 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

A mixture of 5 volumes of *water*, 10 volumes of *formic acid*, 35 volumes of *methanol* and 50 volumes of *chloroform.*

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. The filtrate obtained in test A yields the reactions characteristic of *bromides*, Appendix VI.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 0.1 g of Pyridostigmine Bromide with 100 ml of a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water* for 30 minutes and filter through a glass fibre filter (Whatman GF/C is suitable)

(2) Dilute 6 volumes of solution (1) to 100 volumes with a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*.

(3) Dilute 1 volume of solution (1) to 250 volumes with a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*.

(4) 0.0005% w/v each of *pyridostigmine impurity A EPCRS* and *pyridostigmine bromide EPCRS* in the mobile phase.

(5) Dilute 1 volume of solution (3) to 10 volumes with a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.1 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µl of each solution.

(g) Allow the chromatography to continue for at least twice the retention time of the peak due to Pyridostigmine.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of a 0.43% w/v solution of *sodium dodecyl sulphate*, previously adjusted to pH 2.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to pyridostigmine impurity A and pyridostigmine bromide is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to pyridostigmine impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (6%);

the area of any peak corresponding to impurity pyridostigmine impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.4%);

the sum of the areas of any other *secondary peaks* is not greater than the principal peak in the chromatogram obtained with solution (3) (0.4%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.04%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing 0.15 g of Pyridostigmine Bromide with 50 ml of *water* for 30 minutes, filter, wash the residue with *water* and add sufficient *water* to produce 250 ml. Dilute 5 ml to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 270 nm, Appendix II B. Calculate the content of $C_9H_{13}BrN_2O_2$ taking 186 as the value of A(1%, 1 cm) at the maximum at 270 nm.

STORAGE

Pyridostigmine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A and B listed under Pyridostigmine Bromide.

Pyridoxine Tablets

General Notices

Action and use

Vitamin B_6.

DEFINITION

Pyridoxine Tablets contain Pyridoxine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pyridoxine hydrochloride, $C_8H_{11}NO_3,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Pyridoxine Hydrochloride with 50 ml of *methanol* for 15 minutes, warming occasionally, filter and add sufficient 13.5M *ammonia* to make the filtrate alkaline. Evaporate the resulting solution to dryness, dissolve the residue as completely as possible in 15 ml of *chloroform* and filter. To the filtrate add 2 ml of a solution prepared by carefully adding 2 ml of *acetyl chloride* drop wise to 8 ml of cooled *methanol* and evaporate the resulting solution to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pyridoxine hydrochloride (*RS 308*).

B. Shake a quantity of the powdered tablets containing 20 mg of Pyridoxine Hydrochloride with 50 ml of *0.025M standard phosphate buffer* for 15 minutes and dilute to 100 ml with the same solvent. Mix, filter and dilute 5 ml of the filtrate to 100 ml with the same solvent. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 254 nm and 324 nm.

C. Triturate a quantity of the powdered tablets containing 20 mg of Pyridoxine Hydrochloride with 50 ml of *water* and allow to stand. To 1 ml of the supernatant liquid add 10 ml of a 5% w/v solution of *sodium acetate*, 1 ml of *water* and 1 ml of a 0.5% w/v solution of *2-6-dichloroquinone-4-chloroimide* in *ethanol* (*96%*) and shake; a blue colour is produced which fades rapidly and becomes brown. Repeat the operation but adding 1 ml of a 0.3% w/v solution of *boric acid* in place of the 1 ml of *water*; no blue colour is produced.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 9 volumes of 13.5M *ammonia*, 13 volumes of *tetrahydrofuran,* 13 volumes of *dichloromethane* and 65 volumes of *acetone* as the mobile phase. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 40 mg of Pyridoxine Hydrochloride with

10 ml of *water* for 15 minutes, filter and use the filtrate. For solution (2) dilute 1 ml of solution (1) to 200 ml with *water*. After removal of the plate, allow it to dry in air and spray with a 5% w/v solution of *sodium carbonate* in *ethanol* (*30%*). Allow the plate to dry in air, spray with a 0.1% w/v solution of *2,6-dichloroquinone-4-chloroimide* in *ethanol* (*96%*) and examine immediately. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). Disregard any spot remaining on the line of application.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 25 mg of Pyridoxine Hydrochloride add 50 ml of 0.1M *hydrochloric acid* and heat on a water bath for 15 minutes, swirling occasionally. Cool, dilute to 100 ml with 0.1M *hydrochloric acid* and filter, discarding the first 20 ml of filtrate. Dilute 5 ml of the filtrate to 100 ml with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 290 nm, Appendix II B. Calculate the content of $C_8H_{11}NO_3$,HCl taking 430 as the value of A(1%, 1 cm) at the maximum at 290 nm.

STORAGE

Pyridoxine Tablets should be protected from light and stored at a temperature not exceeding 30°.

When vitamin B_6 tablets are prescribed or demanded, Pyridoxine Tablets shall be dispensed or supplied.

Pyrimethamine Tablets

General Notices

Action and use

Dihydrofolate reductase inhibitor; antiprotozoal (malaria).

DEFINITION

Pyrimethamine Tablets contain Pyrimethamine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of pyrimethamine, $C_{12}H_{13}ClN_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Pyrimethamine with 50 ml of *ethanol (96%)* for 20 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of pyrimethamine (*RS 309*).

B. Extract the powdered tablets with 1M *sulphuric acid*, filter and add *potassium tetraiodomercurate solution* to the filtrate. A creamy white precipitate is produced.

C. Extract a quantity of the powdered tablets containing 50 mg of Pyrimethamine with two 10 ml quantities of *chloroform* and evaporate the combined extracts to dryness. The *melting point* of the residue is about 240°, Appendix V A.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 4 volumes of *chloroform*, 8 volumes of *propan-1-ol*, 12 volumes of *glacial acetic acid* and 76 volumes of *toluene* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 20 µl of each of the following freshly prepared solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Pyrimethamine with 5 ml of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 400 volumes with the same solvent mixture. After removal of the plate, allow it to dry in air and examine under *ultraviolet light* (*254 nm*). Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 25 mg of Pyrimethamine add 50 ml of hot 0.1M *hydrochloric acid* and heat on a water bath for 10 minutes, swirling occasionally. Mix with the aid of ultrasound for 30 minutes, remove and cool to room temperature. Add sufficient 0.1M *hydrochloric acid* to produce 100 ml, filter and dilute

5 ml of the filtrate to 100 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 272 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the content of $C_{12}H_{13}ClN_4$ taking 316 as the value of A(1%, 1 cm) at the maximum at 272 nm.

Soluble Paracetamol Tablets

General Notices

Action and use

Analgesic; antipyretic.

DEFINITION

Soluble Paracetamol Tablets contain Paracetamol in either a suitable soluble basis or a suitable soluble, effervescent basis.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve, with or without vigorous effervescence as appropriate, on the addition of warm *water* to produce a slightly opalescent solution.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 257 nm.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 14 cm above the line of application. Apply separately to the plate 40 µl of each of solutions (1), (2) and (3). Pour the mobile phase into the unlined tank, immediately place the prepared plate in the tank and close the tank. For solution (1) add 50 ml of *ethanol* (*96%*) to a quantity of the powdered tablets containing 0.10 g of Paracetamol, shake for 10 minutes, add sufficient *ethanol* (*96%*) to produce 100 ml and filter. Solution (2) contains 0.10% w/v of *paracetamol BPCRS* in *ethanol* (*96%*). For solution (3) dissolve 0.25 g of *4′-chloroacetanilide* and 0.10 g of *paracetamol* in sufficient *ethanol* (*96%*) to produce 100 ml. After removal of the plate, dry it in a current of warm air and examine under *ultraviolet light* (*254 nm*). The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots, the spot corresponding to 4′-chloroacetanilide having the higher Rf value.

TESTS

Disintegration

Comply with the requirements for Soluble Tablets or with the requirement for Effervescent Tablets, as appropriate.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) disperse a quantity of powdered tablets containing 0.2 g of Paracetamol in 8 ml of the mobile phase with the aid of ultrasound, add sufficient mobile phase to produce 10 ml, mix well and filter. For solution (2) dilute 1 volume of solution (1) to 20 volumes with mobile phase and dilute 1 volume of this solution to 20 volumes with mobile phase . Solution (3) contains 0.002% w/v each of *4-aminophenol* and *paracetamol BPCRS* in the mobile phase. Solution (4) contains 0.00002% w/v of *4′-chloroacetanilide* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx C8 is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute, with a temperature of 35°C, a mixture of 250 volumes of *methanol* containing 1.15 g of a 40% v/v solution of *tetrabutylammonium hydroxide* with 375 volumes of 0.05M *disodium hydrogen orthophosphate* and 375 volumes of 0.05M *sodium dihydrogen orthophosphate* and (c) a detection wavelength of 245 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

Inject solution (1) and allow the chromatography to proceed for 12 times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-aminophenol is not greater than the area of the corresponding peak in solution (3) (0.1%), the area of any peak corresponding to 4′-chloroacetanilide is not greater than the area of the principal peak in solution (4) (10 ppm) and no other impurity is greater than the area of the principal peak obtained with solution (2) (0.25%).

ASSAY

Weigh and powder 20 tablets. Add 50 ml of 0.1M *sodium hydroxide* slowly to a quantity of the powdered tablets containing 0.2 g of Paracetamol. If necessary, wait until effervescence has ceased, dilute with 100 ml of *water*, shake for 15 minutes and add sufficient *water* to produce 250 ml. Mix, filter and dilute 10 ml of the filtrate to 100 ml with *water*. Add 10 ml of the resulting solution to 10 ml of 0.1M *sodium hydroxide*, dilute to 100 ml with *water* and measure the *absorbance* of the resulting solution at the maximum at 257 nm, Appendix II B. Calculate the content of $C_8H_9NO_2$ taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

STORAGE

Soluble Paracetamol Tablets should be protected from light.

LABELLING

The label states (1) that the tablets should be dissolved in water immediately before use; (2) where applicable, that the tablets are effervescent.

Sterile Potassium Chloride Concentrate

General Notices

DEFINITION

Sterile Potassium Chloride Concentrate is a sterile solution of Potassium Chloride in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of potassium chloride, KCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The residue on evaporation yields the reactions characteristic of *potassium salts* and the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Acidity or alkalinity

Dilute, if necessary, the concentrate being examined with *carbon dioxide-free water* to contain 10.0% w/v of Potassium Chloride. To 50 ml add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01M *hydrochloric acid* or 0.01M *sodium hydroxide* is required to change the colour of the indicator.

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. Dilute the concentrate being examined with *water BET* to contain 0.5% w/v of Potassium Chloride and adjust the pH, if necessary, to 7 (solution A). The endotoxin limit concentration of solution A is 3.0 IU of endotoxin per ml. Carry out the test using a lysate with a declared sensitivity not less sensitive than 0.0625 IU of endotoxin per ml, and using the maximum valid dilution of solution A calculated from the declared sensitivity of the lysate used in the test.

ASSAY

Dilute 5 ml to 100 ml with *water*. To a volume of the solution containing 0.15 g of Potassium Chloride add 30 ml of *water* and titrate with 0.1M *silver nitrate VS* using *potassium chromate solution* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 7.456 mg of KCl.

LABELLING

The label states (1) 'Sterile Potassium Chloride Concentrate'; (2) the strength as a percentage w/v of Potassium Chloride; (3) the approximate concentration of the potassium ions and the chloride ions in mmol in a suitable volume; (4) the volume of Sodium Chloride Intravenous Infusion (0.9% w/v) or other suitable diluent with which the concentrate must be diluted and mixed well before use.

Sterile Potassium Dihydrogen Phosphate Concentrate

General Notices

Potassium Acid Phosphate Injection

DEFINITION

Sterile Potassium Dihydrogen Phosphate Concentrate is a 13.6% w/v sterile solution of Potassium Dihydrogen Phosphate in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of potassium dihydrogen phosphate, KH_2PO_4

12.9 to 14.3% w/v.

IDENTIFICATION

The residue on evaporation yields the reactions characteristic of *potassium salts* and the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Acidity

pH, 3.5 to 5.0, Appendix V L.

Sterility

Complies with the *test for sterility*, Appendix XVI A.

ASSAY

Titrate 10 ml, saturated with *sodium chloride*, with 0.5M *sodium hydroxide VS* using *phenolphthalein solution* as indicator. Each ml of 0.5M *sodium hydroxide VS* is equivalent to 68.05 mg of KH_2PO_4.

LABELLING

The label states (1) 'Sterile Potassium Dihydrogen Phosphate Concentrate'; (2) the strength as a percentage w/v of Potassium Dihydrogen Phosphate; (3) the approximate concentration of the potassium ions and the phosphate ions in millimoles in a suitable volume; (4) the volume of Sodium Chloride Intravenous Infusion (0.9% w/v) or other suitable diluent with which the concentrate must be diluted and mixed well before use.

Strong Pholcodine Linctus

General Notices

Action and use

Opioid receptor agonist; cough suppressant.

DEFINITION

Strong Pholcodine Linctus is an *oral solution* containing 0.2% w/v of Pholcodine and 2% w/v of Citric Acid Monohydrate in a suitable flavoured vehicle.

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of pholcodine, $C_{23}H_{30}N_2O_4,H_2O$

0.180 to 0.220% w/v.

IDENTIFICATION

To 10 ml add 20 ml of *water*, make alkaline to *litmus paper* with 5M *ammonia*, extract with two 15 ml quantities of *chloroform*, washing each extract with 5 ml of *water*, dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness. If necessary add 0.1 ml of *ether* and scratch the side of the vessel with a glass rod to induce crystallisation. The crystals, dried at a pressure not exceeding 2 kPa, comply with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of pholcodine (*RS 273*).

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.01% w/v solution in 0.01M *sodium hydroxide* exhibits a maximum only at 284 nm.

C. Dissolve the remainder of the crystals in 1 ml of *sulphuric acid* and add 0.05 ml of *ammonium molybdate-sulphuric acid solution*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of 2M *nitric acid*; the colour changes to brownish red.

ASSAY

To 25 g add sufficient 5M *ammonia* to make the solution alkaline to *litmus paper* and extract with four 25-ml quantities of *chloroform*, washing each extract with the same 5 ml of *water*. Combine the extracts and evaporate until the volume is reduced to 15 ml. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *quinaldine red solution* as indicator. Each ml of 0.02M *perchloric acid VS* is equivalent to 4.165 mg of $C_{23}H_{30}N_2O_4,H_2O$. Determine the *weight per ml* of the linctus, Appendix V G, and calculate the content of $C_{23}H_{30}N_2O_4,H_2O$, weight in volume.

STORAGE

Strong Pholcodine Linctus should be protected from light.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Quinidine Sulphate Tablets

General Notices

Action and use

Class I antiarrhythmic.

DEFINITION

Quinidine Sulphate Tablets contain Quinidine Sulphate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of quinidine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *diethylamine*, 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*) and filter. Solution (2) contains 1.0% w/v of *quinidine sulphate EPCRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*). Solution (3) contains 1.0% w/v each of *quinidine sulphate EPCRS* and *quinine sulphate EPCRS*. After removal of the plate, allow it to dry in air and spray with 0.05M *ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. Shake a quantity of the powdered tablets containing 0.25 g of Quinidine Sulphate with 25 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*) and filter. Evaporate the filtrate to dryness and wash the residue with 10 ml of *ether*. Filter, wash the residue with 10 ml of *ether* and dry the residue at 60° at a pressure not exceeding 15 Pa for 2 hours. The pH of a 1% w/v solution of the residue is 6.0 to 6.8, Appendix V L.

C. Extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 20 ml of *water* and filter. The filtrate yields the reactions characteristic of *sulphates*, Appendix VI.

Other cinchona alkaloids

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) mix a quantity of the powdered tablets containing 50 mg of Quinidine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of filtrate. For solution (2) dissolve 20 mg of *quinine sulphate EPCRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase. Prepare solution (3) in the same manner as solution (2) but using *quinidine sulphate EPCRS* in place of *quinine sulphate EPCRS*. Solution (4) is a mixture of equal volumes of solutions (2) and (3). For solution (5) dilute 1 volume of solution (2) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase. Solution (6) contains 0.10% w/v of *thiourea* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5 µm is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with 1M *orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water* and (c) a detection wavelength of 250 nm for recording the chromatogram obtained with solution (6) and 316 nm for the other solutions.

Inject separately 10 µl of each of solutions (3) and (6). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with solution (3) the *capacity factor* of the peak due to quinidine is 3.5 to 4.5, V_0 being calculated from the peak due to thiourea in the chromatogram obtained with solution (6). Inject 10 µl of each of solutions (2), (3), (4) and (5). The chromatogram obtained with solution (2) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with solution (3) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with solution (4) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solutions (2) and (3).

The test is not valid unless (a) in the chromatogram obtained with solution (4) the *resolution factor* between the peaks due to quinine and quinidine is at least 1.5 and the *resolution factor* between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (5) is at least 5.

Inject 10 µl of solution (1) and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by *normalisation*, disregarding any peaks the areas of which are less than that of the peak in the chromatogram obtained with solution (5) (0.2%). The content of dihydroquinidine is not greater than 15%, the content of any related substance eluting before quinidine is not greater than 5% and the content of any other related substance is not greater than 2.5%.

ASSAY

Weigh and powder 20 tablets. Dissolve as completely as possible using heat a quantity of the powdered tablets containing 0.4 g of Quinidine Sulphate in 40 ml of *acetic anhydride* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 26.10 mg of $(C_{20}H_{24}N_2O_2)_2$, H_2SO_4,$2H_2O$.

STORAGE

Quinidine Sulphate Tablets should be protected from light.

Quinine Bisulphate Tablets

General Notices

Action and use

Antiprotozoal (malaria).

DEFINITION

Quinine Bisulphate Tablets contain Quinine Bisulphate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of quinine bisulphate, $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *diethylamine*, 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) remove any coating from the tablets and extract a quantity of the powdered tablet cores containing 0.1 g of Quinine Bisulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*) and filter. Solution (2) contains 1.0% w/v of *quinine sulphate EPCRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*). Solution (3) contains 1.0% w/v each of *quinidine sulphate EPCRS* and *quinine sulphate EPCRS.* After removal of the plate, allow it to dry in air and spray with 0.05M *ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. Shake a quantity of the powdered tablets containing 0.25 g of Quinine Bisulphate with 25 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*65%*) and filter. Evaporate the filtrate to dryness and wash the residue with 10 ml of *ether*. Filter, wash the residue with 10 ml of *ether* and dry at 60° at a pressure not exceeding 15 Pa for 2 hours. The pH of a 1% w/v solution is 2.8 to 3.4, Appendix V L.

C. Extract a quantity of the powdered tablets containing 0.5 g of Quinine Bisulphate with 10 ml of *water* and filter. The filtrate yields the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of

10 ml of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 348 nm, Appendix II B. Calculate the total content of quinine bisulphate, $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$, in the medium taking 99 as the value of A(1%, 1 cm) at the maximum at 348 nm.

Other cinchona alkaloids

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Bisulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of the filtrate. For solution (2) dissolve 20 mg of *quinine sulphate EPCRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase. Prepare solution (3) in the same manner as solution (2) using *quinidine sulphate EPCRS* in place of *quinine sulphate EPCRS*. Solution (4) is a mixture of equal volumes of solutions (2) and (3). For solution (5) dilute 1 volume of solution (2) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase. Solution (6) contains 0.10% w/v of *thiourea* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5 µm is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with 1M *orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water* and (c) a detection wavelength of 250 nm for recording the chromatogram obtained with solution (6) and 316 nm for the other solutions.

Inject separately 10 µl of each of solutions (3) and (6). If necessary adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with solution (3) the *capacity factor* of the peak due to quinidine is 3.5 to 4.5, V_0 being calculated from the peak due to thiourea in the chromatogram obtained with solution (6). Inject 10 µl of each of solutions (2), (3), (4) and (5). The chromatogram obtained with solution (2) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with solution (3) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with solution (4) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solutions (2) and (3).

The test is not valid unless (a) in the chromatogram obtained with solution (4) the *resolution factor* between the peaks due to quinine and quinidine is at least 1.5 and the *resolution factor* between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (5) is at least 5.

Inject 10 µl of solution (1) and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by *normalisation*, disregarding any peaks the areas of which are less than that of the peak in the chromatogram obtained with solution (5) (0.2%). The content of dihydroquinine is not greater than 10%, the content of any related substance eluting before quinine is not greater than 5% and the content of any other related substance is not greater than 2.5%.

ASSAY

Weigh and powder 20 tablets. Dissolve as completely as possible a quantity of the powdered tablets containing 0.6 g of Quinine Bisulphate in 40 ml of *acetic anhydride* using heat. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 54.86 mg of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$.

STORAGE

Quinine Bisulphate Tablets that are not sugar-coated should be protected from light.

300 mg of Quinine Bisulphate is approximately equivalent to 177.5 mg of anhydrous quinine.

Quinine Dihydrochloride Intravenous Infusion

General Notices

Action and use

Antiprotozoal (malaria).

DEFINITION

Quinine Dihydrochloride Intravenous Infusion is a sterile solution of Quinine Dihydrochloride. It is prepared immediately before use in accordance with the manufacturer′s instructions from Quinine Dihydrochloride Sterile Concentrate.

The intravenous infusion complies with the requirements stated under Parenteral Preparations.

QUININE DIHYDROCHLORIDE STERILE CONCENTRATE

DEFINITION

Quinine Dihydrochloride Sterile Concentrate is a sterile solution of Quinine Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrated Solutions for Injections stated under Parenteral Preparations and with the following requirements.

Content of quinine dihydrochloride, $C_{20}H_{24}N_2O_2,2HCl$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

An almost colourless to light yellow solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel G plate* and a mixture of 10 volumes of *diethylamine*, 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) extract a volume of the concentrate containing 0.1 g of Quinine Dihydrochloride with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (96%)* and filter. Solution (2) contains 1.0% w/v of *quinine sulphate EPCRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (96%)*. Solution (3) contains 1.0% w/v each of *quinidine sulphate EPCRS* and *quinine sulphate EPCRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (96%)*. After removal of the plate, allow it to dry in air and spray with 0.05M *ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH, 1.5 to 3.0, Appendix V L.

Other cinchona alkaloids

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the concentrate being examined diluted, if necessary, with the mobile phase to produce a solution containing 0.2% w/v of Quinine Dihydrochloride. For solution (2) dissolve 20 mg of *quinine sulphate EPCRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase. Prepare solution (3) in the same manner as solution (2) but using *quinidine sulphate EPCRS* in place of *quinine sulphate EPCRS*. Solution (4) is a mixture of equal volumes of solution (2) and solution (3). For solution (5) dilute 1 volume of solution (2) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase. Solution (6) contains 0.10% w/v of *thiourea* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5 µm is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with 1M *orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water* and (c) a detection wavelength of 250 nm for recording the chromatogram obtained with solution (6) and 316 nm for the other solutions.

Inject 10 µl of each of solutions (3) and (6). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with solution (3) the *capacity factor* of the peak due to quinidine is 3.5 to 4.5, V_0 being calculated from the peak due to thiourea in the chromatogram obtained with solution (6). Inject 10 µl of each of solutions (2), (3), (4) and (5). The chromatogram obtained with solution (2) shows a principal peak due to quinine and a peak due to dihydroquinine, with a retention time relative to quinine of about 1.4. The chromatogram obtained with solution (3) shows a principal peak due to quinidine and a peak, due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with solution (4) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solutions (2) and (3).

The test is not valid unless (a) in the chromatogram obtained with solution (4) the *resolution factor* between the peaks due to quinine and quinidine is at least 1.5 and the *resolution factor* between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (5) is at least 5.

Inject 10 µl of solution (1) and record the chromatogram for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by *normalisation*, disregarding any peaks the areas of which are less than that of the peak in the chromatogram obtained with solution (5) (0.2%). The content of dihydroquinine is not greater than 10%, the content of any related substance eluted before quinine is not greater than 5% and the content of any other related substance is not greater than 2.5%.

ASSAY

To a volume containing 0.6 g of Quinine Dihydrochloride, add 20 ml of *water* and 5 ml of 5M *sodium hydroxide*, extract with three 25-ml quantities of *chloroform* and wash the combined extracts with 20 ml of *water*. Dry the chloroform extracts with *anhydrous sodium sulphate*, evaporate to dryness at a pressure of 2 kPa, dissolve the residue in 50 ml of *anhydrous acetic acid* and add 20 ml of *acetic anhydride*. Carry out method I for *non-aqueous titration*, Appendix VIII A, using *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 19.87 mg of $C_{20}H_{24}N_2O_2$,2HCl.

STORAGE

Quinine Dihydrochloride Sterile Concentrate should be protected from light.

LABELLING

The label states (1) 'Quinine Dihydrochloride Sterile Concentrate', (2) that the concentrate must be diluted before administration, (3) that the concentrate should be protected from light.

Quinine Sulphate Tablets

General Notices

Action and use

Antiprotozoal (malaria).

DEFINITION

Quinine Sulphate Tablets contain Quinine Sulphate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of quinine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *diethylamine*, 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) remove any coating from the tablets and extract a quantity of the powdered tablet cores containing 0.1 g of Quinine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*) and filter. Solution (2) contains 1.0% w/v of *quinine sulphate EPCRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*). Solution (3) contains 1.0% w/v each of *quinidine sulphate EPCRS* and *quinine sulphate EPCRS*. After removal of the plate, allow it to dry in air and spray with 0.05M *ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. Extract a quantity of the powdered tablets containing 0.25 g of Quinine Sulphate with 25 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*) and filter. Evaporate the filtrate to dryness and wash the residue with 10 ml of *ether*. Filter and wash the residue with 10 ml of *ether*. Dry the residue at 60° at a pressure not exceeding 15 Pa for 2 hours. The pH of a 1% w/v suspension of the residue is 5.7 to 6.6, Appendix V L.

C. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Sulphate with 20 ml of *water* and filter. The filtrate yields the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 348 nm, Appendix II B. Calculate the total content of quinine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$, in the medium taking 136 as the value of A(1%, 1 cm) at the maximum at 348 nm.

Other cinchona alkaloids

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of the filtrate. For solution (2) dissolve 20 mg of *quinine sulphate EPCRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase. Prepare solution (3) in the same manner as solution (2) using *quinidine sulphate EPCRS* in place of *quinine sulphate EPCRS*. Solution (4) is a mixture of equal volumes of solution (2) and solution (3). For solution (5) dilute 1 volume of solution (2) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase. Solution (6) contains 0.10% w/v of *thiourea* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5 µm is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with 1M *orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water* and (c) a detection wavelength of 250 nm for recording the chromatogram obtained with solution (6) and 316 nm for the other solutions.

Inject 10 µl of each of solutions (3) and (6). If necessary adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with solution (3) the *capacity factor* of the peak due to quinidine is 3.5 to 4.5, V_0 being calculated from the peak due to thiourea in the chromatogram obtained with solution (6). Inject 10 µl of each of solutions (2), (3), (4) and (5). The chromatogram obtained with solution (2) shows a principal peak due to quinine and a peak due to dihydroquinine, with a retention time relative to quinine of about 1.4. The chromatogram obtained with solution (3) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with solution (4) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatogram obtained with solutions (2) and (3).

The test is not valid unless (a) in the chromatogram obtained with solution (4) the *resolution factor* between the peaks due to quinine and quinidine is at least 1.5 and the *resolution factor* between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (5) is at least 5.

Inject 10 µl of solution (1) and record the chromatogram for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by *normalisation*, disregarding any peaks the areas of which are less than that of the peak in the chromatogram obtained with solution (5) (0.2%). The content of dihydroquinine is not greater than 10%, the content of any related substance eluted before quinine is not greater than 5% and the content of any other related substance is not greater than 2.5%.

ASSAY

Weigh and powder 20 tablets and dissolve as completely as possible, using heat, a quantity of the powdered tablets containing 0.4 g of Quinine Sulphate in 40 ml of *acetic anhydride*.

Carry out Method I for *non-aqueous titration*, Appendix VIII A, using *crystal violet solution* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 26.10 mg of $(C_{20}H_{24}N_2O_2)_2$, H_2SO_4,$2H_2O$.

STORAGE

Quinine Sulphate Tablets that are not sugar-coated should be protected from light.

300 mg of Quinine Sulphate is approximately equivalent to 248.6 mg of anhydrous quinine.

Compound Rhubarb Tincture

General Notices

DEFINITION

Rhubarb, in *moderately coarse powder*	100 g
Cardamom Oil	0.40 ml
Coriander Oil	0.03 ml
Glycerol	100 ml
Ethanol (60 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Moisten the Rhubarb with a sufficient quantity of Ethanol (60 per cent) and prepare 850 ml of tincture by *percolation*, Appendix XI F. Add the Cardamom Oil, the Coriander Oil and the Glycerol and sufficient Ethanol (60 per cent) to produce 1000 ml. Mix and filter, if necessary.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

TESTS

Ethanol content

48 to 53% v/v, Appendix VIII F, Method III.

Glycerol

9.0 to 11.0% v/v when determined by the following method. Dilute 20 ml to 100 ml with *water*; to 10 ml of this solution add 100 ml of *water* and 1 g of *activated charcoal* and boil under a reflux condenser for 15 minutes. Filter, wash the filter and charcoal with sufficient *water* to produce 150 ml, add 0.25 ml of *bromocresol purple solution* and neutralise with 0.1M *sodium hydroxide* or 0.05M *sulphuric acid* to the blue colour of the indicator. Add 1.4 g of *sodium periodate*, allow to stand for 15 minutes, add 3 ml of *propane-1,2-diol*, shake and allow to stand for 5 minutes. Add 0.25 ml of *bromocresol purple solution* and titrate with 0.1M *sodium hydroxide VS* to the same blue colour. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 9.210 mg of glycerol. Calculate the percentage v/v of glycerol, taking 1.260 g as its weight per ml .

Relative density

0.958 to 0.977, Appendix V G.

Ramipril Capsules

General Notices

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Ramipril Capsules contain Ramipril.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ramipril, $C_{23}H_{32}N_2O_5$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing 12.5 mg of Ramipril with 50 ml of *acetone,* centrifuge for 10 minutes, filter the supernatant liquid through a 0.45-µm filter, evaporate the filtrate to dryness on a *water bath* and dry the residue for 3 hours at 60°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ramipril (*RS 417*).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of 0.1M *hydrochloric acid* and rotate the paddle at 75 revolutions per minute. Withdraw a sample of the medium and filter immediately through a 0.45-µm glass-fibre filter (Whatman GD/X is suitable), discarding the first 5 ml of filtrate. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the filtered dissolution medium diluted, if necessary, with 0.1M *hydrochloric acid* to produce a solution expected to contain 0.0025 mg of Ramipril per ml. Solution (2) contains 0.00025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil 100-C18 is suitable) and maintained at 28°, (b) as the mobile phase with a flow rate of 1 ml per minute a mixture, adjusted to pH 2.1 with *orthophosphoric acid*, of 420 volumes of *acetonitrile R1* and 580 volumes of a solution containing 1.4% w/v of *sodium perchlorate* and 0.58% w/v of *orthophosphoric acid* adjusted to pH 2.5 with *triethylamine* and (c) a detection wavelength of 210 nm.

Inject 40 µl of each solution.

Calculate the total content of ramipril, $C_{23}H_{32}N_2O_5$, in the medium using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix, with the aid of ultrasound for 10 minutes and stirring, a quantity of the contents of the capsules containing 25 mg of Ramipril with 50 ml of the mobile phase and filter through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 20 volumes with the mobile phase.

(3) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(4) 0.05% w/v of *ramipril BPCRS* and 0.0005% w/v of each of *ramipril impurity A EPCRS*, *ramipril impurity D EPCRS* and *ramipril impurity K BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil 100-C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.0 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 15 µl for each solution.

When the chromatograms are recorded under the prescribed conditions, the retention time of ramipril is about 10 minutes and retention times relative to ramipril are about 0.6 for ramipril impurity K (diketopiperazine acid impurity), about 0.7 for ramipril impurity A (methyl ester impurity) and about 2.6 for ramipril impurity D (diketopiperazine impurity).

MOBILE PHASE

A mixture, adjusted to pH 2.6 with *orthophosphoric acid*, of 350 volumes of *acetonitrile R1* and 680 volumes of a solution adjusted to pH 3.9 with *triethylamine,* containing 1.4% w/v of sodium perchlorate and 0.58% w/v of orthophosphoric acid.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to ramipril impurity K and ramipril impurity A is at least 1.0.

LIMITS

For capsules containing more than 1.25 mg of Ramipril

In the chromatogram obtained with solution (1) the combined area of peaks corresponding to ramipril impurity D and ramipril impurity E is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (6.0%); the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). The sum of the areas of all the *secondary peaks* is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (6.0%).

For capsules containing 1.25 mg or less of Ramipril

In the chromatogram obtained with solution (1) the combined area of peaks corresponding to ramipril impurity D and ramipril impurity E is not greater than 1.6 times the area of the principal peak in the chromatogram obtained with solution (2) (8.0%); the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). The sum of the areas of all the *secondary peaks* is not greater than 1.6 times the area of the principal peak in the chromatogram obtained with solution (2) (8.0%).

Uniformity of content

Capsules containing less than 2 mg of Ramipril comply with the requirements stated under Capsules using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 80 ml of 0.1M *hydrochloric acid* to the contents and shell of one capsule, mix with the aid of ultrasound for 10 minutes and immediately stir magnetically for 15 minutes. Add sufficient 0.1M *hydrochloric acid* to produce 100 ml and filter through a 0.45-µm glass-fibre filter (Whatman GD/X is suitable). Dilute the resulting solution, if necessary, with sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.00025% w/v of Ramipril. Solution (2) contains 0.00025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

The chromatographic procedure described under Dissolution may be used.

Calculate the content of $C_{23}H_{32}N_2O_5$ in each capsule using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

ASSAY

For capsules containing 2 mg or more of Ramipril

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 150 ml of 0.1M *hydrochloric acid* to a quantity of the mixed contents of 20 capsules containing 50 mg of Ramipril, mix with the aid of ultrasound for 10 minutes and immediately stir magnetically for 15 minutes. Add sufficient 0.1M *hydrochloric acid* to produce 200 ml and filter through a 0.45-µm glass-fibre filter (Whatman GD/X is suitable). Dilute the resulting solution with sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.00025% w/v of Ramipril.

(2) 0.00025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{32}N_2O_5$ in the capsules using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

For capsules containing less than 2 mg of Ramipril

Use the average of the 10 individual results obtained in the test for Uniformity of content.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Ramipril.

Ramipril Tablets

General Notices

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Ramipril Tablets contain Ramipril.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ramipril, $C_{23}H_{32}N_2O_5$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 25 mg of Ramipril with 50 ml of *acetone,* centrifuge for 10 minutes, filter the supernatant liquid through a 0.45-µl filter, evaporate the filtrate to dryness on a *water bath* and dry the residue for 3 hours at 60°. The *infrared absorption spectrum* of the residue*,* Appendix II A, is concordant with the *reference spectrum* of ramipril (*RS 417*).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 ml of 0.1M *hydrochloric acid* and rotate the paddle at 75 revolutions per minute. Withdraw a sample of the medium and filter immediately through a 0.45-µm glass-fibre filter (Whatman GD/X is suitable), discarding the first 5 ml of filtrate. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the filtered dissolution medium diluted, if necessary, with 0.1M *hydrochloric acid* to produce a solution expected to contain 0.0025 mg of Ramipril per ml. Solution (2) contains 0.00025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil 100-C18 is suitable), (b) as the mobile phase with a flow rate of 1.0 ml per minute a mixture, adjusted to pH 2.1 with *orthophosphoric acid*, of 420 volumes of *acetonitrile R1* and 580 volumes of a solution containing 1.4% w/v of *sodium perchlorate* and 0.58% w/v of *orthophosphoric acid* adjusted to pH 2.5 with *triethylamine* and (c) a detection wavelength of 210 nm.

Inject 40 µl of each solution.

Calculate the total content of ramipril, $C_{23}H_{32}N_2O_5$, in the medium using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound for 10 minutes, a quantity of the contents of the powdered tablets containing 25 mg of Ramipril with 50 ml of the mobile phase, centrifuge and use the clear supernatant liquid.

(2) Dilute 1 volume of solution (1) to 20 volumes with the mobile phase.

(3) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(4) 0.05% w/v of *ramipril BPCRS* and 0.0005% w/v of each of *ramipril impurity A EPCRS*, *ramipril impurity D EPCRS* and *ramipril impurity K BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil 100-C18 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.0 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 15 µl for each solution.

When the chromatograms are recorded under the prescribed conditions, the retention time of ramipril is about 10 minutes and retention times relative to ramipril are about 0.6 for ramipril impurity K (diketopiperazine acid impurity), about 0.7 for ramipril impurity A (methyl ester impurity) and about 2.6 for ramipril impurity D (diketopiperazine impurity).

MOBILE PHASE

A mixture, adjusted to pH 2.6 with *orthophosphoric acid*, of 350 volumes of *acetonitrile R1* and 680 volumes of a solution adjusted to pH 3.9 with *triethylamine,* containing 1.4% w/v of sodium perchlorate and 0.58% w/v of orthophosphoric acid.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to ramipril impurity K and ramipril impurity A is at least 1.0.

LIMITS

For tablets containing more than 1.25 mg of Ramipril

In the chromatogram obtained with solution (1) the combined area of peaks corresponding to ramipril impurity D and ramipril impurity E is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (6.0%); the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). The sum of the areas of all the *secondary peaks* is not greater than 1.2 times the area of the principal peak in the chromatogram obtained with solution (2) (6.0%).

For capsules containing 1.25 mg or less of Ramipril

In the chromatogram obtained with solution (1) the combined areas of peak corresponding to ramipril impurity D and ramipril impurity E is not greater than 1.6 times the area of the principal peak in the chromatogram obtained with solution (2) (8.0%); the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%). The sum of the areas of all the *secondary peaks* is not greater than 1.6 times the area of the principal peak in the chromatogram obtained with solution (2) (8.0%).

Uniformity of content

Tablets containing less than 2 mg of Ramipril comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 5 ml of 0.1M *hydrochloric acid* to one tablet, mix with the aid of ultrasound for 10 minutes, dilute, if necessary, with sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.025% w/v of Ramipril, centrifuge and use the supernatant liquid. Solution (2) contains 0.025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

The chromatographic procedure described under Dissolution may be used.

Calculate the content of $C_{23}H_{32}N_2O_5$ in each tablet using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

ASSAY

For tablets containing 2 mg or more of Ramipril

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 100 ml of 0.1M *hydrochloric acid* to a quantity of powdered tablets containing 25 mg of Ramipril, mix with the aid of ultrasound for 10 minutes and centrifuge, use the supernatant.

(2) 0.025% w/v of *ramipril BPCRS* in 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{32}N_2O_5$ in the tablets using the declared content of $C_{23}H_{32}N_2O_5$ in *ramipril BPCRS*.

For tablets containing less than 2 mg of Ramipril

Use the average of the 10 individual results obtained in the test for Uniformity of content.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Ramipril.

Ranitidine Injection

General Notices

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulcer disease.

DEFINITION

Ranitidine Injection is a sterile solution of Ranitidine Hydrochloride in Water for Injections. *The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.*

Content of ranitidine, $C_{13}H_{22}N_4O_3S$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. To a volume of the injection containing the equivalent of 25 mg of ranitidine add 20 ml of *methanol*, mix and evaporate to dryness. Add 1 ml of *petroleum spirit* (*boiling range, 60° to 80°*) to the resulting residue, scratch the side of the vessel with a glass rod to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of ranitidine hydrochloride (*RS 311*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

Buffered formulations, pH 6.7 to 7.3; unbuffered formulations, pH 4.5 to 7.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute, if necessary, a volume of the injection with *water* to contain the equivalent of 0.1% w/v of ranitidine.

(2) Dilute 1 volume of solution (1) to 50 volumes with *water.*

(3) Dilute 1 volume of solution (1) to 100 volumes with *water*.

(4) Dilute 1 volume of solution (1) to 200 volumes with *water*.

(5) Dilute 1 volume of solution (3) to 5 volumes with *water*.

(6) Dissolve the contents of a vial of *ranitidine impurity J EPCRS* in 1 ml of solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl amorphous organosilica polymer* (3.5 µm) (Waters XTerra MS C18 is suitable).

(b) Gradient elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Column temperature of 35°.

(e) Detection wavelength of 230 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

Buffer solution

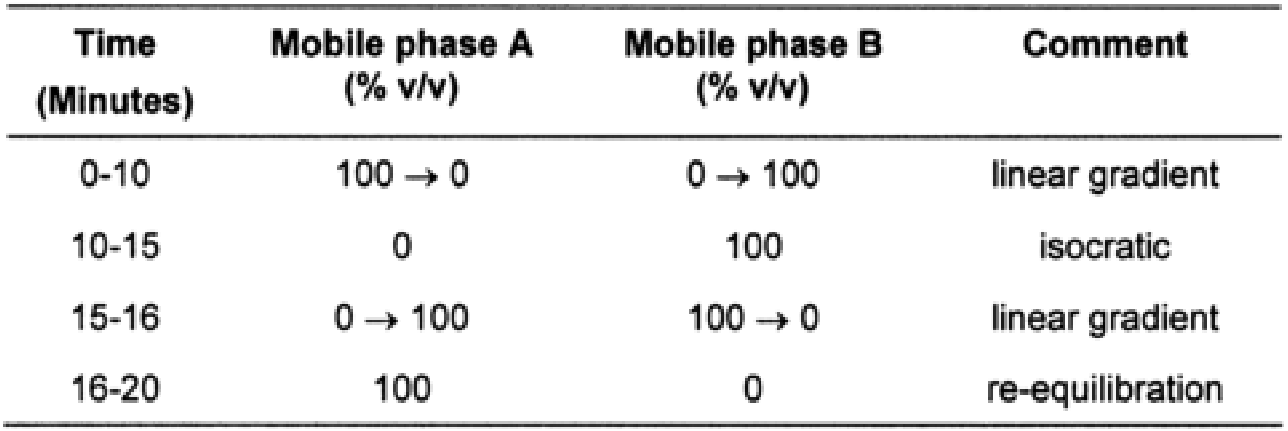
Adjust the pH of 950 ml of 0.05M *potassium dihydrogen orthophosphate to 7.1* by adding *strong sodium hydroxide solution* and dilute to 1 litre.

Mobile phase A

2 volumes of *acetonitrile* and 98 volumes of buffer solution.

Mobile phase B

22 volumes of *acetonitrile* and 78 volumes of buffer solution.



Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	100 → 0	0 → 100	linear gradient
10-15	0	100	isocratic
15-16	0 → 100	100 → 0	linear gradient
16-20	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the two principal peaks is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of not more than one *secondary peak* is greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%);

the area of not more than two other *secondary peaks* is greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.5%);

the area of not more than two further *secondary peaks* is greater than the principal peak in solution (5) (0.2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection with sufficient of the mobile phase to contain the equivalent of 0.01% w/v of ranitidine.

(2) 0.0112% w/v of *ranitidine hydrochloride BPCRS* in mobile phase.

(3) 0.0112% w/v of *ranitidine hydrochloride BPCRS* and 0.0002% w/v of *dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS 1 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 322 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

15 volumes of 0.1M *ammonium acetate* and 85 volumes of *methanol*.

SYSTEM SUITABILITY

The assay is not valid unless the peak due to ranitidine in the chromatogram obtained with solution (3) shows baseline separation from the peak due to dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the injection using the declared content of $C_{13}H_{22}N_4O_3S$ in *ranitidine hydrochloride BPCRS*.

STORAGE

Ranitidine Injection should be protected from light.

LABELLING

The label states (1) the quantity of active ingredient in terms of the equivalent amount of ranitidine; (2) where appropriate, that the injection is buffered.

Ranitidine Oral Solution

General Notices

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulcer disease.

DEFINITION

Ranitidine Oral Solution is a solution of Ranitidine Hydrochloride in a suitable vehicle.
The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ranitidine, $C_{13}H_{22}N_4O_3S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds in position to that in the chromatogram obtained with solution (3).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.7 to 7.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Prepare a solid phase extraction cartridge containing a C_{18} sorbent (Sep-Pak C_{18} cartridges are suitable) by passing 10 ml of *methanol* followed by 20 ml of 0.5M *ammonia* through the cartridge; attach the tip of a suitable syringe to the cartridge. Transfer a weighed quantity of the oral solution containing the equivalent of 10 mg of ranitidine to the barrel of the syringe, add 2 ml of 0.5M *ammonia* to the syringe, insert the plunger and slowly force the mixture through the cartridge, discarding the eluant; repeat with two 4 ml quantities of 0.5M *ammonia* discarding the eluant. Pass two 5-ml quantities of a mixture of 25 volumes of 0.1M *hydrochloric acid* and 75 volumes of *methanol* through the cartridge and collect the eluant; add 40 ml of *absolute ethanol* to the collected eluant, evaporate the resulting solution to dryness at a temperature not exceeding 30° under reduced pressure and dissolve the residue in 1 ml of *methanol*.

(2) Dilute 1 volume of solution (1) to 50 volumes with *methanol*.

(3) 0.0223% w/v of *ranitidine hydrochloride BPCRS* in *methanol*.

(4) 0.0112% w/v of *ranitidine hydrochloride BPCRS* in *methanol*.

(5) 0.0056% w/v of *ranitidine hydrochloride BPCRS* in *methanol*.

(6) 0.1% w/v of *dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine BPCRS* in solution (1).

(7) Prepare a solution in *water* containing 1.12% w/v of *ranitidine hydrochloride BPCRS* and 0.01% w/v of *dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine BPCRS* and repeat the sample preparation procedure applying 1 ml of the resulting solution to the barrel of the syringe.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Mobile phase is a mixture of 4 volumes of *water*, 8 volumes of 18M *ammonia*, 30 volumes of *propan-2-ol* and 50 volumes of *ethyl acetate.*

(c) Develop to 15 cm.

(d) Application volume of 20 µl for each solution.

(e) Remove the plate, allow it to dry thoroughly in air and expose to iodine vapour in a closed chamber until the spots are visible.

SYSTEM SUITABILITY

The test is not valid unless (a) the chromatogram obtained with solution (7) shows two clearly separated spots and the spot due to dimethyl{5-[2-(1-methylamino-2-nitrovinylamino) ethylsulphinylmethyl]furfuryl}amine is of equal intensity to that of the spot in the chromatogram obtained with solution (4) and (b) the chromatogram obtained with solution (6) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (1%);

not more than two other such spots are more intense than the spot in the chromatogram obtained with solution (5) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution containing the equivalent of 10 mg of ranitidine with sufficient of the mobile phase to produce 100 ml.

(2) 0.0112% w/v of *ranitidine hydrochloride BPCRS* in the mobile phase.

(3) 0.0112% w/v of *ranitidine hydrochloride BPCRS* and 0.0002% w/v of *dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS 1 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 2 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 322 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

15 volumes of 0.1M *ammonium acetate* and 85 volumes of *methanol*.

SYSTEM SUITABILITY

The assay is not valid unless the peak due to ranitidine in the chromatogram obtained with solution (3) shows baseline separation from the peak due to dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine.

DETERMINATION OF CONTENT

Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{13}H_{22}N_4O_3S$, weight in volume, using the declared content of $C_{13}H_{22}N_4O_3S$ in *ranitidine hydrochloride BPCRS.*

STORAGE

Ranitidine Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ranitidine.

Ranitidine Tablets

General Notices

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulcer disease.

DEFINITION

Ranitidine Tablets contain Ranitidine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ranitidine, $C_{13}H_{22}N_4O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 25 mg of ranitidine with 5 ml of *methanol* for 5 minutes, filter and evaporate the filtrate to dryness. Add 1 ml of *petroleum spirit* (*boiling range, 60° to 80°*) to the residue, scratch the side of the vessel to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of ranitidine hydrochloride (*RS 311*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing the equivalent of 0.13 g of ranitidine with 100 ml *water* and filter (Whatman No. 42. paper is suitable).

(2) Dilute 1 volume of solution (1) to 200 volumes with mobile phase A.

(3) Dilute 1 volume of solution (1) to 20 volumes with mobile phase A and dilute 3 volumes of the resulting solution to 50 volumes with mobile phase A.

(4) Dissolve the contents of a vial of *ranitidine impurity J EPCRS* in 1 ml of solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl amorphous organosilica polymer* (3.5 µm) (Waters Xterra MS C18 is suitable).

(b) Use gradient elution using the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

Buffer solution

Adjust the pH of 950 ml of 0.05M *potassium dihydrogen orthophosphate* to 7.1 by adding *strong sodium hydroxide solution* and dilute to 1 litre.

Mobile phase A

2 volumes of *acetonitrile* and 98 volumes of the buffer solution.

Mobile phase B

22 volumes of acetonitrile and 78 volumes of the buffer solution.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	100 → 0	0 → 100	linear gradient
10-15	0	100	isocratic
15-16	0 → 100	100 → 0	linear gradient
16-20	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

— the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

— the area of not more than one *secondary peak* is greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.3%);

— the area of not more than three other *secondary peaks* is greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake 10 tablets with 400 ml of the mobile phase until the tablets have completely disintegrated (about 15 minutes), dilute to 500 ml with the mobile phase, filter (Whatman GF/C paper is suitable) and dilute the filtrate with the mobile phase to produce a solution containing the equivalent of 0.01% w/v of ranitidine.

(2) 0.0112% w/v of *ranitidine hydrochloride BPCRS* in the mobile phase.

(3) 0.0112% w/v of *ranitidine hydrochloride BPCRS* and 0.0002% w/v of *dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS 1 is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 322 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

15 volumes of 0.1M *ammonium acetate* and 85 volumes of *methanol*.

SYSTEM SUITABILITY

The assay is not valid unless the peak due to ranitidine in the chromatogram obtained with solution (3) shows baseline separation from the peak due to dimethyl{5-[2-(1-methylamino-2-nitrovinylamino)ethylsulphinylmethyl]furfuryl}amine.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the tablets using the declared content of $C_{13}H_{22}N_4O_3S$ in *ranitidine hydrochloride BPCRS*.

STORAGE

Ranitidine Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of ranitidine.

Ribavirin Nebuliser Solution

General Notices

Ribavirin Solution for Nebulisation

Action and use

Antiviral (Hepatitus C, respiratory syncytial virus).

DEFINITION

Ribavirin Nebuliser Solution is a sterile solution of Ribavirin in Water for Injections. It is prepared by dissolving Ribavirin for Nebulisation in the requisite amount of Water for Injections.

Sterility

Complies with the test *for sterility*, Appendix XVI A.

STORAGE

Ribavirin Nebuliser Solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

The contents of the sealed container when reconstituted comply with the requirements stated under Preparations for Inhalation.

RIBAVIRIN FOR NEBULISATION

DEFINITION

Ribavirin for Nebulisation is a sterile material consisting of Ribavirin with or without excipients. It is supplied in a sealed container.

Content of ribavirin, $C_8H_{12}N_4O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 20 volumes of 0.1M *ammonium chloride* and 90 volumes of *acetonitrile* as the mobile phase. Apply separately to the plate 10 µl of each of two solutions in *water* containing (1) 1% w/v Ribavirin and (2) 1% w/v of *ribavirin BPCRS*. After removal of the plate, allow the spots to dry in air for 15 minutes and spray the plate with mixture of 0.5 ml of *anisaldehyde*, 0.5 ml of *sulphuric acid*, 0.1 ml of *glacial acetic acid* and 9 ml of *ethanol* (*96%*). Heat the plate at 105° for 40 minutes. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using two solutions of the contents of the container in the mobile phase containing (1) 0.050% w/v and (2) 0.000125% w/v of Ribavirin respectively. Solution (3) contains 0.050% w/v of *ribavirin impurity standard BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 7.8 mm) packed with a strong cation-exchange resin of sulphonated, cross-linked *styrene-divinylbenzene co-polymer* in the hydrogen form (7 to 11 µm) (Aminex HPAH is suitable) and maintained at 40°, (b) *water* adjusted to pH 2.5 with *sulphuric acid* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 207 nm. Inject separately 10 µl of each solution. For solution (1) allow the chromatography to proceed for ten times the retention time of the principal peak.

The test is not valid unless the *symmetry factor* for the principal peak in the chromatogram obtained with solution (1) is at least 0.7 and not more than 1.5 and unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *ribavirin impurity standard BPCRS*.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than that of the principal peak in the chromatogram obtained with solution (2) (0.25%) and the sum of the areas of any such peaks is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. For solution (1) reconstitute the contents of one container as instructed on the label using an accurately measured volume of diluent, dilute a suitable volume of the solution to 200 volumes with the mobile phase to produce a solution containing 0.10% w/v of Ribavirin; mix and dilute 5 volumes of the resulting solution to 20 volumes with the mobile phase. Solution (2) contains 0.0025% w/v of *ribavirin BPCRS*.

The chromatographic procedure described under Related substances may be used.

Calculate the content of $C_8H_{12}N_4O_5$ in the container using the declared content of $C_8H_{12}N_4O_5$ in *ribavirin BPCRS*.

LABELLING

The label of the sealed container states (1) the procedure for preparing the solution; (2) the delivery system to be used for the constituted solution; (3) the conditions under which it should be stored.

Rifampicin Capsules

General Notices

Action and use

Rifamycin antituberculosis drug.

DEFINITION

Rifampicin Capsules contain Rifampicin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of rifampicin, $C_{43}H_{58}N_4O_{12}$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 0.15 g of Rifampicin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of rifampicin (*RS 312*).

B. The *light absorption*, Appendix II B, in the range 220 to 500 nm of the final solution obtained in the Assay exhibits four maxima, at 237, 254, 334 and 475 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 ml of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 ml of the medium and filter. Measure the *absorbance* of the filtered sample, diluted if necessary with 0.1M *hydrochloric acid*, at the maximum at 336 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of rifampicin, $C_{43}H_{58}N_4O_{12}$, in the medium taking 263 as the value of A(1%, 1 cm) at the maximum at 336 nm.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using solutions prepared in the solvent mixture described below. To 10 volumes of a 21.01% w/v solution of *citric acid* add 23 volumes of a 13.61% w/v solution of *potassium dihydrogen orthophosphate*, 77 volumes of a 17.42% w/v solution of *dipotassium hydrogen orthophosphate*, 250 volumes of *acetonitrile* and 640 volumes of *water* and mix. Prepare the solutions immediately before use. For solution (1) shake a quantity of the contents of the capsules containing 20 mg of Rifampicin with 10 ml of *acetonitrile*, centrifuge and dilute 5 ml of the clear supernatant liquid to 50 ml with the solvent mixture. For solution (2) dilute 1 volume of solution (1) to 100 volumes. Solution (3) contains 0.00080% w/v of *rifampicin quinone EPCRS*. Solution (4) contains 0.00030% w/v of *rifampicin* N-*oxide BPCRS*. Solution (5) contains 0.00010% w/v of *3-formylrifamycin SV BPCRS*. For solution (6) dilute 1 volume of solution (3) to 4 volumes and mix 1 volume of the resulting solution with 1 volume of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Partisil C8 is suitable), (b) as mobile phase with a flow rate of 1.5 ml per minute a mixture of 35 volumes of *acetonitrile* and 65 volumes of a solution containing 0.1% v/v of *orthophosphoric acid*, 0.19% w/v of *sodium perchlorate*, 0.59% w/v of *citric acid* and 2.09% w/v of *potassium dihydrogen orthophosphate* and (c) a detection wavelength of 254 nm. Inject 20 µl of each solution.

Inject solution (6). Adjust the sensitivity of the detector so that the height of the two principal peaks is not less than half the full-scale of the recorder. The test is not valid unless the *resolution factor* between the two principal peaks is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject solution (1) and allow the chromatography to proceed for at least 3 times the retention time of the peak due to rifampicin. The area of any peak corresponding to rifampicin quinone is not greater than the area of the peak in the chromatogram obtained with solution (3) (4%); the area of any peak corresponding to rifampicin *N*-oxide is not greater than the area of the peak in the chromatogram obtained with solution (4) (1.5%); the area of any peak corresponding to 3-formylrifamycin SV is not greater than the area of the peak in the chromatogram obtained with solution (5) (0.5%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 0.1 g of Rifampicin with 80 ml of *methanol*, add sufficient *methanol* to produce 100 ml and filter. Dilute 2 ml of the filtrate to 100 ml with *phosphate buffer pH 7.4* and measure the *absorbance* of the resulting solution at the maximum at 475 nm, Appendix II B. Calculate the content of $C_{43}H_{58}N_4O_{12}$ taking 187 as the value of A(1%, 1 cm) at 475 nm.

Rifampicin Oral Suspension

General Notices

Action and use

Rifamycin antituberculosis drug.

DEFINITION

Rifampicin Oral Suspension is a suspension of Rifampicin in powder of suitable fineness in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of rifampicin, $C_{43}H_{58}N_4O_{12}$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a quantity containing 0.1 g of Rifampicin add 30 ml of *water* and shake with two 50 ml quantities of *chloroform*. Dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness at a temperature not exceeding 70°. The residue, after washing with 1 ml of *ether* and drying at 70°, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of rifampicin (*RS 312*).

B. Dissolve 10 mg of the residue in 10 ml of *methanol* and dilute 2 ml to 100 ml with *phosphate buffer pH 7.4*. The *light absorption* of the resulting solution, Appendix II B, in the range 240 to 500 nm exhibits three maxima, at 254, 334 and 475 nm.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using solutions prepared in the solvent mixture described below. To 10 volumes of a 21.01% w/v solution of *citric acid* add 23 volumes of a 13.61% w/v solution of *potassium dihydrogen orthophosphate*, 77 volumes of a 17.42% w/v solution of *dipotassium hydrogen orthophosphate*, 250 volumes of *acetonitrile* and 640 volumes of *water* and mix. Prepare the solutions immediately before use. For solution (1) add 5 ml of *water* to a quantity of the oral suspension containing 20 mg of Rifampicin and extract with four 10 ml quantities of *dichloromethane*, filter the combined extracts and evaporate to dryness at a temperature not exceeding 40°. Dissolve the residue in 10 ml of *acetonitrile* and dilute 5 ml of the solution to 50 ml with the solvent mixture. For solution (2) dilute 1 volume of solution (1) to 100 volumes. Solution (3) contains 0.00030% w/v of *rifampicin quinone EPCRS*. Solution (4) contains 0.00020% w/v of *rifampicin* N*-oxide BPCRS*. Solution (5) contains 0.0010% w/v of *3-formylrifamycin SV BPCRS*. For solution (6) dilute 1 volume of solution (3) to 1.5 volumes and mix 1 volume of the resulting solution with 1 volume of solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Partisil C8 is suitable), (b) as mobile phase with a flow rate of 1.5 ml per minute a mixture of 35 volumes of *acetonitrile* and 65 volumes of a solution containing 0.1% v/v of *orthophosphoric acid*, 0.19% w/v of *sodium perchlorate*, 0.59% w/v of *citric acid* and 2.09% w/v of *potassium dihydrogen orthophosphate* and (c) a detection wavelength of 254 nm. Inject 20 µl of each solution.

Inject solution (6). Adjust the sensitivity of the detector so that the height of the two principal peaks is not less than half the full-scale of the recorder. The test is not valid unless the *resolution factor* between the two principal peaks is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject solution (1) and allow the chromatography to proceed for at least 3 times the retention time of the peak due to rifampicin. The area of any peak corresponding to rifampicin quinone is not greater than the area of the peak in the chromatogram obtained with solution (3) (1.5%) ; the area of any peak corresponding to rifampicin *N*-oxide is not greater than the area of the peak in the chromatogram obtained with solution (4) (1%); the area of any peak corresponding to 3-formylrifamycin SV is not greater than the area of the peak in the chromatogram obtained with solution (5) (5%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%). Disregard any peaks with retention times lower than that of the peak due to rifampicin quinone.

Acidity

pH, 4.2 to 4.8, Appendix V L.

ASSAY

Dilute a weighed quantity containing 0.4 g of Rifampicin to 500 ml with *methanol*, mix thoroughly, dilute 2 ml to 100 ml with *phosphate buffer pH 7.4* and measure the *absorbance* of the resulting solution at the maximum at 475 nm, Appendix II B. Calculate the content of $C_{43}H_{58}N_4O_{12}$ taking 187 as the value of A(1%, 1 cm) at 475 nm. Determine the *weight per ml* of the oral suspension, Appendix V G, and calculate the content of $C_{43}H_{58}N_4O_{12}$, weight in volume.

Ritodrine Injection

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Ritodrine Injection is a sterile solution of Ritodrine Hydrochloride in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ritodrine hydrochloride, $C_{17}H_{21}NO_3,HCl$

93.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a suitable volume of the injection with sufficient *methanol* (*30%*) to produce a solution containing 0.010% w/v of Ritodrine Hydrochloride. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 275 nm and a shoulder at about 280 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute, if necessary, a volume of the injection with sufficient of the mobile phase to produce a solution containing 0.10% w/v of Ritodrine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 50 volumes with the mobile phase. For solution (3) heat a solution containing 0.10% w/v of *ritodrine hydrochloride BPCRS* in the mobile phase containing 5.6% v/v of *sulphuric acid* for 2 hours at 85°. Cool and mix 10 volumes of this solution with 8 volumes of a 10% w/v solution of *sodium hydroxide* (generation of *threo*-diastereoisomer).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of a solution containing 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water* and 300 ml of *methanol* adjusted to pH 3.0 with an 85% v/v solution of *orthophosphoric acid* and (c) a detection wavelength of 275 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks (ritodrine and the *threo*-diastereoisomer) is at least 1.5.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (4%), not more than one such peak has an area greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%), not more than one such peak has an area greater than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of all such peaks is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing 0.02% w/v of Ritodrine Hydrochloride. Solution (2) contains 0.02% w/v of *ritodrine hydrochloride BPCRS* in the mobile phase. For solution (3) heat a solution containing 0.1% w/v of *ritodrine hydrochloride BPCRS* in the mobile phase containing 5.6% v/v of *sulphuric acid* for 2 hours at 85°. Cool and mix 10 volumes with 8 volumes of a 10% w/v solution of *sodium hydroxide* (generation of *threo*-diastereoisomer).

The chromatographic procedure described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks (ritodrine and the *threo*-diastereoisomer) is at least 1.5.

Calculate the content of $C_{17}H_{21}NO_3,HCl$ in the injection from the chromatograms obtained and from the declared content of $C_{17}H_{21}NO_3,HCl$ in *ritodrine hydrochloride BPCRS*.

STORAGE

Ritodrine Injection should be protected from light.

Ritodrine Tablets

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Ritodrine Tablets contain Ritodrine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ritodrine hydrochloride, $C_{17}H_{21}NO_3,HCl$

93.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 10 mg of Ritodrine Hydrochloride with 30 ml of *methanol* for 20 minutes, filter (Whatman GF/C is suitable) and to 15 ml of the filtrate add sufficient *water* to produce 50 ml. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum at 275 nm and a shoulder at about 280 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Ritodrine Hydrochloride in 50 ml of the mobile phase for 5 minutes, add sufficient mobile phase to produce 100 ml, mix and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. For solution (3) dissolve about 20 mg of *ritodrine hydrochloride BPCRS* in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and sufficient of the mobile phase to produce 100 ml, mix and heat at a temperature of 85° for 2 hours. Cool to room temperature, carefully mix 10 ml of the cooled solution with 8 ml of a 10% w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*-diastereoisomer).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of a solution containing 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water* and 300 ml of *methanol* adjusted to pH 3.0 with an 85% v/v solution of *orthophosphoric acid* and (c) a detection wavelength of 275 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks (ritodrine and the *threo*-diastereoisomer) is at least 1.5.

In the chromatogram obtained with solution (1), identify any peaks corresponding to tyramine (relative retention time to ritodrine, 0.3), *threo*-diastereoisomer (1.15) and 'aminoketone' (2.3). In the chromatogram obtained with solution (1) the area of any peaks corresponding to tyramine and the *threo*-diastereoisomer is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1% of each), the area of any peak corresponding to 'aminoketone' is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1% [relative response to ritodrine, 5]). The degradation products 4-hydroxybenzoic acid and 4-hydroxybenzaldehyde are formed in equimolar amounts with tyramine.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Ritodrine Hydrochloride in 50 ml of the mobile phase for 5 minutes, add sufficient of the mobile phase to produce 100 ml, mix and filter. Solution (2) contains 0.02% w/v of *ritodrine hydrochloride BPCRS* in the mobile phase. For solution (3) dissolve about 20 mg of *ritodrine hydrochloride BPCRS* in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and sufficient of the mobile phase to produce 100 ml, mix and heat at a temperature of 85° for 2 hours. Cool to room temperature, carefully mix 10 ml of the cooled solution with 8 ml of a 10% w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*-diastereoisomer).

The chromatographic procedure described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks (ritodrine and the *threo*-diastereoisomer) is at least 1.5.

Calculate the content of $C_{17}H_{21}NO_3$,HCl in the tablets from the chromatograms obtained and from the declared content of $C_{17}H_{21}NO_3$,HCl in *ritodrine hydrochloride BPCRS*.

STORAGE

Ritodrine Tablets should be protected from light.

Compound Sodium Bicarbonate Tablets

General Notices

Soda Mint Tablets

DEFINITION

Compound Sodium Bicarbonate Tablets contain, in each, 300 mg of Sodium Bicarbonate. They have a peppermint flavour.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of total carbonate

275 to 325 mg, calculated as $NaHCO_3$.

IDENTIFICATION

A. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

B. The powdered tablets yield the reactions characteristic of *bicarbonates*, Appendix VI.

TESTS

Carbonate

Dissolve 2.5 g of the powder prepared for use in the Assay in 50 ml of *carbon dioxide-free water* . The pH of the resulting solution is not more than 8.6, Appendix V L.

Disintegration

The requirement for Disintegration does not apply to Compound Sodium Bicarbonate Tablets.

ASSAY

Weigh and powder 20 tablets. Dissolve 1 g of the powder in 20 ml of *water* and titrate with 0.5M *hydrochloric acid VS* using *methyl orange solution* as indicator. Each ml of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

LABELLING

The label states that the tablets should be allowed to dissolve slowly in the mouth.

Compound Sodium Chloride Mouthwash

General Notices

DEFINITION

Compound Sodium Chloride Mouthwash contains 1% w/v of Sodium Bicarbonate and 1.5% w/v of Sodium Chloride in a suitable vehicle with a flavour of peppermint.

Extemporaneous preparation

The following formula applies.

Sodium Bicarbonate	10 g
Sodium Chloride	15 g
Concentrated Peppermint Emulsion	25 ml
Double-strength Chloroform Water	500 ml
Water	Sufficient to produce 1000 ml

The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$

0.95 to 1.05% w/v.

Content of sodium chloride, NaCl

1.42 to 1.58% w/v.

ASSAY

For sodium bicarbonate

Titrate 20 ml with 0.1M *hydrochloric acid VS* using *methyl orange-xylene cyanol FF solution* as indicator. Each ml of 0.1M *hydrochloric acid VS* is equivalent to 8.401 mg of $NaHCO_3$.

For sodium chloride

To 10 ml add 10 ml of *water* and carry out the method for *ion-selective potentiometry*, Appendix VIII E, using 0.1M *silver nitrate VS*. Each ml of 0.1M *silver nitrate VS* is equivalent to 5.844 mg of NaCl.

Compound Sodium Chloride Mouthwash should be diluted with an equal volume of warm water before use.

Compound Sodium Lactate Intravenous Infusion

General Notices

Compound Sodium Lactate Injection; Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection

DEFINITION

Compound Sodium Lactate Intravenous Infusion is a sterile solution containing 0.32% w/v of sodium lactate with 0.6% w/v of Sodium Chloride, 0.04% w/v of Potassium Chloride and 0.027% w/v of Calcium Chloride Dihydrate in Water for Injections. It may be prepared from Sodium Lactate Solution or from Lactic Acid.

The intravenous infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of sodium, Na

0.27 to 0.32% w/v.

Content of potassium, K

0.019 to 0.022% w/v.

Content of total chloride, Cl

0.37 to 0.42% w/v.

Content of calcium chloride dihydrate, $CaCl_2,2H_2O$

0.025 to 0.029% w/v.

Content of lactate, calculated as $C_3H_6O_3$

0.23 to 0.28% w/v.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. When warmed with *potassium permanganate* , yields acetaldehyde.

B. The residue obtained by evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged with reddish purple.

C. Yields reaction C characteristic of *calcium salts* , Appendix VI.

TESTS

Acidity or alkalinity

pH, 5.0 to 7.0, Appendix V L.

Bacterial endotoxins

The endotoxin limit concentration is 0.25 IU per ml, Appendix XIV C.

ASSAY

For Na

Prepare a suitable dilution in *water* and determine by *atomic emission spectrophotometry* , Appendix II D, measuring at 589 nm and using *sodium standard solution* (*200 ppm Na*), suitably diluted with *water*, for the standard solutions.

For K

Prepare a suitable dilution in *water* and determine by *atomic emission spectrophotometry* , Appendix II D, measuring at 767 nm and using *potassium standard solution* (*600 ppm K*), suitably diluted with *water*, for the standard solutions.

For total chloride

To 20 ml add 30 ml of *water*, 50 ml of 0.1M *silver nitrate VS* and 2 ml of *nitric acid* , filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with 0.1M *ammonium thiocyanate VS* using *ammonium iron* (*III*) *sulphate solution R2* as indicator. Each ml of 0.1M *silver nitrate VS* is equivalent to 3.545 mg of total Cl.

For calcium chloride dihydrate

To 50 ml add 5 ml of 0.01M *magnesium sulphate VS* and 5 ml of *ammonia buffer pH 10.9* and titrate with 0.01M *disodium edetate VS* using *mordant black 11 triturate* as indicator. From the volume of 0.01M *disodium edetate VS* required subtract the volume of 0.01M *magnesium sulphate VS* added. Each ml of the remainder is equivalent to 1.470 mg of $CaCl_2$, $2H_2O$.

For lactate, calculated as $C_3H_6O_3$

Carry out the method for *liquid chromatography* , Appendix III D, using the following solutions. Solution (1) contains 0.28% w/v of *lithium lactate BPCRS* in the mobile phase. For solution (2) use the infusion.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of 90 volumes of *water* and 10 volumes of a 2% v/v solution of *octylamine* in *acetonitrile* , the pH of the final mixture being adjusted to 7.0 with a 10% v/v solution of *orthophosphoric acid* , and (c) a detection wavelength of 210 nm.

Calculate the content of lactate as $C_3H_6O_3$ in the infusion using the declared equivalent content of $C_3H_6O_3$ in *lithium lactate BPCRS* .

LABELLING

The label states (1) that solutions containing visible solid particles must not be used; (2) that the Intravenous Infusion contains, in millimoles per litre, the following approximate amounts of the ions present: sodium, 131; potassium, 5; calcium, 2; bicarbonate (as lactate), 29 and chloride, 111.

Compound Sodium Picosulfate Powder for Oral Solution

General Notices

Sodium Picosulfate Oral Powder

DEFINITION

Compound Sodium Picosulfate Powder for Oral Solution contains Sodium Picosulfate, Light Magnesium Oxide and Anhydrous Citric Acid. On reconstitution the powder produces Sodium Picosulphate and Magnesium Citrate in solution; heat is evolved during the reconstitution.

The powder complies with the requirements stated under Powders and Granules for Oral Solutions and Suspensions under Oral Liquids and with the following requirements.

Content of sodium picosulfate, $C_{18}H_{13}NNa_2O_8S_2$

90.0 to 110.0% of the stated amount.

Content of light magnesium oxide, MgO

90.0 to 110.0% of the stated amount.

Content of anhydrous citric acid, $C_6H_8O_7$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak in the chromatogram obtained with solution (2).

B. Dissolve the contents of one sachet in *water*; heat is evolved.

C. Add 100 ml of *water* to the contents of one sachet and allow to cool. Centrifuge and dilute 10 ml of the supernatant liquid to 100 ml with *water*. 5 ml of the resulting solution yields reaction A characteristic of *citrates* , Appendix VI.

D. Place about 1 g of the oral powder in a silica crucible, moisten with *sulphuric acid* , ignite gently, again moisten with *sulphuric acid* and ignite at 800° until a carbon-free residue is obtained. Disperse about 0.1 g of the residue obtained in 10 ml of *water*, adjust the pH to about 3 with 2M *sulphuric acid* , shake and filter. The filtrate yields the reactions characteristic of *magnesium salts* , Appendix VI.

TESTS

Impurity A

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse the contents of one sachet in about 70 ml of *water*, allow to stand until effervescence has ceased, cool to room temperature, add sufficient *water* to produce a solution containing 0.01% w/v Sodium Picosulphate, mix and centrifuge; use the clear supernatant liquid. Solution (2) contains 0.0002% w/v of *sodium picosulfate BPCRS* in *water*. For solution (3) dissolve 10 mg of *sodium picosulfate BPCRS* in 2 ml of 0.1M *hydrochloric acid*, bring rapidly to the boil and heat for 1 minute. Cool in ice-water, add 2 ml of 0.1M *sodium hydroxide* and dilute to 10 ml with the mobile phase. Dilute 2 volumes to 50 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) a guard column (2.5 cm × 4.5 mm) packed with *octadecylsilyl silica gel for chromatography*, (c) as the mobile phase with a flow rate of 1.5 ml per minute a mixture of 15 volumes of *acetonitrile* and 85 volumes of *0.067* M *mixed phosphate buffer pH 7.0* and (d) a detection wavelength of 263 nm.

Inject 50 µl of each solution. The test is not valid unless the chromatogram obtained with solution (3) closely resembles the appropriate reference chromatogram supplied with *sodium picosulphate BPCRS*.

In the chromatogram obtained with solution (1) the area of any peak due to impurity A (4-[(pyridin-2-yl)(4-hydroxyphenyl)methyl] phenyl sodium sulphate) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content

Complies with the requirements stated under Powders with respect to the content of Sodium Picosulfate using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve the contents of one sachet in about 70 ml of *water*, allow to stand until effervescence has ceased, cool to room temperature, add sufficient *water* to produce 100 ml, mix and centrifuge; use the clear supernatant liquid. Solution (2) contains 0.01% w/v of *sodium picosulfate BPCRS* in *water*.

The chromatographic procedure described under Impurity A may be used.

Calculate the content of $C_{18}H_{13}NNa_2O_8S_2$ using the declared content of $C_{18}H_{13}NNa_2O_8S_2$ in *sodium picosulfate BPCRS.*

ASSAY

For sodium picosulfate

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For light magnesium oxide

To a quantity of the powder containing 30 mg of Light Magnesium Oxide add 4 ml of 3M *hydrochloric acid*, dissolve by warming on a water bath, cool and add 50 ml of *water*. Carry out the *complexometric titration of magnesium*, Appendix VIII D, beginning at the words 'To the resulting solution... ', but using 0.05M *disodium edetate VS* as titrant. Each ml of 0.05M *disodium edetate VS* is equivalent to 2.015 mg of MgO.

For anhydrous citric acid

During the titration take care to exclude carbon dioxide. Dissolve a quantity of the powder containing 0.8 g of Anhydrous Citric Acid in 60 ml of *dimethylformamide* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using 0.1M *tetrabutylammonium hydroxide VS* as titrant, determining the end point potentiometrically and taking the second inflection as the end point. Each ml of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 96.05 mg of $C_6H_8O_7$.

LABELLING

The label states (1) the total weights, in grams, of the constituents in each sachet and (2) that heat is evolved when the contents of the sachet are added to water.

IMPURITIES

4-[(pyridin-2-yl)(4-hydroxyphenyl)methyl]phenyl sodium sulphate.

Dilute Sodium Hypochlorite Solution

General Notices

DEFINITION

Dilute Sodium Hypochlorite Solution is an aqueous *cutaneous solution* of sodium hypochlorite containing 1% of available chlorine. It may contain suitable stabilising agents and Sodium Chloride.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of available chlorine, Cl

0.90 to 1.10% w/w.

ASSAY

Add 10 ml of the solution to a mixture of 50 ml of *water*, 1 g of *potassium iodide* and 12.5 ml of 2M *acetic acid* . Titrate with 0.1M *sodium thiosulphate VS* using *starch solution* as indicator. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 3.545 mg of Cl. Determine the *weight per ml* of the solution, Appendix V G, and calculate the percentage w/w of available chlorine.

STORAGE

Dilute Sodium Hypochlorite Solution should be kept in a well-filled container and protected from light. It should be stored at a temperature not exceeding 20° and away from acids.

LABELLING

The label states (1) the date after which the solution is not intended to be used; (2) the conditions under which it should be stored.

The label indicates the pharmaceutical form as 'cutaneous solution'.

Gastro-resistant Sodium Valproate Tablets

General Notices

Enteric-coated Sodium Valproate Tablets

DEFINITION

Gastro-resistant Sodium Valproate Tablets contain Sodium Valproate. They are covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of sodium valproate, $C_8H_{15}NaO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.5 g of Sodium Valproate with 10 ml of *water* and centrifuge. Acidify 5 ml of the supernatant liquid with 2M *sulphuric acid* , shake with 25 ml of *chloroform* and wash the chloroform layer with 5 ml of *water*. Dry by shaking with *anhydrous sodium sulphate* , filter and evaporate the chloroform to dryness. The *infrared absorption spectrum* of a thin film of the residue, Appendix II A, is concordant with the *reference spectrum* of valproic acid (*RS 358*).

TEST

Related substances

Carry out the method for *gas chromatography* , Appendix III B, using the following solutions. Solution (1) contains 0.020% w/v of *octanoic acid* (internal standard) in *dichloromethane* . For solution (2) shake a quantity of the powdered tablets containing 0.50 g of Sodium Valproate with 10 ml of *water*, acidify with 2M *sulphuric acid* and shake with three 20 ml quantities of *dichloromethane* . Wash the combined dichloromethane extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate* , filter and evaporate the filtrate to a volume of about 8 ml at a temperature not exceeding 30° using a rotary evaporator and dilute to 10 ml with dichloromehane. For solution (3) shake a quantity of the powdered tablets containing 0.50 g of Sodium Valproate with 10 ml of a 0.020% w/v solution of the internal standard in 0.1M *sodium hydroxide* and continue as described for solution (2), beginning at the words 'acidify with 2M *sulphuric acid* ...'.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 15% w/w of free fatty acid phase and 1% w/w of *orthophosphoric acid* and maintained at 170°.

In the chromatogram obtained with solution (3) the sum of the areas of any *secondary peaks* is not greater than the area of the peak due to the internal standard (0.4%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) shake 0.1 g of *sodium valproate BPCRS* with 10 ml of a 1% w/v solution of *octanoic acid* (internal standard) in 0.1M *sodium hydroxide*, acidify with 2M *sulphuric acid* and shake with three 20-ml quantities of *dichloromethane*. Wash the combined dichloromethane extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and wash the filter paper with 20 ml of *dichloromethane*. To 50 ml of the filtrate add sufficient *dichloromethane* to produce 100 ml. Prepare solution (2) in the same manner as solution (3) but using 10 ml of a solution of 0.1M *sodium hydroxide* in place of the internal standard solution. For solution (3) shake a quantity of the powdered tablets containing 0.1 g of Sodium Valproate with 10 ml of a 1% w/v solution of the internal standard in 0.1M *sodium hydroxide* and continue as described for solution (1) beginning at the words 'acidify with 2M *sulphuric acid* ... '.

The chromatographic conditions described under the test for Related substances may be carried out.

Calculate the content of $C_8H_{15}NaO_2$ in the tablets using the declared content of $C_8H_{15}NaO_2$ in *sodium valproate BPCRS*.

LABELLING

The label states that the tablets should be swallowed whole and not chewed.

Gastro-resistant Sulfasalazine Tablets

General Notices

Enteric-coated Sulfasalazine Tablets

Action and use

Aminosalicylate; treatment of ulcerative colitis.

DEFINITION

Gastro-resistant Sulfasalazine Tablets contain Sulfasalazine. They are covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of sulfasalazine, $C_{18}H_{14}N_4O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract for 30 minutes with the aid of ultrasound a quantity of the powdered tablets containing 0.2 g of Sulfasalazine with 100 ml of *methanol* , filter, evaporate the filtrate to dryness and dry at 35° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of sulfasalazine *(RS 429)* .

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Related substances

Carry out the method for *liquid chromatography* , Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Sulfasalazine with 100 ml of 0.1M *ammonia* for 30 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *ammonia* .

(3) Contains 0.001% w/v of *sulfasalazine derivative for resolution EPCRS* in solution (2).

(4) Contains 0.001% w/v of *sulfasalazine EPCRS* in 0.1M *ammonia* .

(5) Dilute 1 volume of solution (2) to 20 volumes with 0.1M *ammonia* .

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 320 nm.

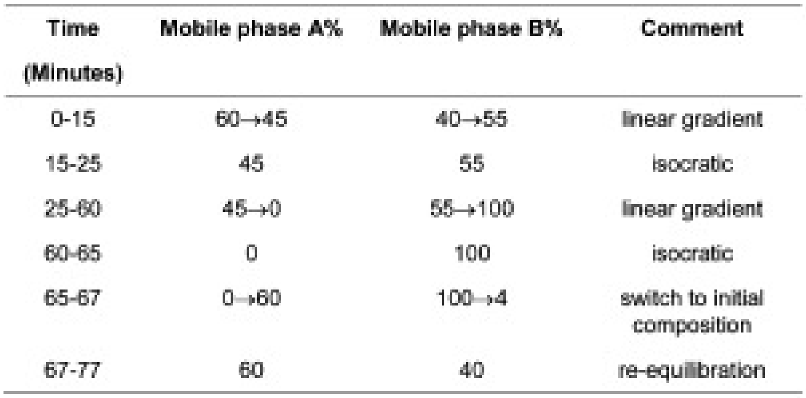
(f) Inject 20 µl of each solution.

MOBILE PHASE A

A solution containing 0.013% w/v of *sodium dihydrogen orthophosphate* and 0.25% w/v of *sodium acetate* adjusted to pH 4.8 with *glacial acetic acid* .

MOBILE PHASE B

Mix 1 volume of mobile phase A with 4 volumes of *methanol* .



Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-15	60→45	40→55	linear gradient
15-25	45	55	isocratic
25-60	45→0	55→100	linear gradient
60-65	0	100	isocratic
65-67	0→60	100→4	switch to initial composition
67-77	60	40	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks corresponding to sulfasalazine and sulfasalazine derivative for resolution is at least 3.0.

When the chromatograms are recorded in the prescribed conditions, the approximate retention times relative to sulfasalazine are: impurity A, 2.00; impurity B, 1.85; impurity C, 0.80; impurity D, 1.90; impurity E, 1.63; impurity F, 0.85; impurity G, 1.39; impurity H, 0.16; impurity I, 0.28.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than 4 times the area of the peak in the chromatogram obtained with solution (2) (4%).

Disregard any peak with a retention time shorter than 6 minutes (corresponding to salicylic acid and sulfapyridine) and any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.05%).

Salicylic acid and sulfapyridine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Sulfasalazine with 100 ml of 0.1M *ammonia* for 30 minutes, centrifuge and use the supernatant liquid.

(2) Prepare a solution containing 0.05% w/v of *salicylic acid* and 0.05% w/v of s*ulfapyridine EPCRS* in 0.1M *ammonia* and dilute 1 volume of this solution to 50 volumes with 0.1M *ammonia*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use Isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 300 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

A mixture of 70 volumes of mobile phase A described in the test for Related substances and 30 volumes of mobile phase B described in the test for Related substances.

SYSTEM SUITABILITY

The retention time of salicylic acid is about 6 minutes and that of sulfapyridine, about 7 minutes. The test is not valid unless the *resolution factor* between the peaks corresponding to salicylic acid and sulfapyridine is at least 2.

LIMITS

Allow the chromatography to proceed for 10 minutes. In the chromatogram obtained with solution (1) the areas of any peaks corresponding to salicylic acid and sulfapyridine are not greater than 0.5 times the areas of the corresponding peaks in the chromatogram obtained with solution (2) (0.5% of each).

Dissolution

Comply with the requirements for 'Monographs of the British Pharmacopoeia' in the *dissolution test for tablets and capsules* , Appendix XII B1, using Apparatus 2. Use as the, and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 ml of the medium, filter and dilute a suitable volume of the filtrate with the dissolution medium to produce a solution containing 0.005% w/v of Sulfasalazine. Measure the *absorbance* of this solution, Appendix II B, at 406 nm using dissolution medium in the reference cell. Calculate the total content of $C_{18}H_{14}N_4O_5S$ in the medium from the *absorbance* of a 0.005% w/v solution of *sulfasalazine EPCRS* in dissolution medium and using the declared content of $C_{18}H_{14}N_4O_5S$ in *sulfasalazine EPCRS* .

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.15 g of Sulfasalazine with about 50 ml of 0.1M *sodium hydroxide* , add sufficient of the same solvent to produce 100 ml, filter and discard the first 20 ml of filtrate. Dilute 5 ml of the filtrate with 750 ml of *water*, add 20 ml of 0.1M *acetic acid* , mix and add sufficient *water* to produce 1000 ml. Measure the *absorbance* of this solution at the maximum at 359 nm, Appendix II B. Calculate the content of $C_{18}H_{14}N_4O_5S$ in the tablets from the *absorbance* of a standard solution prepared in the same manner using 0.15 g of *sulfasalazine EPCRS* and using the declared content of $C_{18}H_{14}N_4O_5S$ in *sulfasalazine EPCRS* .

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Sulfasalazine.

Invert Syrup

General Notices

DEFINITION

Invert Syrup is a mixture of glucose and fructose prepared by hydrolysing a 66.7% w/w solution of Sucrose with a suitable mineral acid, such as hydrochloric acid, and neutralising the resulting solution using, for example, calcium carbonate or sodium carbonate. The degree of inversion is at least 95%.

The syrup complies with the requirements stated under Oral Liquids and with the following requirements.

Content of reducing sugars, expressed as invert sugar

Not less than 67.0% w/w.

CHARACTERISTICS

A clear, colourless to pale straw-coloured syrupy liquid.

Miscible with *water*, producing a clear solution; it dissolves in *ethanol (96%)* with the formation of an insoluble residue.

IDENTIFICATION

A. Heat 1 g with 10 ml of *water* and 5 ml of *cupri-tartaric solution*. A red precipitate is produced.

B. A solution in *water* is laevorotatory.

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Arsenic

To 4.0 g add 50 ml of *water* and 10 ml of *brominated hydrochloric acid*, allow to stand for 5 minutes and remove the excess of bromine by adding *tin(II) chloride solution AsT* and dilute to 100 ml with *water*. 25 ml of the resulting solution complies with the *limit test for arsenic*, Appendix VII (1 ppm).

Lead

Prepare two solutions as follows. For solution (1) add 5 ml of 6M *acetic acid* to 12 g of the syrup. For solution (2) add 5 ml of 6M *acetic acid* and 2 ml of *lead standard solution (10 ppm Pb)* to 2.0 g of the syrup. Make solutions (1) and (2) alkaline with 5M *ammonia*, if necessary, and to each add 1 ml of *potassium cyanide solution PbT*. The solutions should not be more than faintly opalescent. If the colours of the solutions differ, equalise by the addition of a few drops of a highly diluted solution of burnt sugar or other non-reactive substance. Dilute each solution to 50 ml with *water*, add 0.1 ml of a 10% w/v solution of *sodium sulphide* to each and mix thoroughly. When viewed against a white background, the colour produced in solution (1) is not more intense than that produced in solution (2) (2 ppm).

Refractive index

1.4608 to 1.4630, Appendix V E.

Sulphur dioxide

Not more than 70 ppm, Appendix IX B.

Weight per ml

1.338 to 1.344 g, Appendix V G.

Sulphated ash

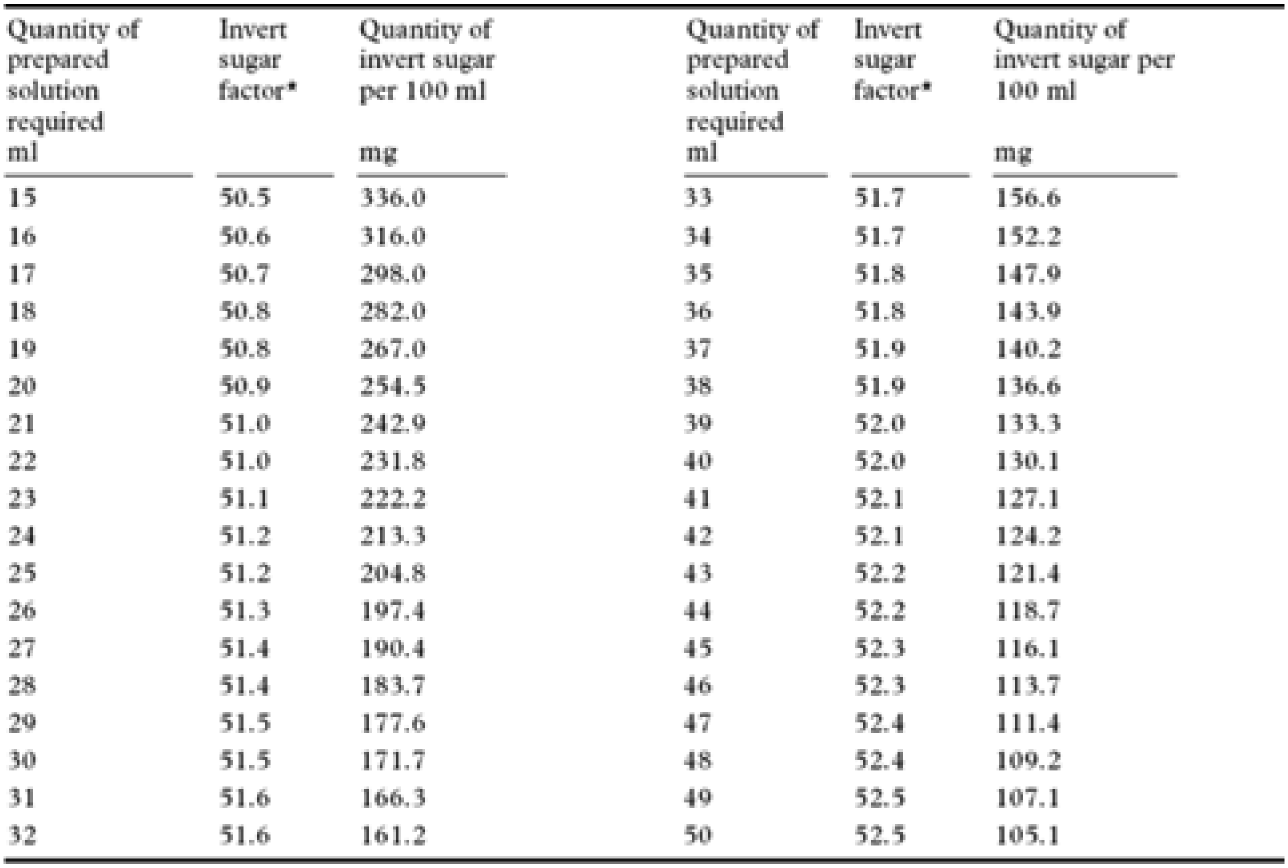
Not more than 0.1%, Appendix IX A.

ASSAY

Dilute the syrup so that the volume of the diluted solution required in the following method is between 15 and 50 ml. Add 10.00 ml of *cupri-tartaric solution R1* to a 300 ml conical flask, add from a burette 15 ml of the diluted solution, heat to boiling over wire gauze covered with insulating material and continue adding the diluted solution in quantities of about 5 ml at 15-second intervals until the colour of the mixture indicates that the reduction appears to be almost complete. Boil for 2 minutes, add 0.2 ml of a 1% w/v solution of *methylene blue* and continue the titration until the blue colour is discharged. Repeat the operation, but, before heating, add almost the full quantity of the diluted solution required to reduce all the copper and then boil moderately for 2 minutes. Without removing the flask from either the gauze or the flame during the remainder of the titration, add 0.2 ml of the methylene blue solution and continue the titration so that it is just complete in a total boiling time of exactly 3 minutes; the end point is indicated by the disappearance of the blue colour, the solution becoming orange. From the Table calculate the content of reducing sugars (expressed as invert sugar) in 100 ml of the diluted solution and hence the percentage weight in weight in the substance being examined.

STORAGE

Invert Syrup should be stored at a temperature of 35° to 45°.



Quantity of prepared solution required ml	Invert sugar factor*	Quantity of invert sugar per 100 ml mg	Quantity of prepared solution required ml	Invert sugar factor*	Quantity of invert sugar per 100 ml mg
15	50.5	336.0	33	51.7	156.6

* mg of invert sugar corresponding to 10.00 ml *of cupri-tartaric solution R1* .

Opiate Squill Linctus

General Notices

Compound Squill Linctus; Gee's Linctus

DEFINITION

Opiate Squill Linctus is an opalescent *oral solution* containing 33% v/v each of Squill Oxymel and Camphorated Opium Tincture in a suitable vehicle with a tolu flavour.

Extemporaneous preparation

The following formula applies.

Squill Oxymel	300 ml
Camphorated Opium Tincture	300 ml
Tolu Syrup	300 ml

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.013 to 0.020% w/v.

TESTS

Ethanol content

18.0 to 22.0% v/v, Appendix VIII F.

ASSAY

To 12 g add 5 ml of *water* and 1 ml of 5M *ammonia* and extract with 30 ml of a mixture of equal volumes of *ethanol* (*96%*) and *chloroform* and then with two 22.5-ml quantities of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*), washing each extract with the same 20 ml of a mixture of equal volumes of *ethanol* (*96%*) and *water*. Evaporate the combined extracts, extract the residue with 10 ml of *calcium hydroxide solution* , filter and wash the filter with 10 ml of *calcium hydroxide solution* . To the combined filtrate and washings add 0.1 g of *ammonium sulphate* , extract with two 10 ml quantities of *ethanol-free chloroform* , wash the combined extracts with 10 ml of *water* and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 ml of 1M *hydrochloric acid* , heat on a water bath to remove any chloroform, cool and dilute to 100 ml with *water*. To 20 ml of this solution add 8 ml of a freshly prepared 1.0% w/v solution of *sodium nitrite* , allow to stand for 15 minutes, add 12 ml of 5M *ammonia* , dilute to 50 ml with *water* and measure the *absorbance* of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared in the same manner and at the same time but using 8 ml of *water* in place of the solution of sodium nitrite. Calculate the content of $C_{17}H_{19}NO_3$ from a calibration curve prepared using quantities of 2, 4, 6 and 8 ml of a 0.008% w/v solution of *anhydrous morphine* in 0.1M *hydrochloric acid* , each diluted to 20 ml with 0.1M *hydrochloric acid* and using the method described above beginning at the words 'add 8 ml ...'. Determine the *weight per ml* of the linctus, Appendix V G, and calculate the content of $C_{17}H_{19}NO_3$, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Paediatric Opiate Squill Linctus

General Notices

Opiate Linctus for Infants

DEFINITION

Paediatric Opiate Squill Linctus is an *oral solution* containing 6% v/v each of Squill Oxymel and Camphorated Opium Tincture in a suitable vehicle with a tolu flavour.

Extemporaneous preparation

The following formula applies.

Squill Oxymel	60 ml
Camphorated Opium Tincture	60 ml
Tolu Syrup	60 ml
Glycerol	200 ml
Syrup	Sufficient to produce 1000 ml

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.0024 to 0.0036% w/v.

ASSAY

Carry out the Assay described under Opiate Squill Linctus with the following modifications. Use 32 g, add 5 ml of 1M *hydrochloric acid* to the combined alkaline liquid and aqueous washings and after heating and cooling dilute to 50 ml with *water*.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Paediatric Simple Linctus

General Notices

DEFINITION

Paediatric Simple Linctus is an *oral solution* containing 0.625% w/v of Citric Acid Monohydrate in a suitable vehicle with an anise flavour.

Extemporaneous preparation

It may be prepared extemporaneously by diluting Simple Linctus with a suitable vehicle in accordance with the manufacturer's instructions.

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of free acid, calculated as citric acid monohydrate, $C_6H_8O_7,H_2O$

0.53 to 0.69% w/v.

IDENTIFICATION

Dilute 20 ml to 50 ml with *water*, add 2 g of *activated charcoal*, mix and filter. To 1 ml of the filtrate add 1 ml of *pyridine*, swirl to mix, add 5 ml of *acetic anhydride* and mix using, for example, a rotary vortex mixer. Immediately place in a water bath at about 30° for 5 minutes. A yellow colour is produced.

ASSAY

Dilute 15 g with 50 ml of *water* and titrate with 0.1M *sodium hydroxide VS* using 2 ml of *thymol blue solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 7.005 mg of $C_6H_8O_7,H_2O$. Determine the *weight per ml* of the linctus, Appendix V G, and calculate the content of $C_6H_8O_7,H_2O$, weight in volume.

LABELLING

The label indicates the pharmaceutical form as 'oral solution'.

Salbutamol Injection

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Salbutamol Injection is a sterile solution of Salbutamol Sulphate in Water for Injections.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of salbutamol, $C_{13}H_{21}NO_3$

90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Dilute a volume of the injection with sufficient 0.1M *hydrochloric acid* to produce a solution containing the equivalent of 0.004% w/v of salbutamol. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 276 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 50 volumes of *ethyl acetate*, 30 volumes of *propan-2-ol*, 16 volumes of *water* and 4 volumes of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 2 µl of each of the following solutions. For solution (1) evaporate a suitable volume of the injection to dryness using a rotary evaporator, wash the residue with four 5-ml quantities of *absolute ethanol*, filter, evaporate the filtrate to dryness and dissolve the residue in sufficient *water* to produce a solution containing the equivalent of 0.1% w/v of salbutamol. Solution (2) contains 0.12% w/v of *salbutamol sulphate BPCRS*. After removal of the plate, allow it to dry in air until the solvent has evaporated, place it in an atmosphere saturated with *diethylamine* for a few minutes and spray with *diazotised nitroaniline solution*. The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Dilute a volume containing the equivalent of 0.5 mg of salbutamol to 50 ml with *water*, add 1 ml of 5M *ammonia*, 1 ml of a 3% w/v solution of *4-aminophenazone*, 10 ml of a 2% w/v solution of *potassium hexacyanoferrate*(*III*) and 10 ml of *chloroform*, shake and allow to separate. An orange-red colour is produced in the chloroform layer.

D. A volume containing the equivalent of 1 mg of salbutamol yields the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Acidity

pH, 3.4 to 5.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection, if necessary, with the mobile phase to produce a solution containing the equivalent of 0.005% w/v of salbutamol. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.0004% w/v of *salbutamol impurity B EPCRS* and 0.0005% w/v of *salbutamol sulphate EPCRS* in the mobile phase. For solution (1) allow the chromatography to proceed for 25 times the retention time of salbutamol (retention time of salbutamol, about 1.9 minutes).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with spherical *end-capped octylsilyl silica gel for chromatography* (5 µm) with a specific surface area of 335 m^2 per g, a pore size of 10 nm and a carbon loading of 11.7% (Waters Symmetry C8 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.287% w/v of *sodium heptanesulphonate* and 0.25% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.65 with 2M *orthophosphoric acid* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0

In the chromatogram obtained with the solution (1) the area of any peak with a retention time relative to salbutamol of about 2.7 is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%), the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

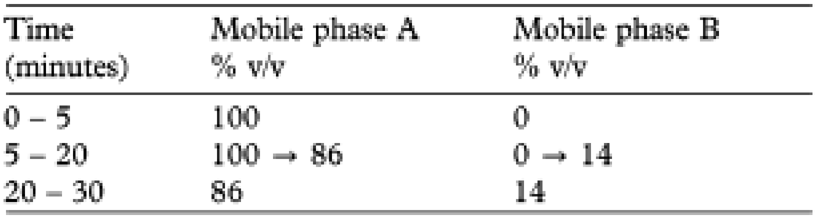
Salbutamol ketone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of the injection solution, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.050% w/v of salbutamol. Solution (2) contains 0.00025% w/v of *salbutamol ketone impurity BPCRS* in *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C8 is suitable) maintained at 30°, (b) as the mobile phase with a flow rate of 1 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 276 nm.

Mobile phase A A mixture of 1.5 volumes of *propan-2-ol* and 98.5 volumes of 0.1M *ammonium acetate* adjusted to pH 4.5 with *glacial acetic acid*.

Mobile phase B *propan-2-ol*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v
0 – 5	100	0
5 – 20	100 → 86	0 → 14
20 – 30	86	14

In the chromatogram obtained with solution (1) the area of any peak corresponding to salbutamol ketone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection with the mobile phase to produce a solution containing the equivalent of 0.0025% w/v of salbutamol. Solution (2) contains 0.003% w/v of *salbutamol sulphate BPCRS* in the mobile phase. Solution (3) contains 0.003% w/v of *salbutamol sulphate BPCRS* and 0.003% w/v of *2-*tert-*butylamino-1-(4-hydroxy-3-methylphenyl)ethanol sulphate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with spherical particles of silica, 5 µm in diameter, the surface of which has been modified with chemically-bonded nitrile groups (Spherisorb CN is suitable), (b) as the mobile phase with a flow rate of 2.0 ml per minute a mixture of 15 volumes of *propan-2-ol*, 300 volumes of 0.05M *ammonium acetate* and 685 volumes of *water* the pH of the mixture being adjusted to 4.5 with *glacial acetic acid* and (c) a detection wavelength of 276 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 1.5.

Calculate the content of $C_{13}H_{21}NO_3$ using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of salbutamol.

Salbutamol Nebuliser Solution

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Salbutamol Nebuliser Solution is a solution of Salbutamol Sulphate in Water for Injections. *The nebuliser solution complies with the requirements stated under Preparations for Inhalation and with the following requirements.*

Content of salbutamol, $C_{13}H_{21}NO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute the solution being examined with sufficient 0.1M *hydrochloric acid* to produce a solution containing the equivalent of 0.008% w/v of salbutamol. The *light absorption* of the resulting solution, Appendix II B, in the range 230 nm to 350 nm exhibits a maximum only at 276 nm.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) corresponds to the salbutamol peak in the chromatogram obtained with solution (3).

C. Dilute the solution being examined with sufficient *water* to produce a solution containing the equivalent of 0.025% w/v of salbutamol. The resulting solution yields reaction A characteristic of *sulphates*, Appendix VI.

TESTS

Acidity

pH, 3.0 to 5.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of the nebuliser solution with sufficient of the mobile phase to produce a solution containing the equivalent of 0.05% w/v of salbutamol. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.0004% w/v of *salbutamol impurity B EPCRS* and 0.0005% w/v of *salbutamol sulphate EPCRS* in the mobile phase. For solution (1) allow the chromatography to proceed for 25 times the retention time of salbutamol (retention time of salbutamol, about 1.9 minutes).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with spherical *end-capped octylsilyl silica gel for chromatography* (5 µm) with a specific surface area of 335 m^2 per g, a pore size of 10 nm and a carbon loading of

11.7% (Waters Symmetry C8 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.287% w/v of *sodium heptanesulphonate* and 0.25% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.65 with 2M *orthophosphoric acid* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any such peaks is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

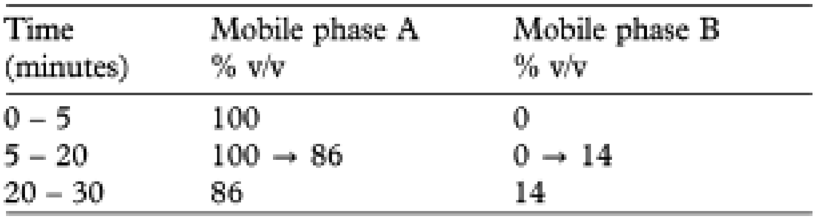
Salbutamol ketone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of the nebuliser solution, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.050% w/v of salbutamol. Solution (2) contains 0.00025% w/v of *salbutamol ketone impurity BPCRS* in *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C8 is suitable) maintained at 30°, (b) as the mobile phase with a flow rate of 1 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 276 nm.

Mobile phase A A mixture of 1.5 volumes of *propan-2-ol* and 98.5 volumes of 0.1M *ammonium acetate* adjusted to pH 4.5 with *glacial acetic acid*.

Mobile phase B *propan-2-ol*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v
0 – 5	100	0
5 – 20	100 → 86	0 → 14
20 – 30	86	14

In the chromatogram obtained with solution (1) the area of any peak corresponding to salbutamol ketone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Dilute a volume of the nebuliser solution containing the equivalent of 4 mg of salbutamol to 50 ml with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 276 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the content of $C_{13}H_{21}NO_3$ in the solution from the absorbance obtained from a solution prepared by diluting 1 volume of a 0.1% w/v solution of *salbutamol sulphate BPCRS* to 10 volumes with 0.1M *hydrochloric acid* and from the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*.

STORAGE

Salbutamol Nebuliser Solution should be protected from light.

LABELLING

The label states the quantity of active ingredient in terms of the equivalent amount of salbutamol.

Salbutamol Oral Solution

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Salbutamol Oral Solution is a solution of Salbutamol Sulphate in a suitable flavoured vehicle. *The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.*

Content of salbutamol, $C_{13}H_{21}NO_3$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

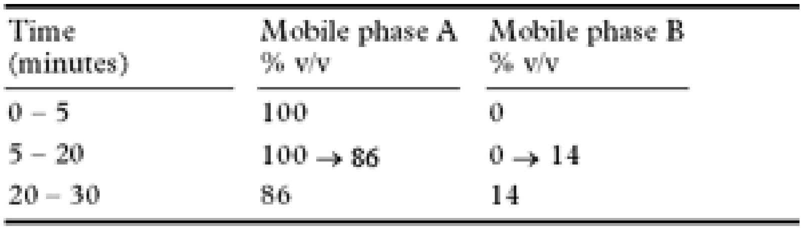
2-*tert*-Butylamino-1-(4-hydroxy-3-methylphenyl)ethanol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add to a volume of the oral solution containing the equivalent of 5 mg of salbutamol sufficient of the mobile phase to produce 50 ml, mix, filter through a glass microfibre filter (Whatman GF/C is suitable) and use the filtrate. Solution (2) is a 0.000050% w/v solution of *2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol sulphate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C8 is suitable) maintained at 30°, (b) a linear gradient elution with the conditions described below with a flow rate of 1 ml per minute and (c) a detection wavelength of 276 nm.

Mobile phase A A mixture of 98.5 volumes of 0.1M *ammonium acetate* adjusted to pH 4.5 with *glacial acetic acid* and 1.5 volumes of *propan-2-ol*.

Mobile phase B *propan-2-ol*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v
0 – 5	100	0
5 – 20	100 → 86	0 → 14
20 – 30	86	14

In the chromatogram obtained with solution (1) the area of any peak corresponding to

2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography* Appendix III D, using the following solutions. For solution (1) mix a quantity of the oral solution containing the equivalent of 2 mg of salbutamol with sufficient of the mobile phase to produce 50 ml and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) contains 0.004% w/v of *salbutamol BPCRS* in the mobile phase.

The chromatographic procedure described under 2-*tert*-Butylamino-1-(4-hydroxy-3-methylphenyl)ethanol sulphate may be used.

Calculate the content of $C_{13}H_{21}NO_3$ in the oral solution using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol BPCRS*.

STORAGE

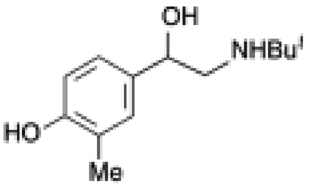
Salbutamol Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of salbutamol.

IMPURITIES

The impurity limited by this monograph is:



A. 2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol.

Salbutamol Powder for Inhalation

General Notices

DEFINITION

Salbutamol Powder for Inhalation consists of Salbutamol Sulphate in *microfine powder* either alone or admixed with Lactose. It may be presented either as pre-metered units for use in a designated powder inhaler or as a powder reservoir within a metered-dose powder inhaler.

The powder for inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRE-METERED UNITS

DEFINITION

Salbutamol pre-metered unit powder inhalers consist of Salbutamol Sulphate in *microfine powder* either alone or admixed with Lactose in a suitable container for use within a suitable device.

PRODUCTION

Complies with the requirements for Uniformity of delivered dose stated under Preparations for Inhalation using the method described in the European Pharmacopoeia or other methodology where justified and authorised.

Content of salbutamol, $C_{13}H_{21}NO_3$

95.0 to 105.0% of the stated amount per pre-metered unit.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the powder for inhalation containing the equivalent of 1 mg of salbutamol in 10 ml of *water*.

(2) 0.010% w/v of *salbutamol sulphate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel G* (Merck plates are suitable).

(b) The mobile phase is a mixture of 4 volumes of 13.5M *ammonia*, 16 volumes of *water*, 30 volumes of *propan-2-ol* and 50 volumes of *ethyl acetate*.

(c) Application volume of 5 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate, allow it to dry in air, spray with a 0.1% w/v solution of *3-methylbenzothiazolin-2-one hydrazone hydrochloride* in *methanol (90%)* and dry in air for 10 minutes. Spray the plate with a 2% w/v solution of *potassium hexacyanoferrate(III)* in a mixture of 1 volume of 18M *ammonia* and 3 volumes of *water* and spray again with the 0.1% w/v solution of *3-methylbenzothiazolin-2-one hydrazone hydrochloride* in *methanol (90%)*.

VALIDITY

The spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (3).

C. Dissolve 0.25 g in 5 ml of *water*. Add 5 ml of 6M *ammonia* and heat in a water bath at 80° for 10 minutes. An orange-red colour is produced.

D. Dissolve about 45 mg in 5 ml of *water*. The resulting solution yields reaction A characteristic of *sulphates*, Appendix VI.

TESTS

Related Substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powder for inhalation in sufficient mobile phase to produce a solution containing 0.020% w/v of Salbutamol Sulphate and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase, dilute 3 volumes to 10 volumes with the mobile phase.

(3) 0.00004% w/v of *salbutamol sulphate BPCRS* in the mobile phase.

(4) 0.00016% w/v of *salbutamol impurity F EPCRS* in the mobile phase.

(5) 0.00004% w/v of each of *salbutamol sulphate BPCRS* and *salbutamol impurity B EPCRS* in the mobile phase.

(6) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase, dilute 1 volumes to 20 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (15 cm × 3.9 mm) packed with *spherical end-capped octylsilyl silica gel for chromatography* (5 µm) (Symmetry C8 is suitable),

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 220 nm.

(f) Injection volume of 20 µl for each solution.

MOBILE PHASE

A mixture of 22 volumes of *acetonitrile R1* and 78 volumes of a solution containing 0.287% w/v of *sodium heptanesulphonate* and 0.25% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.7 with 2M *orthosphosphoric acid.*

Allow the chromatography to proceed for 25 times the retention time of the principal peak.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the two principal peaks is at least 3.0. The retention time of the peak due to Salbutamol is about 2 minutes.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to salbutamol impurity F is not greater than the area of the peak in the chromatogram obtained with solution (4) (0.8%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (6) (0.05%).

The total related substances are not greater than 2.0%.

Uniformity of delivered dose

Complies with the requirements stated under Powders for Inhalation using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Collect single doses of the preparation being examined using the procedure described under Powders for Inhalation, Uniformity of delivered dose and dissolve the collected dose in sufficient mobile phase to produce a solution containing the equivalent of 0.00009% w/v of salbutamol.

(2) 0.0001% w/v of *salbutamol sulphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with the exception of run time.

DETERMINATION OF CONTENT

Calculate the content of salbutamol, $C_{13}H_{21}NO_3$, per delivered dose using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*. Repeat the procedure nine times as described for pre-metered systems under Powders for Inhalation, Uniformity of delivered dose.

Deposition of the emitted dose

Carry out the test for *aerodynamic assessment of fine particles*, Appendix XII F, using Apparatus A but determining the content of active ingredient as described below. Use 7 ml of *water* in the upper impingement chamber and 30 ml of *water* in the lower impingement chamber. Use *water* to wash the coupling tube, E, and transfer the combined solution and washings in the lower impingement chamber to a 100-ml graduated flask and dilute the combined solution and washings to 100 ml with *water*. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the diluted solution from the lower impingement chamber diluted, if necessary, with the mobile phase to produce a solution expected to contain the equivalent of 0.0003% w/v of salbutamol.

(2) 0.0003% w/v solution of *salbutamol sulphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with the exception of run time.

DETERMINATION OF CONTENT

Calculate the amount of salbutamol, $C_{13}H_{21}NO_3$, delivered to the lower impingement chamber per actuation of the device using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*. Not less than 30% of the average amount of salbutamol delivered per actuation of the device, determined in the Assay, is deposited in the lower impingement chamber.

Water

4.5 to 5.5% w/w, Appendix IX C. Use 250 mg of the contents of the units and using a mixture of 1 volume of formamide and 2 volumes of methanol as the solvent.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve the mixed contents of 20 units [blister, capsule, etc] in sufficient *water* to produce a solution containing the equivalent of 0.0001% w/v of salbutamol.

(2) 0.0001% w/v of *salbutamol sulphate BPCRS* in *water*.

(3) 0.0001% w/v of *salbutamol sulphate BPCRS* and 0.0001% w/v of *salbutamol impurity B EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of salbutamol, $C_{13}H_{21}NO_3$, using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*.

LABELLING

The label states the equivalent amount of salbutamol per unit (blister, capsule etc).

When supplied as a powder reservoir within a metered-dose powder inhaler, the powder for inhalation complies with the following requirements.

METERED-DOSE POWDER INHALERS

DEFINITION

When supplied as a powder reservoir within a metered-dose powder inhaler, Salbutamol Powder for Inhalation consists of Salbutamol Sulphate in *microfine powder* either alone or admixed with Lactose in a suitable device.

Content of salbutamol, $C_{13}H_{21}NO_3$

80.0 to 120.0% of the stated amount per delivered dose.

IDENTIFICATION

For powders for inhalation containing salbutamol sulphate

Complies with Identification tests A, B and D stated above.

For powders for inhalation containing salbutamol sulphate admixed with lactose

Complies with Identification tests A, B, C and D stated above.

TESTS

Related Substances

Complies with the requirements stated above for Pre-metered units.

Uniformity of delivered dose

Complies with the requirements stated under Powders for Inhalation using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Collect single doses of the preparation being examined using the procedure described under Powders for Inhalation, Uniformity of delivered dose and dissolve the collected dose in sufficient *water* to produce a solution containing the equivalent of 0.0001% w/v of salbutamol.

(2) 0.0001% w/v of *salbutamol sulphate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances for Pre-metered units may be used with the exception of run time.

DETERMINATION OF CONTENT

Calculate the content of salbutamol, $C_{13}H_{21}NO_3$, per delivered dose using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*. Repeat the procedure nine times as described for reservoir systems under Powders for Inhalation, Uniformity of delivered dose.

Water

For powders for inhalation containing salbutamol sulphate admixed with lactose 4.5 to 5.5% w/w, Appendix IX C. Use 50 mg of the powder for inhalation and use a mixture of 1 volume of formamide and 2 volumes of methanol as the solvent.

Deposition of the emitted dose

Complies with the requirements stated under Deposition of the emitted dose for Pre-metered units.

ASSAY

Where the label states delivered dose, use the average of the 10 individual results obtained in the test for uniformity of delivered dose.

Where the label states metered dose, carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powder in sufficient *water* to produce a solution containing the equivalent of 0.0001% w/v of salbutamol.

(2) 0.0001% w/v of *salbutamol sulphate BPCRS* in *water*.

(3) 0.0001% w/v of *salbutamol sulphate BPCRS* and 0.0001% w/v of *salbutamol impurity B EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances for Pre-metered units may be used with the exception of run time.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of salbutamol, $C_{13}H_{21}NO_3$, using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*.

LABELLING

The label states the dose in terms of the equivalent amount of salbutamol.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Salbutamol Sulphate.

Salbutamol Pressurised Inhalation

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Salbutamol Pressurised Inhalation is a suspension of either Salbutamol or Salbutamol Sulphate in a suitable liquid in a suitable pressurised container.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

Content of salbutamol, $C_{13}H_{21}NO_3$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, in the range 1650 to 400 cm^{-1} is concordant with the *reference spectrum* of either salbutamol (*RS 314*) or salbutamol sulphate (*RS 315*), as appropriate. Examine the substance as a dispersion in *potassium bromide* prepared in the following manner. Discharge the inhaler a sufficient number of times into a mortar to obtain 2 mg of Salbutamol, grind the residue thoroughly with 0.1 g of *potassium bromide*, add a further 0.2 g of *potassium bromide* and mix thoroughly.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) corresponds to the peak due to salbutamol in the chromatogram obtained with solution (3).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For pressurised inhalations containing Salbutamol use the following solution as solution (1). Discharge the inhaler a sufficient number of times into a small, dry beaker to obtain 5 mg of Salbutamol and dissolve the residue in 10 ml of the mobile phase; mix with the aid of ultrasound until the solution is clear.

For pressurised inhalations containing Salbutamol Sulphate use the following solution as solution (1). Discharge the inhaler a sufficient number of times into a small, dry beaker to obtain the equivalent of 5 mg of salbutamol and dissolve the residue in 10 ml of the mobile phase; mix with the aid of ultrasound until the solution is clear.

For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.0004% w/v of *salbutamol impurity B EPCRS* and 0.0005% w/v of *salbutamol sulphate EPCRS* in the mobile phase. For solution (1) allow the chromatography to proceed for 25 times the retention time of salbutamol (retention time of salbutamol, about 1.9 minutes).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with spherical *end-capped octylsilyl silica gel for chromatography* (5 µm) with a specific surface area of 335 m^2 per g, a pore size of 10 nm and a carbon loading of 11.7% (Waters Symmetry C8 is suitable), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.287% w/v of *sodium heptanesulphonate* and 0.25% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.65 with 2M *orthophosphoric acid* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the sum of the areas of any such peaks is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

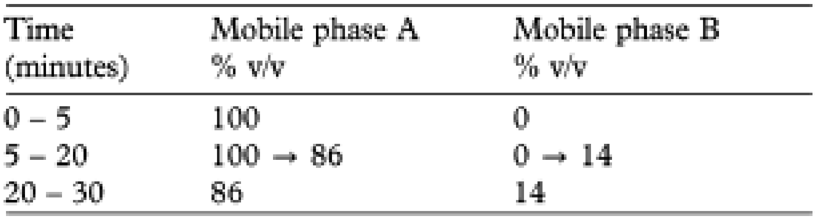
Salbutamol ketone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a quantity of solution (1) prepared above in the test for Related substances, with sufficient *water* to produce a solution containing the equivalent of 0.050% w/v of salbutamol. Solution (2) contains 0.00025% w/v of *salbutamol ketone impurity BPCRS* in *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS C8 is suitable) maintained at 30°, (b) as the mobile phase with a flow rate of 1 ml per minute the changing proportions of mobile phases A and B described below and (c) a detection wavelength of 276 nm.

Mobile phase A A mixture of 1.5 volumes of *propan-2-ol* and 98.5 volumes of 0.1M *ammonium acetate* adjusted to pH 4.5 with *glacial acetic acid*.

Mobile phase B *propan-2-ol*.



Time (minutes)	Mobile phase A % v/v	Mobile phase B % v/v
0 – 5	100	0
5 – 20	100 → 86	0 → 14
20 – 30	86	14

In the chromatogram obtained with solution (1) the area of any peak corresponding to salbutamol ketone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Deposition of the emitted dose

Carry out the test for *aerodynamic assessment of fine particles*, Appendix XII C7, using Apparatus A but determining the content of active ingredient as described below.

For pressurised inhalations containing Salbutamol use 7 ml of *methanol* in the upper impingement chamber and 30 ml of *methanol* in the lower impingement chamber. Use *methanol* to wash the coupling tube, E, and transfer the combined solution and washings in the lower impingement chamber to a 100 ml graduated flask containing 22.5 ml of a 0.1% w/v solution of *ammonium acetate*, rinsing the chamber with *methanol*, and dilute the combined solution and washings to 100 ml with *methanol*.

For pressurised inhalations containing Salbutamol Sulphate use 7 ml of *water* in the upper impingement chamber and 30 ml of *water* in the lower impingement chamber. Use a mixture of equal volumes of *methanol* and *water* to wash the coupling tube, E, and transfer the combined solution and washings in the lower impingement chamber to a 100 ml graduated flask containing 22.5 ml of a 0.1% w/v solution of *ammonium acetate*, rinsing the chamber with a mixture of equal volumes of *methanol* and *water*, and dilute the combined solution and washings to 100 ml with *water*.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0006% w/v of *2*-tert-*butylamino-1-*(*4-hydroxy-3-methylphenyl*)*ethanol sulphate BPCRS* and 0.0005% w/v of *salbutamol BPCRS* in the mobile phase. Solution (2) is a 0.0005% w/v solution of *salbutamol BPCRS* in the mobile phase. For solution (3) use the diluted solution from the lower impingement chamber.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 225 volumes of a 0.1% w/v solution of *ammonium acetate* and 800 volumes of *methanol* as the mobile phase with a flow rate of 2 ml per minute and (c) a detection wavelength of 276 nm.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (1) is at least 1.5.

Calculate the amount of salbutamol, $C_{13}H_{21}NO_3$, delivered to the lower impingement chamber per actuation of the valve using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol BPCRS*. Not less than 35% of the average amount of salbutamol delivered per actuation of the valve, calculated as the average of the three results determined in the Assay, is deposited in the lower impingement chamber.

ASSAY

Determine the content of active ingredient delivered by the first 10 successive combined actuations of the valve after priming.

For pressurised inhalations containing Salbutamol carry out the procedure for Content of active ingredient delivered by actuation of the valve described under Pressurised Inhalations, beginning at the words 'Remove the pressurised container from the actuator…' and ending at the words '… to the volume specified in the monograph', using 35 ml of *methanol* in the vessel. Add 22.5 ml of a 0.1% w/v solution of *ammonium acetate* to the combined solution and washings obtained from the set of 10 combined actuations and dilute to 100 ml with *methanol* (solution A).

For pressurised inhalations containing Salbutamol Sulphate carry out the procedure for Content of active ingredient delivered by actuation of the valve described under Pressurised Inhalations, beginning at the words 'Remove the pressurised container from the actuator…' and ending at the words '… to the volume specified in the monograph', using 35 ml of a mixture of equal volumes of *methanol* and *water* in the vessel. Add 22.5 ml of a 0.1% w/v solution of *ammonium acetate* to the combined solution and washings obtained from the set of 10 combined actuations and dilute to 100 ml with *water* (solution A).

Determine the amount of active ingredient in the 10 combined actuations using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0012% w/v of *2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol sulphate BPCRS* and 0.001% w/v of *salbutamol BPCRS* in the mobile phase. Solution (2) contains 0.001% w/v of *salbutamol BPCRS* in the mobile phase. For solution (3) use solution A.

The chromatographic conditions described under Deposition of the emitted dose may be used.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (1) is at least 1.5.

Calculate the average content of $C_{13}H_{21}NO_3$ delivered by a single actuation of the valve using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol BPCRS*.

Determine the content of active ingredient a second and a third time by repeating the procedure on the middle 10 and on the last 10 successive combined actuations of the valve, as estimated from the number of deliveries available from the container as stated on the label. For each of the three determinations the average content of $C_{13}H_{21}NO_3$ delivered by a single actuation of the valve is within the limits stated under Content of salbutamol.

LABELLING

The label on the container states (1) whether the preparation contains Salbutamol or Salbutamol Sulphate; (2) where applicable, that the preparation does not contain chlorofluorocarbon propellants (CFCs).

When the active ingredient is Salbutamol Sulphate, the quantity is stated in terms of the equivalent amount of salbutamol.

Salbutamol Tablets

General Notices

Action and use

Beta$_2$-adrenoceptor agonist; bronchodilator.

DEFINITION

Salbutamol Tablets contain Salbutamol Sulphate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of salbutamol, $C_{13}H_{21}NO_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method described under Related substances applying separately to the plate 2 µl of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 10 mg of salbutamol with 10 ml of *methanol* (*80%*) and filter. Solution (2) contains 0.12% w/v of *salbutamol sulphate BPCRS*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing the equivalent of 2.5 mg of salbutamol with 50 ml of a 2% w/v solution of *sodium tetraborate*, add 1 ml of a 3% w/v solution of *4-aminophenazone*, 10 ml of a 2% w/v solution of *potassium hexacyanoferrate*(*III*) and 10 ml of *chloroform*, shake and allow to separate. An orange-red colour is produced in the chloroform layer.

C. Shake a quantity of the powdered tablets containing the equivalent of 4 mg of salbutamol with 10 ml of *water* and filter. The filtrate yields the reactions characteristic of *sulphates*, Appendix VI.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 3 volumes of 13.5M *ammonia*, 18 volumes of *water*, 35 volumes of *ethyl acetate*, 45 volumes of *propan-2-ol* and 50 volumes of *4-methylpentan-2-one* as the mobile phase but allowing the solvent front to ascend 18 cm above the line of application. Apply separately to the plate 10 µl of each of the following solutions. For solution (1) shake a quantity of the tablets containing the equivalent of 48 mg of salbutamol with 60 ml of *ethanol* (*50%*) for 30 minutes, filter, evaporate to dryness using a rotary evaporator and gentle heat and dissolve the residue in 2 ml of *water*; if the residue is coloured, pass the final solution through a column (3 cm × 6 mm) packed with *activated acid aluminium oxide* (Brockmann Grade I is suitable). Solution (2) contains 0.058% w/v of *salbutamol sulphate*

BPCRS in *water*. Solution (3) contains 0.022% w/v of *salbutamol sulphate BPCRS* in *water*. After removal of the plate, allow it to dry in air until the solvent has evaporated and spray with a 0.1% w/v solution of *3-methylbenzothiazolin-2-one hydrazone hydrochloride* in *methanol* (*90%*) followed by a 2% w/v solution of *potassium hexacyanoferrate*(*III*) in a mixture of 1 volume of 18M *ammonia* and 3 volumes of *water* and spray again with the solution of methylbenzothiazolinone hydrazone hydrochloride. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (2%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.75%).

Uniformity of content

Tablets containing the equivalent of 2 mg or less of salbutamol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III A, using the following solutions. Solution (1) contains 0.060% w/v of *2*-tert-*butylamino-1-*(*4-hydroxy-3-methylphenyl*)*ethanol sulphate BPCRS* and 0.060% w/v of *salbutamol sulphate BPCRS* in the mobile phase. Solution (2) contains 0.0024% w/v of *salbutamol sulphate BPCRS* in *water*. For solution (3) add 50 ml of *water* to one tablet, shake for 1 hour, add sufficient *water* to produce 100 ml, mix, centrifuge and use the supernatant liquid.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with spherical particles of silica, 5 µm in diameter, the surface of which has been modified with chemically-bonded nitrile groups (Spherisorb CN is suitable), (b) as the mobile phase with a flow rate of 2.0 ml per minute a mixture of 65 volumes of *water*, 30 volumes of 0.05M *ammonium acetate* and 5 volumes of *propan-2-ol*, the pH of the mixture being adjusted to 4.5 with *glacial acetic acid*, and (c) a detection wavelength of 276 nm.

Calculate the content of $C_{13}H_{21}NO_3$ in each tablet using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*. The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (1) is at least 1.5.

ASSAY

For tablets containing the equivalent of more than 2 mg of salbutamol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.048% w/v of *2*-tert-*butylamino-1-*(*4-hydroxy-3-methylphenyl*)*ethanol sulphate BPCRS* and 0.048% w/v of *salbutamol sulphate BPCRS* in *methanol* (*10%*). Solution (2) contains 0.048% w/v of *salbutamol sulphate BPCRS* in *water*. For solution (3) shake 10 tablets with 100 ml of *water* for 1 hour, add sufficient *water* to produce a solution containing the equivalent of 0.040% w/v of salbutamol, mix, centrifuge and use the supernatant liquid.

The chromatographic procedure described under Uniformity of content may be used.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (1) is at least 1.5.

Calculate the content of $C_{13}H_{21}NO_3$ using the declared content of $C_{13}H_{21}NO_3$ in *salbutamol sulphate BPCRS*.

For tablets containing the equivalent of 2 mg or less of salbutamol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of salbutamol.

Salicylic Acid Collodion

General Notices

DEFINITION

Salicylic Acid	120 g
Flexible Collodion	Sufficient to produce 1000 ml

The collodion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of salicylic acid, $C_7H_6O_3$

13.0 to 15.8% w/w.

ASSAY

Dilute 2 g to 200 ml with *acetone* and to 2 ml of this solution add 35 ml of *acetate buffer pH 2.45* and 4 ml of a freshly prepared 0.5% w/v solution of *iron(III) chloride hexahydrate*. Dilute to 50 ml with *acetate buffer pH 2.45*, filter, discarding the first 10 ml of the filtrate, and measure the *absorbance* of the resulting solution at the maximum at 525 nm, Appendix II B. Calculate the content of $C_7H_6O_3$ from the *absorbance* obtained by repeating the operation using 2 ml of a 0.12% w/v solution of *salicylic acid* in *ethanol* (*96%*) and beginning at the words 'add 35 ml of *acetate buffer pH 2.45* ...'.

Salicylic Acid Ointment

General Notices

DEFINITION

Salicylic Acid Ointment contains 2% w/w of Salicylic Acid in a suitable water-emulsifying basis.

Extemporaneous preparation

The following formula and directions apply.

Salicylic Acid, finely sifted	20 g
Wool Alcohols Ointment	980 g

Melt the Wool Alcohols Ointment, gradually add the Salicylic Acid and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of salicylic acid, $C_7H_6O_3$

1.9 to 2.1% w/w.

IDENTIFICATION

Shake 1 g with 10 ml of *water*, filter and add to the filtrate *iron(III) chloride solution R1*; an intense reddish violet colour is produced which persists on the addition of 6M *acetic acid*. Add 2M *hydrochloric acid*; the colour disappears and a white, crystalline precipitate is produced.

ASSAY

Dissolve 10 g in a mixture of 20 ml of *ethanol (96%)*, previously neutralised to *phenol red solution*, and 20 ml of *ether* and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 13.81 mg of $C_7H_6O_3$.

Selegiline Oral Solution

General Notices

Action and use

Monoamine oxidase type B inhibitor; treatment of Parkinson's disease.

DEFINITION

Selegiline Oral Solution is a solution of Selegiline Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of selegiline hydrochloride, $C_{13}H_{18}ClN$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

(*S*)-Selegiline

Carry out the method for *liquid chromatography*, Appendix III A, using the following solutions. For solution (1) add to a weighed quantity of the oral solution containing 20 mg of Selegiline Hydrochloride 1 ml of *propan-2-ol* and 10 µl of *butylamine*, dilute to 20 ml with the mobile phase, shake thoroughly, filter and use the filtrate. For solution (2) dissolve 8 mg of (RS)-*selegiline hydrochloride EPCRS* in a mixture of 10 µl of *butylamine* and 1 ml of *propan-2-ol* and dilute to 20 ml with the mobile phase. For solution (3) dilute 0.5 ml of solution (2) to 20 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *silica gel OD for chiral separation* (Chiralcel OD is suitable), (b) as the mobile phase at a flow rate of 0.5 ml per minute a mixture of 0.2 volume of *propan-2-ol* and 99.8 volumes of *cyclohexane* and (c) a detection wavelength of 220 nm.

Inject 20 µl of each solution. When the chromatograms are recorded in the prescribed conditions, the retention time of (*S*)-selegiline is about 10 minutes. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained with solution (3) is about 10% of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks corresponding to (*S*)-selegiline and (*R*)-selegiline is at least 1.5. If necessary, adjust the concentration of propan-2-ol in the mobile phase.

In the chromatogram obtained with solution (1), any peak corresponding to (*S*)-selegiline is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.5%).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III D, using a *TLC silica gel F_{254} plate* and a mixture of 0.5 volume of 13.5M *ammonia*, 10 volumes of *1,4-dioxan*, 10 volumes of *propan-2-ol*, 10 volumes of *toluene* and 30 volumes of *xylene* as the mobile phase. Use an unlined tank and add the mobile phase immediately before placing the plate in the tank. Apply separately to the plate 50 µl of each of the following solutions. For solution (1) adjust the pH of a quantity of the oral solution containing 10 mg of Selegiline Hydrochloride to 12 with 1M *sodium hydroxide*, add 2 ml of *chloroform*, shake for 30 minutes, allow to separate and use the chloroform layer. Prepare solution (2) in the same manner as solution (1) but using 4 ml of a 0.25% w/v solution of *selegiline hydrochloride BPCRS* in 0.1M *hydrochloric acid* in place of the oral solution. For solution (3) adjust the pH of 1 ml of a 0.025% w/v solution of *selegiline hydrochloride BPCRS* in 0.1M *hydrochloric acid* to 12 with 1M *sodium hydroxide*, add 10 ml of *chloroform*, shake for 30 minutes, allow to separate and use the chloroform layer. For solution (4) dilute 2 volumes of solution (3) to 5 volumes with *chloroform*. For solution (5) adjust the pH of 2 ml of a 0.025% w/v solution of *methylamphetamine hydrochloride* in 0.1M *hydrochloric acid* to 12 with 1M *sodium hydroxide*, add 10 ml of *chloroform*, shake for 30 minutes, allow to separate and use the chloroform layer.

After removal of the plate, allow it to dry in air, spray with a solution prepared by mixing 2 volumes of a solution in *acetone* containing 10% w/v of *iron(III) chloride* and 4% w/v of *iodine* and 1 volume of a 40% w/v solution of *(+)-tartaric acid* in *water* and allowing to stand for 15 minutes before use. Examine the plate in daylight immediately after spraying. In the chromatogram obtained with solution (1), any spot corresponding to methylamphetamine is not more intense than the spot in the chromatogram obtained with solution (5) (1%), any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 10 ml of a mixture of equal volumes of *acetonitrile* and *methanol* to a weighed quantity of the oral solution containing 10 mg of Selegiline Hydrochloride, mix with the aid of ultrasound for 5 minutes, add 40 ml of a mixture of equal volumes of *acetonitrile* and *methanol* and shake mechanically for 15 minutes. Add sufficient *water* to produce 100 ml and dilute 5 volumes of the resulting solution to 10 volumes with the mobile phase. Solution (2) contains 0.005% w/v of *selegiline hydrochloride BPCRS* in the mobile phase. Solution (3) contains 0.005% w/v of *selegiline hydrochloride BPCRS* and 0.001% w/v of *nortriptyline hydrochloride EPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm), (b) as the mobile phase with a flow rate of 1 ml per minute a mixture prepared in the following manner: dilute 250 ml of *methanol* and 250 ml of *acetonitrile* to 1000 ml with a solution prepared by dissolving 4 ml of *butylamine* in 900 ml of *water*, adjusting the pH to 6.5 with *acetic acid*, and adding sufficient *water* to produce 1000 ml and (c) a detection wavelength of 215 nm.

Inject 20 µl of each solution.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

Determine the *weight per ml* of the oral solution, Appendix V G, and calculate the content of $C_{13}H_{18}ClN$, weight in volume, using the declared content of $C_{13}H_{18}ClN$ in *selegiline hydrochloride BPCRS*.

STORAGE

Selegiline Oral Solution should not be refrigerated.

Selegiline Tablets

General Notices

Action and use

Monoamine oxidase type B inhibitor; treatment of Parkinson's disease.

DEFINITION

Selegiline Tablets contain Selegiline Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of selegiline hydrochloride, $C_{13}H_{18}ClN$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Selegiline Hydrochloride with 2 ml of *water* and 1 ml of 1M *sodium hydroxide*. Extract with 10 ml of *dichloromethane*, filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. The *infrared absorption spectrum* of a thin film of the residue, Appendix II A, is concordant with the *reference spectrum* of selegiline (*RS 400*).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

(*S*)-Selegiline

Carry out the method for *liquid chromatography*, Appendix III A, using the following solutions. For solution (1) add to a quantity of the powdered tablets containing 20 mg of Selegiline Hydrochloride 1 ml of *propan-2-ol* and 10 µl of *butylamine*, dilute to 10 ml with the mobile phase, shake thoroughly, filter and use the filtrate. For solution (2) dissolve 8 mg of (RS)-*selegiline hydrochloride EPCRS* in a mixture of 10 µl of *butylamine* and 1 ml of *propan-2-ol* and dilute to 10 ml with the mobile phase. For solution (3) dilute 0.5 ml of solution (2) to 20 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *silica gel OD for chiral separation* (Chiralcel OD is suitable), (b) as the mobile phase with a flow rate of 0.5 ml per minute a mixture of 0.2 volumes of *propan-2-ol* and 99.8 volumes of *cyclohexane* and (c) a detection wavelength of 220 nm.

Inject 20 µl of each solution. When the chromatograms are recorded in the prescribed conditions, the retention time of (*S*)-selegiline is about 10 minutes. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained with solution (3) is about 10% of the full scale of the recorder. The test is not valid unless the *resolution factor* between the peaks corresponding to (*S*)-selegiline and (*R*)-selegiline in the chromatogram obtained with solution (2) is at least 1.5. If necessary, adjust the concentration of propan-2-ol in the

mobile phase.
